Non-competitive exhibits were not numerous, but Messrs. Fortheringham and King, Dumfries, and T. Kennedy and Co., Dumfries, sent fine tables of plants and flowers; J. Palmer and Son, Ltd., Annan, had splendid Roses; and Mr. J. Kennedy, Dumfries, new Cactus Dahlias; and Mr. J. McGuffog, gardener to the Countess of Selkirk, Balmae, sent fine Onions on exhibition.

One of the features of the open classes was the competition with tables of plants arranged for decorative effect. There were four competitors, and the first prize, the Burgh of Dumfries Challenge Cup, with a sum of money, went to James Service and Sons, Maxwelltown, Dumfries, with a beautiful arrangement of excellently grown plants; Mr. J. M. Stewart, Mollance, who won the cup last year, was second; Mr. J. Houston, Crichton Royal Institution, another former winner, was third; and W. Middleton and Son, Dumfries, made a good fourth.

In groups, Messrs. Service again led; Mr. R. Grigor, Woodlands, being second, and Mr. Houston third. In the open class, Palmer and Son were first for twenty-four Roses; W. Learmont and Son second, and J. Bogie and Son third. For eighteen Teas, Mrs. Rutherford, Crichton House, was first, and W. Learmont and Son second. J. Bogie and Son were first for a collection of Dahlias; Mr. J. M. Stewart being first for Cactus Dahlias, followed closely by J. Bogie and Son. Kerr Bros., Dumfries, were first for Carnations and Picotees.

Sweet Peas were extensively and well shown all through the show, the winners in the open class being, first, W. Learmont and Son, Dumfries; second, W. Adamson, Woodbank; third, W. Middleton and Son. Herbaceous plants were capitally shown, W. Middleton and Son being placed first; second, T. Kennedy and Co.; third, W. McGuffog, Balmae.

In the florists' classes there was great interest taken in the class for best and most tastefully arranged table decorations, consisting of "cut flowers and foliage only." After long consideration the first prize was awarded by the judges to Miss Jean Service, daughter of the president, for an elegant arrangement of Carnations, Roses, Sweet Peas, and Gypsophila; Kerr Bros. came second with a pleasing table, principally of Montbretia, which was also greatly admired. Mrs. L. Rutherford was third with an arrangement which found great favour with many.

The baskets and bouquets and glasses of flowers were exceptionally fine, the leading prizewinners being Mr. K. Mackenzie, Conbeath; Kerr Bros., R. Grigor, Middleton and Son, and Miss Rutherford, the last named winning in a strong competition for the most tasteful epergne. Pot plants were much better than last year, but there is still room for improvement. The leading prizetakers were C. McIver, Lincluden; J. Mundell, Allanbank; J. Houston, R. Grigor, J. M. Stewart, and R. Young, Gracefield.

Cut flowers in the classes for gardeners and amateurs were a large section, and mainly of wonderful quality, considering the disastrous weather, which had been so stormy that the large marquee was blown down a day before the show. The principal winners were J. Duff, Threave; J. M. Stewart, D. Whitelaw, Locharbriggs; J. Wright, Locharbriggs; R. Young, J. Houston,

J. Henderson, Elmbank; J. and W. Tweedie, Mouswald; K. Mackenzie, and Miss Whitelaw, Summerhill.

Fruit was not so plentiful as last year, in many gardens there being a complete failure of outdoor stuff. For a collection of fruit J. M. Stewart was first, J. Duff being second. For a collection of outdoor fruit B. Anderson, Glenlair, was first, and J. Duff second. Grapes were very fine. Black Hamburgh: First, J. Henderson; second, A. Robertson, Closeburn. Black Grapes (Hamburghs excluded): First and second, M. B. McDonald, Langholm. Muscats: First, J. Duff; second, A. Robertson. White Grapes (Muscats excluded): First, J. Duff; second, J. Henderson. Grapes, best bloom: First, J. Houston; second, A. Robertson. Grapes, best flavour: First, M. B. McDonald; second, J. Duff. In the other classes Messrs. Stewart, McIver, Duff, Rutherford, and McGuffog were the winners.

Vegetables were of high quality, Leeks, Turnips, and Onions being all capitally grown, the first being of really exceptional quality, those of Mr. J. M. Stewart in particular being remarked upon the judge. Mr. J. Duff had the best collection: second, J. Houston. In the smaller collection, W. Anderson, Collin, was first; second, R. Middleton, Kirkcudbright. Messrs. Duff, Middleton, Stewart, Mackenzie, Whitlaw, McIver, McGuffog, Henderson, and Houston were among the other prizewinners in the vegetable section.

Amateurs showed a marked advance on former years, and their vegetables and cut flowers were unusually good.—S. A.

### Bristol Gardeners'.

This association held its monthly meeting at St. John's Rooms on Thursday evening last, Mr. E. Poole, F.R.H.S., occupying the chair. The lecture for the evening was on "Bees," and was given by Mr. Jordon, of the Bristol Bee-keepers' Association. He advised bee-keepers to make a special study of these industrious insects, which would help them considerably to become successful bee-masters. Gentlemen were becoming more interested in apiculture, and were realising the advantages through keeping in their gardens a hive or two of bees for fertilising their flowers and fruit. The time at the disposal of Mr. Jordon was unfortunately too short for such an interesting subject, and he was asked to continue his lecture at some future date, which he has promised to do. A discussion followed, and a cordial vote of thanks was passed for the most enjoyable evening. Prizes for an epergne of flowers went to Mr. N. C. Dobson (gardener, Mr. Thoday), Mr. Francis Tugard (gardener, Mr. Binfield), and Mr. Ambrose. A special certificate of merit was recommended for Mr. Gilbert Howes (gardener, Mr. White) for three Pitcher plants, an ordinary one going to Mr. W. Howel Davis (gardener, Mr. Curtis) for six sections of honey.—H. K.

### Shirley (Southampton) Gardeners'.

The monthly meeting, held at the Parish Room on Monday, August 24, was devoted to a discussion on leaf fungi, opened by Mr. G. Verdon, of the Red Lodge Nurseries. The chair was taken by Mr. B. Ladhams, F.R.H.S. Mr. Verdon remarked that when they came to talk of fungi or mildew it was a very large question, for the varieties went into many thousands. Talk of it to some farmers, and they at once looked over their fields of corn in search of the brown lines or irregular spots which they had known for years as mildew. Ask the Hop-grower in Kent what was mildew, and he would tell you to look upon his Hops. Ask the laundry-maid and she might find you some on some linen. Then ask the Vine grower, and he shows you his particular variety, and the Onion man his; and the stationer and the plasterer all had their mildew or fungi to contend with. Mr. Verdon drew attention to the disease on the Thorn, Pear, Potato, and Pelargonium. A good discussion followed, in which Messrs. Jones, Ladhams, Cleveley, J. Miles (secretary), Greenslade (treasurer), and others took part. A certificate of merit was awarded to Mr. F. Snelgrove for two Zonal Pelargoniums. A vote of thanks to Mr. Verdon closed a very interesting meeting.—J. M.

### Codiaeums (Crotons).

(Continued from page 142.)

TREATMENT OF OLD PLANTS.—Large plants that have by some means or other lost most of their leaves, and become straggly and unsightly, may be taken in hand at once. Allow the plants in question to become somewhat dry, and then prune them back; place them in a shady spot in the house, and keep the wood moist by syringing them as often as circumstances will permit. Just as the buds are beginning to burst knock the plants out of their pots, and cut off a couple of inches of roots and soil all round the ball; then with a pointed stick pick out as much of the old soil

as possible, reducing the ball so that it can be got comfortably into a pot two sizes less.

For potting use the compost previously advised, with the addition of a small quantity of  $\frac{1}{2}$  in bones. Continue to syringe the plants often until the growth is well advanced, and then treat along with the other plants in the house. By March the plants will have rooted sufficiently to admit of being shifted into their original size of pot; if, however, the growth made is deemed insufficient for the size of the pot, defer the operation until August.

**TRAINING.**—Crotons are, with one or two exceptions, inclined to run up with a single stem; therefore, to form plants of a bushy nature, stopping of the shoots is necessary. Plants grown for table decoration are usually grown with a single stem; when they are too large for that purpose they can be stopped and grown on for specimens. If allowed to grow at random, the shoots, especially on large plants, grow up together in a cluster. The leaves on plants growing in this manner do not attain the size, nor develop the colour they should do, and there is generally a space just above the pot entirely devoid of foliage. To obviate this the shoots require to be tied down; a neat way to do this is to fix a wire round the pot, and tie the shoots down to it. This must be done gradually, and it will be necessary to go over the plants several times before they are brought down to the required level.

**A FEW USEFUL VARIETIES.**—In the narrow-leaved section are *Elegantissima*, *Angustifolium*, *Countess*, *Her Majesty*, *Chelsoni* (this does best grown as a standard), and *Picturatum* (requires very firm potting, otherwise it grows very straggly).

Among the newer varieties are *Gordoni* (slow grower), *Lucy* (a very graceful dark-red variety), *Mrs. Harry Green*, *Euterpe* (with interrupted leaves), *Diana*, *Elysian*, and *Hermon*; the last three varieties are very pretty, the leaves are twisted, and the colour of them yellow with light green margin.

In the medium section are *Hawkeri* (seen at its best in a young state), *Lady Zetland* (one of the hardiest, can be grown in a cool house), *Undulatus*, *Prince of Wales*, *Warreni*, and *Golden Ring*. The three latter varieties have twisted leaves; large plants of them look magnificent.

Among the broad-leaved varieties are *Nestor*, *Evansianus* (very free growing), *Disraeli*, *Thompsoni*, *Queen Victoria*, *Mrs. Aceton*, and *Mortefontaineensis*. The latter succeeds best in higher temperature than what is usually found in Croton houses. —G. R., Waddesdon.

Tree Moving Machine.

## Transplanting Large Trees.

A few large trees and shrubs are indispensable in making a new or altering an old place. An astonishing effect can be produced with them that could not otherwise be produced in a lifetime. They not only add antiquity to the scenery, but comfort to the surroundings. Unsightly objects can be quickly and effectively hidden with a screen of large trees, thus transferring the objectionable into the beautiful. Although I do not advocate the practice of taking a delicate tree from a sheltered comfortable position to an exposed one where a stone wall would hardly be weather-proof yet I know of a very handsome pair of *Araucaria imbricata* that have been transplanted and doing well up in the Derbyshire hills, and I would rather risk this than see fine specimens cut and mutilated into disfigurement because they have overgrown the positions they were originally intended to fill instead of being removed to more roomy quarters. But the question may arise as to how these ponderous living giants are to be successfully shifted. There are many contrivances intended for the above purpose, but I know none so good as the simple machine invented by Mr. Barron of Elvaston, page 226. This was first used at Elvaston about the year 1830, and has been in constant use ever since with the greatest success. The inventor of it writes:—"In the year 1831 I transplanted a Cedar of Lebanon 43ft. high and 48ft. in diameter of branches. The stem of this Cedar, which at that time was 2ft. in diameter, is now more than 10ft. in circumference, and a picture of health and vigour. A tree 72ft. high was moved more than two miles in an upright position. Yews from six to eight hundred years old have been successfully moved long distances. Oaks and Larches from 40 to 50ft. high have been moved in the middle of summer without losing a leaf. Large Spruce and Silver Firs on the limestone formation have made shoots 18in. in length the second year after removal."

I will now endeavour to write a brief description of the working of these simple machines that may be a sufficient guide to enable the ordinary intelligent novice to use them efficiently. I will take for example a tree of 8 or 10 tons. First mark out a square shaped space about 8 by 10ft., dig out the ends first to a depth of 2ft. 6in., then burrow right under the centre of the tree for the purpose of inserting a strong centre plank capable of carrying the whole tree, when this is inserted under the bole of the tree with about a foot projecting out each end for the purpose of hooking the looped end of the winding rope on. The sides may next be dug out and the end planks inserted under the bole across the centre for the purpose of carrying the side planks, which are the next to be fixed. These planks should be 6in. longer than the mass to allow corner chains to be fastened. These prevent the tree swaying while being conveyed to its future position. If the tree has a long journey or the soil of a loose nature the sides will require to be supported with straw and boards bound together with ropes similar to a cooper hooping a barrel. Should the tree be very tall, guy ropes are needed to hold it in an upright position. These should be fastened to the tree as high as possible at right angles to enable four men to steady it while being moved, or they may be fastened to each corner of the machine, or both may be required in windy weather.

The tree will now be ready for the machine, which is taken in two parts. The hind portion may be first put into position ready to receive the side beams, which are attached to the front limber part of the machines. When the machine is put together the tree will be in the centre. Rachel rollers are placed across the beams, one each side of the tree, and a double rope for winding. When these are in position and the loop end of the rope hooked on the centre plank, winding may be commenced steadily. Strong sling chains with a ring at one end and hook at the other are fastened to the side beam passing under the centre plank and hooked on the other side, and gradually hitched up as the tree is lifted, as a safeguard in case the winding gear gives way. When high enough to clear the ground, the chains may be fastened and the rollers slackened a little so that each chain takes an equal bearing. The principal weight is carried by the sling chains and centre plank.

The hole must be filled up level and planked over, or the machine will be difficult to get over the loose soil. If planks can be laid the whole distance, and horses cannot be used, men can move an immense weight, or pulleys can be brought into requisition. A square hole with the ends made slanting for the wheels to pass down may be dug with a furrow at the bottom for the centre plank to rest in, to prevent it getting fastened when the tree is lowered into its position.

The machine has to be taken to pieces as before when all the planks are removed. The furrow at the bottom must be firmly packed with earth to make a solid, flat foundation for the tree to rest on. When all is filled in the whole may be thoroughly soaked with water if necessary, and a lofty tree will require supporting with guy ropes or wire—especially in exposed positions—until fresh roots are made and the soil gets solid. It is a good plan to mulch fresh planted trees;

it is much better than using too much water. There are several different sized machines, which may be hired of Mr. Barron, Borrowash Nurseries, Derby, at moderate cost, with both experienced men and the requisite appliances, or I believe machines are made to order and sold by that firm.—G.

We are also enabled to give a few details from the pen of another practitioner, who writes of the work done at Canford Manor. The illustrations on pages 227 and 228 bear out his remarks. Thus:—

I will describe the operation of shifting the handsome *Picea nobilis*, of which a photograph has been sent with these notes. The first proceeding was to dig a wide, square, and deep trench so as to leave a ball rather more than 8ft. square, nearly the whole of which was preserved intact to a depth of 30in. Being well below the latter depth, the next step was to undermine the centre with crowbars sufficiently to admit of a stout plank 8ft. in length being thrust under, and this was duly blocked up lightly with the aid of piers formed with loose bricks. Four feet away from this on each side two other planks were similarly worked underneath the ball, and these being propped up with brick piers supported the edge of the ball when this was reduced to the desired width. The tree was then gradually undermined both ways, and planks added and bricked up as the work went on, these eventually supporting the whole weight of the tree, when the remaining subsoil was picked out. Care being taken to build these brick piers on a solid foundation, and all of one height (about 2ft.), the tree settled down on this without a hitch of any kind. While all this was being done by handy labourers, others were preparing a way out for the tree, an easy slope being needed.

Everything being thus well done, it was a comparatively easy matter to run a low strong trolley well under and close up to planks, the trolley being extra strong, capable of bearing 8 tons or more in weight, and constructed much after the pattern of the flat four-wheeled trolleys used for carrying luggage at railway stations. The bricks being knocked away the planks settle on the trolley, and the tree is ready for removal. Planks were laid for the trolley wheels to run smoothly over, but even with this aid it is not considered advisable to employ horses for drawing such heavy trees out, snatching and straining being bad for both the tackle and the trees. Instead of horses a strong "crab," or portable windlass, is used, and with this powerful aid the trolley is drawn out steadily and easily, scotches, however, being handy for stopping running back in case of either the ropes or chains snapping, as they sometimes do under the strain. Being once on the hard road planks were dispensed with, and four powerful horses managed to draw the tree to its destination.

Once more both planks and "crab" were brought into requisition. Being drawn with the aid of the latter into the exact position in which it was to remain, brick piers were once more formed under all the planks, and these supported the tree after the trolley was undermined and then drawn out. Fresh

good soil was then banked well up to the central plank, which was removed, and more soil very firmly pressed under so as to be well up to the old ball. This process was continued from the centre till all the planks were knocked away, and the tree was once more resting on the ground. Four days altogether were expended on the transplanting of this tree at a cost probably of less than £6, including horse labour.

For moving smaller trees, or any that two or four men can lift when duly prepared, Mr. Crasp (late of Canford, Dorset) had a handy invention of his own, and which is well worthy of being generally used. It consists of four elm boards, each 3ft. long, 9in. wide, and 1½in. in thickness, all being hollowed out somewhat so as to form a circular hole in the centre when put together, without, however, impairing their strength (see page 228). They are bolted together, a loop end being formed on the upper side of each bolt, and either being removed, the collar can be placed round the ball of a tree and again connected. First, however, a square trench is cut round the tree, so as to leave a ball 3ft. each way, the latter being then undermined sufficiently to admit of the collar being placed in position and connected. Each corner of this is then blocked up with bricks, and these, when the tree is undermined, support the collar and the tree. Occasionally a strong two-wheeled stone trolley with long powerful handle is run under the tree, and, the bricks being taken away, all is ready for removal. More often, though, strong cord loops are placed to each iron crook at the corners, and strong poles being passed through these two or four men lift the tree out of the hole and on to the trolley. The fresh site being duly prepared, four brick piers are again formed, the tree is lifted off the trolley on to these, soil being then firmly packed under the centre and well up to the sides, after which the collar is disconnected at one corner, the piers removed, and the tree is resting on the ground as before.—J. M. H.

Removing a *Picea nobilis* of 40 feet height.

## A Flower Show in a Far Country.

I have, during the course of a long life, seen flower shows of all sorts and descriptions, from National Rose and Temple Shows, to Chrysanthemums, and down to the modest display in the small tent on the village green; all presenting points of interest, and all capable of giving much pleasure, if not to the spectator, at least to the successful exhibitor. Last week I fell on a little local show far away in the wilds of Westmoreland, under the shadow of great mountains and close to the gleaming waters of two lovely lakes. The village is cut in two by a brawling stream; some of the houses are perched on the hill sides, and Nature has done all she can to make the place beautiful. The gardens are wind-swept, and the summer has not been favourable to the growth of fruit or flower. The new school, not yet completed, was utilised for the occasion, and made smart with coloured muslins. The big windows were unglazed, and the views from each formed a series of perfect pictures. Purple Heather under a blazing August sun must be seen to be appreciated. The day was one of a few that will stand out in this summer as an example of what a summer's day should be. Here the heat is never excessive; there is always a breeze just sufficient to give that zest to the air that makes it so welcome to lungs that constantly breathe the vitiated atmosphere of the cities of the plain.

The show was called horticultural, but I found it as a matter of fact a variety entertainment. My first glance was directed to the cut flowers, and of the flowers to the Queen, the Rose. The village grocer is the strong man in this line, but there was not much chance of distinguishing himself, as the schedule only asked for two varieties, one example of each; and funny odd Roses they were—old varieties, with W. A. Richardson exhibited as a novelty! Where Caroline Testout had sprung from I could not ascertain. Never before had I seen an exhibit of Nasturtiums (*Tropæolums*), but here there were several classes where they flaunted their orange and yellow and brown faces.

Four distinct Asters brought forth several lots, and Stocks were a strong class. Sweet Peas, too, unnamed, and all varieties massed in one vase, happily, however, arranged with additional or alien foliage. Some of the Pansies were pretty: all too stiff, and all to a man "gypsophilied," if I may use such a term.

The buttonholes were ornate and large. A poor little class of Tomatoes (only one dish) made an approach to effect; and the Leeks were thick and white and good.

Of course, a show could not be without the giant Marrow, far too big even for a pleasure barge for a fairy princess! Plenty of Cabbages and Lettuces, splashed with a deep red (a variety unknown to me); Potatoes with local names; Peas just a thought too old; and Kidney Beans pulled before their time.

"Fruit" was represented by some big, barrel-sided Apples and Rhubarb past its first freshness. But stay—yes, there were other fruits, in the children's section, collections of wild fruit. I am of an adventurous spirit, but I paused before those displays. I thought of Tommy and his sister Jane, and those berries which caused their untimely end. I recognised the Rasp—a microscope was almost necessary to see it, so tiny were the thimble-like fruits. Of mountain berries there was a store; Hazel-nuts and things in pods; but the children had done well with their trays of mosses—such variety, such beauty! What would I not have given for some of that velvety green to hide the stands of my Roses when "set up" at our home shows? such difficulty as I have in getting nice, clean, bright pieces.

The children had wild flower bouquets, and also collections of wild flowers shown, or gummed, on sheets of paper. I said it was a variety entertainment, and in a class room I found bread, tea-cakes, butter, honey, and eggs, all products of the villagers. Also sets of dolls' clothes, cut out and made by small fingers. Specimens of handwriting: "The Deserted Village" in all styles; big sheets of drawings, some black-and-white, some gay with colours; and, most practical of all, boxes each containing a well starched shirt, with two collars and a best pocket handkerchief. And knitted socks, too; and the industry of the neighbourhood in carvings in cedarwood, occupation for the long winter evenings, work for the boys when spade and rake must be laid aside. It was all so new and pretty and unusual; so simple, so unpretentious.

The officials told me that they were always so favoured by the Clerk at the Weather Office. Perhaps he is a native of these parts, and remembers the festival day when he was young, how it was made or marred by the weather. As I write, the windows of heaven are opened wide, and I can see a glassy film spreading over the meadow land in the valley. Yesterday, to-day, no one can stir abroad; the hills are blotted out, and for all I can see, the ocean might be where Skiddaw lifts his hoary head.

The few crops here are late and also light, and of that variety (Oats) which is inured to bad weather. A few belated patches of hay, which ought to have been secured before, stand in danger of being bodily landed in the lakes. It is a case for ensilage, not hay.

This is a country rich in Ferns: five varieties within a few yards of the village street, as I found. Mercury or Good-King-Henry is out on the waste land. Has it been an escape from a garden, or is this its native home? [It is native.—ED.] Beautiful weeping country! I like your smiles better than your tears.—THE MISSUS.

## Book Notice.

### The Book of the Peach.\*

This is a practical handbook on the cultivation of the Peach under glass and outdoors, by Mr. H. W. Ward, who was for twenty-five years head gardener at Longford Castle, Salisbury. In his introduction the author refers to his success as an exhibitor of collections and single dishes of choice hothouse and wall fruits at the annual summer and autumn shows held at the Crystal Palace and leading provincial towns, and the Peaches and Nectarines in the Longford collections always excited favourable comments on the part of experts. Such status is backed by

COLLAR SHUT  
READY FOR LIFTING

(See page 227.)

experience of the Peach and Nectarine on 250 yards of wall and some six glass houses, forced and cool.

The author, in the opening chapter, expresses the wonder that the Peach and Nectarine are not grown much more extensively in favourable situations out of doors throughout Great Britain and Ireland than they are, seeing that suitable aspects are available for the growth of the trees and ripening of the fruit in every walled-in garden in every county and village in the United Kingdom.

This is rather sweeping, for our author clearly has not experience of attempting growing Peaches and Nectarines in high and cold districts, for their culture against walls is very uncertain, indeed impracticable, and even under glass heat is necessary to ensure safety from spring frosts and perfect the crops in cold and wet seasons. Still, I quite agree with the dictum that in many cases Peaches and Nectarines could be grown as well now as they were at the middle of last century and long before on open walls, even in favoured positions in the northern counties of England; but to attempt their cultivation on south walls at 500ft above sea level north of the Humber is simply courting failure.

Besides, what know the present young hands of training wall trees? And in this particular point they are not helped much in the chapter on the "pruning and training the trees." Of course, gardeners ought to know their business; but in books we expect to find illustrative matter, so that those who do not know may learn. This will perhaps be rectified in future editions, for in other respects the book is thoroughly sound and practical, and I strongly advise its perusal.—G. A.

PUBLICATIONS RECEIVED.—"An Introduction to Nature-Study," by Ernest Stenhouse; Macmillan and Co., 3s. 6d. \* \* "Missouri Botanical Garden Administrative Reports for 1902." \* \* "Missouri Botanical Garden: a History," by William Tralease, LL.D. \* \* "Oxfordshire County Council: Annual Report of the Technical Instruction Committee for the year 1902-3."—August 5, 1903. \* \* "The Garden Gazette," Vol. I., No. 12, July, 1903. This Australian horticultural newspaper (published at 28, Temple Court, Collins Street, Melbourne) has now lived through its first year, and is likely to go on prosperously henceforward. It is charmingly illustrated, well conducted, and is doing a good service in Australia. \* \* "The Indian Agriculturist," containing: Planters and Rhea cultivation, Rubber plant (new), Australian fruit fly, &c.

### Hardy Fruit Garden.

**PREPARATIONS FOR STORING FRUIT.**—Although in many instances the fruit crop this season will not be a heavy one, yet what there may be to gather and store ought to receive the best treatment, especially where high culture has been given and every effort made to develop and finish well the crop. When this has been done, and the gathering carried out on careful lines, the storage of the crop is of next importance. The best place for storing fruit is undoubtedly a properly arranged fruit room with tiers of shelves for holding the fruit. The fruit-storing trays are also valuable, and these may be placed in any suitable room or structure. Fruit rooms must be scrupulously clean and sweet, therefore before any attempt is made to store fruit, thoroughly wash out the whole place, limewashing the walls, and carefully scrubbing the shelves and floor. After this allow several days for the place to thoroughly dry, throwing the doors and windows wide open for the purpose of ample ventilation. Retain nothing in the place which will cause dust, dirt, or taints of any kind.

**GATHERING FRUIT.**—To gather fruit judiciously it cannot be picked all at once, as a rule. The very early varieties of Apples, which need little or no storing, like Beauty of Bath, Irish Peach, and Lady Sudeley, which may be eaten direct from the trees, do not fully perfect every fruit at once. The forwardest only should be picked, leaving the rest to mature further. It is easily known which fruits are ready by the ease they part from the spurs, on lifting to a horizontal position. The same tests apply equally well to Pears, but it is always desirable to gather them before they are fully ripe. Just when the fruits begin to colour and can be readily detached from the trees is the best time. They may be finished in the fruit room, where they develop a melting, juicy, and rich flavour. Left too long on the trees many of the early Pears eat mealy. The fruits must not be bruised in picking, as this will be against their keeping for any length of time.

**STRAWBERRIES: OLD BEDS.**—The continuous wet weather has in many cases prevented the necessary work in clearing off runners. It is important they should be removed, together with any crop of weeds which may be springing up among them. If a further lot of plants are needed to plant new beds, a selection of the best should be made from outside rows, or wherever such can be found that have not been crowded. Cut the runners off close to the old or parent plant, and any old leaves at the same time. Should the surface roots be much exposed a mulch of decayed manure mixed with decomposed vegetable matter and wood ashes may be spread along the rows.

**PLANTING STRAWBERRIES.**—Strong rooted plants will be plentiful now, even where no special attention has been given in preparing rooted runners. Lift them from the positions where they have rooted into the soil between and outside the rows. They may be obtained with balls of soil adhering, and can be planted at once permanently in rows where they are to fruit. Should the ground not be ready for their reception, temporarily insert them in nursery beds, from which they may be readily lifted and planted a little later almost without receiving any check. Plants of new varieties received from a distance are not, unless in pots, in a condition ready for immediate permanent planting. It is, therefore, a good plan to give them nursery bed treatment for a time, carefully spreading out the roots in good soil, in which they will form tufts of fibrous roots readily, and soon be ready for transferring to fruiting quarters. Much will depend, however, on the size of the plants or rooted runners whether they are ready for autumn or spring planting.

**OUTDOOR FIGS.**—Shoots for future bearing ought to be selected from the current year's growths, those of medium strength being the best, which lay in close to the wall at full length. Growth bearing the season's crop must be stopped a few leaves beyond the fruit, such growths being cut out after the crop has been gathered, thus leaving room for the full and complete ripening of the shoots, without which a satisfactory crop the following year cannot be depended upon.

**MORELLO CHERRIES.**—These Cherries will keep a long time on the trees, providing they are protected from birds by nets, but it is possible the demand for the fruit has long exceeded the supply, and the trees, principally on walls and espalier fences, are now clear of the crop. This being so, it is desirable to direct efforts to the complete ripening of the wood for next season's crop. The first essential is to cut out the old bearing wood—that

is, if the fruit has been produced on long shoots laid in last year for the purpose, but if the fruits have been borne on spur growths, these must remain. The shoots required for fruiting are the medium sized growths of the current season. Not all these the trees produce will be required, therefore, a general thinning out must be adopted, discarding on the one hand very strong shoots, and on the other very weakly ones. Dispose the branches and shoots in their proper positions on the walls or fence, training them thinly, whereby the ripening influences of sun and air can act upon them. Growths for which no room can be found may be cut out entirely or shortened, if well placed with a view to their forming spurs. With the exception of these, train all others at full length.—EAST KENT.

### Fruit Forcing.

**CUCUMBERS: WINTER FRUITING.**—The plants from seed sown in August will now be ready to plant out. First of all, thoroughly cleanse the house, removing every particle of old soil, and scalding the whole of the interior with boiling water. Then wash the woodwork with paraffin, softsoap, or carbolic soap, limewashing the walls with hot lime and a small handful of flowers of sulphur in each pailful. Make the drainage secure with a layer of turves, previously charred or scalded. Put in hillocks or ridges of soil, and plant when the compost is warmed through. Shade from bright sun until established. Maintain a day temperature of 70deg to 75deg, 85deg to 90deg from sun heat, and a night temperature of 70deg, falling to 65deg or even 60deg in the early morning. The plants thus attended to will fruit in late autumn, but they must not be cropped too much if they are to give a plentiful supply from Christmas to the spring.

**PEACH HOUSES.**—Too luxuriant trees should be checked by making a trench one-third the distance from the stem that the trees cover in extent of trellis, cutting quite down to the drainage. Care must be taken that the trees do not suffer for want of water whilst the trench is open. This proceeding should be followed by a good watering. Root-pruning and lifting must be deferred until the leaves give indications of falling, but these operations are best performed as soon as the wood is sufficiently matured, and whilst the leaves, or some of them, are upon the trees.

**LATE HOUSES.**—The dull and wet weather has not been favourable to the late varieties, but they promise to be of large size, and, with fine summer weather, will be strikingly beautiful and excellent in quality. The trees must still have sufficient water, though a somewhat drier condition at the roots is desirable when the fruit is ripening than when it is swelling, but if kept too dry the fruit is mealy. A free circulation of air is necessary, utilising the sun heat as the fruit is backward, and with ventilation early in the day the temperature may run up to 85deg or 90deg, which is preferable to fire heat at a later period. Keep the wood thin, stop any growing shoots at about fifteen inches, or to such length as is likely to become matured, and whilst the leaves, or some of them, are upon the trees.—ST. ALBANS.

### Trade Notes.

#### Dicksons, Chester.

Among the bulb catalogues worthy of special notice at this time we would commend that of the firm named in our headline. This catalogue is under number 574, which avoids confusion with others that have gone before. It is well illustrated with good views of growing bulbous flowers, and also individual blooms of choice sorts. The descriptive letterpress conveys an impression of the characters of the numerous subjects. All genera of any decorative merit are included, and cultural remarks are not wanting. It is thus a useful guide as well as reference book on bulbs and their treatment. On page 31 Messrs. Dickson have compiled a separate detailed index of Narcissi.

#### Barr's General Bulb Catalogue.

Recently we referred to Messrs. Barr's Daffodil catalogue, which is separate from the autumn bulb catalogue. We would specially draw attention to their list of novelties and specialities for 1903, on pages 5—8 of the general bulb catalogue. Good practical notes on culture are given on page 1 of the general bulb catalogue and on pages 3—5 of the Daffodil catalogue. We notice that these catalogues are arranged on a strictly alphabetical system for easy reference. Amongst the new things we would name the yellow Freesia, Liliun elegans Peter Barr, Irises bucharica, persica Heldreichi, Warleyensis, Sofarana magnifica (all seemingly vigorous growers), Muscari Heavenly Blue (a gem), and Lycoris radiata alba.

# THE BEE-KEEPER.

## Beeswax.

This is familiar in every household. Its composition is generally considered to be 80.20 per cent. carbon, 13.14 hydrogen, and 6.36 oxygen, and its specific gravity 0.969. Beeswax is the result of a chemical process in the body of the bee, which requires certain conditions. A temperature of 85deg to 90deg is necessary for its secretion. Much honey is consumed during its elaboration, and to obtain the requisite temperature the insects cluster, the wax exuding on what are termed the wax pockets, which may be seen by pressing the abdomen of the worker bee so as to cause its distention.

On these ventral plates there will be found scales of wax forming in different stages. The bee seizes these little pieces of wax with one of its hind legs, and carries them to its mouth, and after masticating them for a moment they are formed into the cell walls of the combs they are building. A temperature of 85deg to 90deg is necessary for working the wax, as it only becomes plastic at 85deg. Beeswax forms a considerable article of commerce, large quantities of it being imported into this country when it is used for various purposes—furniture and boot creams, phonograph records, and it is used largely by dentists for making impressions of the gums preparatory to fixing false teeth.

Pure beeswax is bright yellow in colour, and has an agreeable balsamic odour not unlike some kinds of honey. Vegetable wax is not soluble with ether, while beeswax is partially soluble. Beeswax adulterated with 50 per cent. of vegetable wax would be detected by ether. A simple test of purity is to chew a fragment, which if pure will not clog on the teeth.

The bee-keeper should preserve all scraps of comb and extract the wax when convenient. When extracting, it should not be overlooked that the wax must not be subjected to oven heat, as it makes it hard and brittle. A good, simple method where a wax extractor is not possessed is to partly fill a large pan with water, and after putting the wax into a muslin bag and tying it, place it in the pan and let it boil over a medium fire until the wax rises to the surface; then remove from the fire and allow it to cool and settle. When cold, the refuse will all be at the bottom, and what little remains adhering to the under portion of the cake of wax should be removed, after which, if it is thought necessary, it may have another boiling in clean water, which will refine it still more. By the use of the wax-extractor all old combs can be utilised, and the wax made up into foundation and again given to the bees for the reception of honey.

For sale and exhibition, however, wax should always be extracted in a double vessel similar to a glue pot. The combs are broken up and placed in the vessel with sufficient water to cover them, and heated until the wax rises quite clean and of the best quality. For show purposes the cappings of honey cells should be used, as they are made of wax only. Brood cappings have pollen added to make them porous, therefore the inferior cappings of combs should be rejected. Wax should always be rendered in rain water, which, besides other advantages, will increase the yield of wax considerably. If hard water is used an acid should be added to unite with the lime in the water, and prevent it from attacking the cerotic acid of the wax. The acid generally used is hydrochloric, or nitric, of which a teaspoonful is sufficient for half a gallon of water. It is also essential that the combs should be thoroughly soaked in water before rendering the wax.

After refining, the wax should, if for sale, be moulded presentably. The moulds, to prevent the adhesion of wax, should be slightly oiled or rubbed with glycerine. Dipping in cold water will answer the same purpose. Some of the finest wax should then be poured into the moulds and made to run all round it to form a shell. This must be allowed to cool, and then more added, afterwards pouring in the bulk. The object of this is to have the indifferent wax or any sediment in the centre of the cake, and the outside perfect. The cooling process has also to be carried out carefully, or the cakes are liable to crack. The moulds should be placed near the fire and covered up to permit the wax to cool gradually. During the melting the wax should not be subjected to a higher temperature than its melting point, i.e., 145deg to 150deg.—E. E., Sandbach.

## Marketing Honey.

Many of our bee-keeping friends have now some honey for sale, and are naturally very desirous of disposing of it at once. But this is one of the greatest mistakes that a beginner makes. Do not be in too great a hurry; learn to wait, and you will probably reap your reward. In the first place the yield of English honey will not, in all probability, be heavy, so prices will be comparatively high, and those who are in such haste oftener than not sell at a sacrifice. Endeavour to create a private connection; sell at a reasonable price, and always provide a good

article. Many years ago I learned this lesson from a most successful fruit salesman in one of our largest markets. In the course of conversation we spoke of the qualities of British and American Apples, and he said: "Whenever I open a barrel of American Apples, whatever sample is at the top, I can rely on finding the same at the bottom; but I regret to say that British packed Apples are oftener than not topped with the best, and they decrease in quality as I near the bottom." Let us learn a lesson from this, and I am sure your friends will never desert you, and your customers will increase, but perhaps slowly.

**SELECTION.**—Remember it is a food, and all of us like to see that which we have to eat clean and attractive in appearance. The best cooked dinner badly or untidily served is never enjoyed nor appreciated. On removing sections from the hive grade them, placing all of one quality and finish together, and the highest grade will command a higher price. Scrape the wood well, removing all propolis, and a white border of wood will set off the well finished section and make it look appetising. If the honey has to be sent a distance use spring crates, or disaster will certainly follow. A home made one may be easily contrived out of an orange or egg box by the aid of a few springs purchased of the upholsterer. If the honey be extracted, strain it well through a piece of cheese cloth. Be certain it is quite ripe, and run it into clear glass bottles or jars, with neat labels bearing your name and the guarantee that it is "pure British honey," and not imported glucose, which has done so much to lower the price of the British production.

**PRICE.**—I was reading a standard work on the price of honey, and the writer says the price for section honey varies from 1s. 4d. to 1s. 8d., and extracted from 10d. to 1s. This is very wide of the price that any friend of mine ever realises. Last year I disposed of about 260lb at 9d. per lb, and I was very well pleased, for it worked out at a profit of nearly £9 when all had been paid for. By endeavouring to obtain a fancy price you lose in the long run. An acquaintance of mine would not sell any honey at less than 1s. per lb or section, with the result that he barely cleared expenses; and by selling at 9d., and placing it within the reach of a greater number, he would have secured a handsome profit.—HYBLA.

## TO CORRESPONDENTS

\* \* All correspondence relating to editorial matters should be directed to "THE EDITOR," 12, MITRE COURT CHAMBERS, FLEET STREET, LONDON, E.C. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense. In naming plants we only undertake to name species, or well-marked varieties, and only six on any one occasion.

**TENNIS COURT (G. R.).**—The ground for a tennis court should be level, smooth, firm, and well drained. For how to mark off a court, see our issue for April 2, this year, where there is also given an illustration, sizes, &c.

**CINERARIAS DYING OFF (P. K.).**—The Cinerarias are not infested by any disease, but are killed at the roots and root-stem level with the soil, and is probably due to watering them with Little's soluble phenyle in too powerful solution. In no other way can we account for the death of the plants, the roots being certainly destroyed, and we did not find the eelworm and Radish grub you allude to as being present, though you do not attribute the collapse of the Cinerarias to them. We think the evil is in giving the plants "too much of a good thing," the soil also being wet and sour; and the plants also seem to have been badly potted.

**CHRYSANTHEMUM LEAVES BROWNEED AND WITHERED (X. Y. Z.).**—The leaves have the appearance of attack by Chrysanthemum leaf blight (*Cylindrosporium Chrysanthemi*), but we did not find the fungus, though the blotches have the yellow marking at the circumference of the browned parts that indicate the presence of the mycelium in the tissues of the leaf. This appearance, however, obtains when the leaf tissues are destroyed by wet lodging on them for a considerable time, as has been the case during the recent and continued rainy weather, and we should attribute the browning to that cause. Possibly dusting with black sulphur (*sulphur vivum*) would have a good effect. The Orchid is an *Odontoglossum*, but we do not recognise the particular variety. Consult an Orchid specialist in your locality, as it is impossible to name varieties without comparison.

**PHOTOGRAPH RECEIVED (J. Udale).**—Received with thanks, and will let you know soon.

**INARCHING MUSCAT OF ALEXANDRIA UPON GROS COLMAN GRAPE (D. C.).**—So far as we have judged, the inarching will have no effect on the flavour of either Grape, or only the faintest. But what is your object? That, you do not state.

**MARECHAL NIEL ROSE (E. J. W.).**—This beautiful Noisette Rose strikes freely, and grows well from cuttings, many preferring it on its own roots. The author of "The Book of the Rose" (which book you should possess), however, says it does much better budded on the Briar than on its own roots, and he is authoritative.

**CUTTING OFF TOP OF TULIP TREE (F. L.).**—This splendid tree, far too uncommonly met with in pleasure grounds, is rather impatient of heading down, not breaking freely, and sometimes not at all, from the old wood. We, however, have no experience of pollarding a large tree. The most we have seen was the reduction of the head considerably to balance it, in consequence of a limb being broken off, and this left a considerable number of small branches with buds, which is different from leaving only bare wood. Perhaps some of our correspondents may have experience on this particular point, and will favour with its expression.

**BLACK CURRANT SHOOT (W. W.).**—Yes, the shoots are infested in the buds with the Black Currant bud mite (*Phytoptus ribis*). As the scales of the buds are more or less open, due to the growth of erineum or hairs caused by the mites, spraying the bushes with paraffin oil emulsion solution would have a good effect, diluting the emulsion with ten times its volume of water. The emulsion is readily made by dissolving one quart of soft soap in two quarts of boiling soft water, and on removing from the fire, and while still boiling hot, adding one pint of paraffin oil, and immediately churning the mixture with a small hand syringe, then, in five minutes, a perfect emulsion will be obtained. This diluted ten times with hot soft water, and well mixed, may be sprayed on at a temperature of 135deg to 140deg, thoroughly treating the bushes. When they are leafless, the bushes may again be sprayed with the paraffin oil emulsion solution at a strength of one part emulsion to seven parts water, the treatment being thorough.

**SKELETONISING LEAVES (J. J. G.).**—1. Steep the leaves in rain water in an open vessel exposed to the sun and air. Water must occasionally be added to compensate for evaporation. The leaves will soon putrefy, and their membranes will begin to open. When they have reached this stage lay them on a clean, white plate, filled with fresh water, and with gentle touches take off the external membranes, separating them cautiously near the middle rib. When there is an opening towards the latter the whole membrane separates easily. The process requires a great deal of patience, as ample time must be given, sometimes three months or longer, for the vegetable tissue to separate. When perfectly cleared from the cuticle, &c., bleach the leaves in a solution of chloride of lime, made by adding a tablespoonful to half a gallon of water; the operation of bleaching may be expedited by adding half a tablespoonful of vinegar to the solution. When the leaves are taken out of the bleaching liquid put them into clean water for a short time, and then carefully dry them, either between blotting paper before the fire or in the sun, after which they may be pressed flat in books. 2. A more expeditious method is to take a tablespoonful of chloride of lime mixed with one quart of spring water. In this the leaves should be soaked for about four hours, then taken out and well washed in a basin filled with water, after which they should be left to dry, with free exposure to light and air. Some of the larger leaves, or such as have strong midribs and veins, will require to be left for rather more than four hours in the liquid.

**NAMES OF PLANTS.**—Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number. (C. C. M.).—We think the Rose is Maiden's Blush, but we have had no opportunity to compare it with a growing specimen. (A Lady Reader).—*Tamarix gallica*. (J. B.).—*Rubus roseifolius* var. (F. N.).—1, *Juglans regia*; 2, the yellow form of the False Acacia; 3, *Genista aetnensis*. (F. L.).—1, *Solanum nigrum*; 2, *Montbretia crocosmaeflora*. (J. T. V.).—*Bredia hirsuta* (see Gadding and Gathering this week).

## The Master's Eye.

A farmer of a past generation being asked what manure he applied to his land replied, "Shoe leather," meaning that the wearing of boots in tramping to and fro o'er his fields was considered by him to be essential to successful farming. The principle which was in the mind of that farmer is essential to the successful conduct of every class of business, for it means, in plain words, close personal supervision of details.

No doubt there are capable foremen who can take this close drudgery work off the master's hands; but such men are difficult to find, and even the best of them cannot put the same personal interest into his work as the master can. In the case of foremen of average calibre, it too often happens that they have axes of their own to grind, and a labourer who is not too particular about doing a few odd jobs for the foreman *out of work hours*, may be allowed a very easy time *in them*.

We sometimes hear people lament the disappearance of the gentleman farmer, by whom they mean the man who shot and hunted, and left the serious work of farming to the hands of his bailiff or foreman. That such men are now comparatively scarce there is no doubt; but are they farmers? We emphatically answer—No. A farmer, as we opine, is one who makes business, not pleasure, the first consideration, and attends closely to it. We have good reason for believing that large profits cannot be expected from the pursuit of agriculture, and that farming for amusement should only be taken up by those who have well-lined pockets. Therefore we need not further emphasise the statement that those who take up farming seriously must prosecute it fully in every detail. To succeed, a farmer should absolutely be master, and he cannot be so if he leaves everything to a foreman, which he must do unless he is prepared to see all his orders carried out personally.

On large mixed farms there are generally at least three responsible men—the foreman, the shepherd, and the cowman or yardman. Each has his own department. The foreman superintends the cultivation of the land; the shepherd is responsible for the welfare of the sheep, as the yardman is for the cattle and pigs. If the master personally superintends these men, everything works harmoniously: there is only one master, and he is supreme. But if the stockmen are ruled through the foreman, there arises a dual responsibility with unsatisfactory results. What is anybody's business is nobody's business, and much time is spent in wrangling instead of getting work done. However large the farm, there is the greatest need for the farmer to see the work done; and with the bicycle to aid the horse, and his own legs, it is a poor excuse for him to say that he cannot see to everything.

A personal friend of ours who is very active on his bike declares that he has saved at least £100 per annum in manual labour since he began to farm on it. He is practically his own foreman, although he pays a man to act in that capacity. He does a good share of the shepherd's work on that same bike, and thereby is able to employ that shepherd profitably elsewhere. Such a procedure, if carried out by the foreman, would be instantly resented by the shepherd as an interference with his work and result in endless bickering.

It is astonishing to see the difference in the working energy of the men employed by such a master and those employed by one who gallops into the fields about 9.30 and is away again before he has had time to see who is there. The latter's men know where the hounds meet and that they will be free from supervision for the remainder of the day. Another man we know makes a point of seeing every man at work at least once a day, and greatly varies the times of

his visits. As one of his men observed, "We always have to keep at it, for Jimmy always comes when we don't expect him. Farmers should always pay their men's wages personally; for it is a bad plan to delegate this duty to a foreman, as it exalts the importance of the latter at the expense of the master. If the farmer sees his men at work every day and pays them himself, he should be able to avoid any undue leakage of hard cash as regards the wages account; and it is the wages bill which is the most serious item of the farmer's expenditure.

The master's presence is most necessary on threshing days. It is always advisable to keep a strict look-out to see that good corn is not diverted to uses which its owner would not intend it for. It is also necessary to watch the threshing process, to see that on the one hand the grain is all separated from the straw, and on the other that it is not bruised and broken by too much threshing.

The selling of the corn should also be a personal duty of the farmer. He should see to having his samples properly dressed by the winnowing machine, blower or screen, and that the bulk of grain has been so thoroughly mixed together that he can deliver it all alike and equal to sample. Personal and careful attention to these matters soon meet with appreciation on the part of millers and maltsters, who will bid above the market's limit of price rather than miss that which they know will prove satisfactory.

Exactly the same principle applies to the sale of fat stock. The auction system has taken deep root in this country, but it is entirely owing to the laziness of the farmers of the last generation. It is much easier to send cattle and sheep to an auction than to stand with them for hours in the open market. Many farmers nowadays do not trouble even to attend the auctions, but accept with a growl what the auctioneer sends them by next post.

Gates require close attention by the master. They should always swing freely, and as soon as there is the least necessity they should be rehung. With the shepherd's assistance (which the active farmer will always be able to control) and a bag of tools, he will be able to keep all gates in good order without any expense except for nails, screws, or an occasional new head or ledge.

## Work on the Home Farm.

We ought to be hard at work with reaping, but the corn is no sooner dry after one shower than the clouds roll up again and everything is wet once more. As in the opinion of some of the old hands we are rather inclined to cut the crops in too green a state, perhaps the hindrances may be for our good. Self-binders are working very well when the straw is sufficiently dry, and, given dry weather, they will cut almost anything. The crops have stood the weather well and are no more storm-broken than they were a week ago.

The broken time has been partially filled by getting in a supply of steam coal which should have arrived before. The men have been trimming hedges and cleaning roadside ditches of the grass and rubbish which grows up and chokes them. A neighbour, having no straw, is using this material from the ditches to make standings for his corn stacks. He is a Potato grower. Another has Wheat straw to sell, but declines to accept 24s. per ton. He is not a Potato grower.

There are sinister rumours as regards the well, or rather ill, doing of lambs. Personally we have nothing to complain of, but there is a great demand for our friend the "vet" with his preventive and curative drenches. Those farmers who have nothing to fall back upon but unripe Turnips as alternatives, to flushed pasture, will soon be in sore plight unless the weather changes materially. There is everything favourable to attacks of thread-worms (*strongylus*) in the windpipe. If the lambs are troubled with a tiresome and persistent cough, more especially at night, it is generally owing to the presence of this parasite. We have found turpentine and linseed oil the best antidote, but it requires careful administration. Each dose should be mixed separately, and to dose a large number of lambs it is well to employ three persons. Three small, narrow-necked bottles, holding two ounces, should be provided, into one of which one person should place a teaspoonful, and no more, of turpentine, another person should fill up the bottle with linseed oil, which should be well shaken and then handed to the third person to administer. This should be done with care and slowly, to avoid pouring any of the fluid down the windpipe into the lungs.

The land is so wet and the nights anything but warm, so young calves which have been lying out in the pastures would be safer in the shelter of a shed during the night. Prevention is better than cure.

AWARD OF MERIT R.H.S.

Late mid-season; very large and heavy; average width 3 1/2 in., height 4 in., weight 10-11 oz. Apex depressed; lobe unequal; suture shallow. Skin of a beautiful rich creamy colour, daintily flushed with crimson. Fine melting flesh which separates freely from the stone; rich brisk flavour, and very juicy. Of the Seedling Peaches raised by the late Mr. R. D. Blackmore this is the one he selected for distribution to his fellow fruit-growers. It has already proved itself of great value to follow the earlier and smaller varieties under glass. As soon as it becomes known it will be indispensable to market-men on account of its size, high quality, and its crimson and cream coloured skin, which is very distinct, and produces a goodly appearance.

Large trained Trees, with well-ripened fruiting wood, 31/6. Maidens, 21/-. Direct only from—

THURSDAY, SEPTEMBER 10, 1903.

**Classification of Narcissi.**

THE first and main object of all classification is to simplify the study of objects of interest in an orderly way, and to facilitate their recognition. With the botanical classification of the Daffodil or Narcissus we have nothing to do here, since the arrangement made by Mr. J. G. Baker in the

"Gardeners' Chronicle" of 1869 is still the best to employ in diagnosing the true or wild species. The first attempt to define pseudo-Narcissi from true Narcissi for garden purposes was made by Parkinson in his classical "Paradisus in Sole, or the Garden of Pleasant Flowers," originally published in 1629, or, say, thirteen years after the death of William Shakespeare, whom Parkinson long survived.

That a few additions to Mr. Baker's system are now considered needful is mainly due to the enormous strides made in the hybridisation and cross breeding of these beautiful Spring flowers by modern cultivators, and especially by the Rev. G. H. Engleheart, to whose industry and forethought nearly all the very finest and best of modern seedlings, and at least two of the distinct new sections, are due.

The two new sections at present to be provided for, as not coming under Mr. Baker's or Mr. Peter Barr's classifications, are, firstly, the Johnstonei group, or the hybrid offspring of N. pseudo-Narcissus and N. triandrus; and, secondly, the flat, or disc-crowned section, which Mr. P. R. Barr and myself propose should be called Englehearti, after their raiser, Mr. Engleheart.

In justice to the Narcissus Committee of the Royal Horticultural Society it ought to be stated here that when Mr. P. R. Barr and myself brought our proposed system of classifying Garden Daffodils before them at the Drill Hall meeting of April 14th, 1902, they, as

READERS are requested to send notices of Gardening Appointments or Notes of Horticultural Interest, intimations of Meetings, Queries, and all Articles for Publication, officially to "THE EDITOR," at 12, Mitre Court Chambers, Fleet Street, London, E.C., and to no other person and to no other address.

a body, utterly disagreed with it, scouted it, in fact as unworkable; and so far have merely acted as critics, without having suggested or, as a learned and corporate body of experts, produced anything better or more practical themselves. Neither Mr. P. R. Barr nor myself desired their adoption of our plan; we were, and still are, open to any new light on an intricate and complicated question.

At the exhibition of the Midland Daffodil Society, held at Birmingham two days later, April 16, the subject was again opened by Mr. Barr and myself at the dinner, on the eve of a long and busy day, when the classification here reprinted, with one or two alterations since made, was read by Mr. Barr, who, on concluding, said that the question was still in an evolutionary stage, but that he hoped before another season it might be brought nearer to some practical solution. It ought to be stated here, that before the subjoined skeleton plan of classifying Garden Narcissus had been read by Mr. Barr, Professor W. Hillhouse read a proposed system of his own, which contained many excellent points, but as it was really *de novo*, and ignored even the backbone of the system in use since 1869, to which growers, exhibitors, and others have become accustomed, it was felt that it could never be adopted in its entirety, although containing many excellent suggestions for a remodelling of an elastic and workable scheme. Professor Hillhouse's suggested system is published in this number, so that all interested may realise its importance for themselves.

It now followed that the speakers at Birmingham were really criticising two schemes or proposals instead of one, and, as usual under such circumstances and late at night after a good dinner, neither of the suggestions had justice done to them. In a word, I may paraphrase an old saying, "The way of those who propose the classification of the Narcissus is hard."

Mr. Engleheart said that all they could hope for was to pledge the producers of both schemes not to rush them through until they had a more favourable opportunity of discussing them. He, with more time to do so, felt that he should criticise both proposals, and he thought that they would have to mix up both, and run them into a much more simple form, before they would be of much practical use.

The Rev. S. E. Bourne followed, and said that there must certainly be some alteration in the old classification, but that care must be exercised lest they made confusion still worse than before. Mr. Bourne pointed out that Daffodils were now being grown in America, Australia, and New Zealand, and that it would not do for them to adopt a totally new system when all growers had become so used to the old one. He considered that a practical system was possible and workable, and that apparent difficulties must be boldly faced and overcome, and he considered that what Mr. Barr had proposed would form the foundation of a good and workable scheme. Mr. Engleheart observed that a working scheme or system was not impossible, but that, so far, the present schemes were, he thought, unworkable.

PROBATIONARY CLASSIFICATION OF GARDEN NARCISSI, AS SUGGESTED BY MR. P. R. BARR AND MR. F. W. BURBIDGE AT THE BIRMINGHAM DAFFODIL EXHIBITION AND MEETING, 1903.

N.B.—Species are printed in small heavy type, hybrid and garden varieties are shown in smaller type.

All doubts and disputes to be settled by actual measurement.

Group I. **MAGNI CORONATI, TRUMPET DAFFODILS.**

*Distinguishing character:*—Tube of flower as broad as it is long (except in the case of *Johnstoni*), and the crown or trumpet more than three-quarters as long or longer than the perianth segments.

- A.  **AJAX OR TRUE TRUMPET DAFFODILS.**—(Ajax of Salisbury, Haworth and Herbert; **Pseudo-Narcessi**, of Parkinson).
  - (1) Yellow Selfs. *Example*—N. Maximus.
  - (2) Bicolors, with white perianth and yellow or primrose trumpet. *Example*—N. Horsfieldii.
  - (3) Silvery white and sulphur-white Selfs. *Example*—N. Cernuus.
  - (4) Doubles. *Example*—Telamoniuss Plenus.
- B.  **JOHNSTONI** (hybrids of Ajax x *Triandrus*); tube of flower much longer than it is wide. *Example*—N. Queen of Spain.
- C.  **BACKHOUSEI** (hybrids of Ajax x *Tazetta*, the seed parent being yellow or Bicolor Ajax). *Example*—N. William Wilks.
- D.  **TRIDYMUS** (hybrids of Ajax x *Tazetta*, the latter being the seed-bearing parent). *Example*—N. S. A. De Graaff.
- E.  **HUMEI.** *Example*—N. Hume's Giant.
- F.  **CORBULARIA** (syn. *Bulboeodium*), the Hoop Petticoat or Medusa's Trumpet Daffodils, Self yellow, citron or white. *Example*—N. *Corbularia* Conspicua.
- G.  **CYCLAMINEUS**, a species with abruptly reflexed perianth and remarkably shortened tube.

Group II. **MEDIO CORONATI, CHALICE CUPS or STAR NARCISSI.** Mostly hybrids, but including the two species **Triandrus** and **Juncifolius**.

- A.  **INCOMPARABILIS** (Ajax x *Poeticus*).  
*Distinguishing character:*—Depth of cup more than one-third to three-quarters the length of the perianth segments.  
*Example*—N. *Cynosure*.
- B.  **BARRII.**  
*Distinguishing character:*—Depth of cup one-quarter to one-third the length of perianth segments.  
*Example*—N. *Barrii* Conspicuous.
- C.  **LEEDSII**, comprising the white and sulphur cupped *Incomparabilis* and *Barrii* forms with pure white segments. *Example*—N. *Minnie Hume*.
- D.  **ENGLEHEARTII**, comprising the varieties with flattened disc-like crowns, which by measurement come under Group II.  
*Examples*—N. *Egret*, N. *Astrardente*, &c.
- E.  **MACLEAI AND NELSONI** (hybrids of Ajax x *Tazetta* or Ajax Bicolor x *Poeticus*).
- F.  **BERNARDI** (hybrids of *Abcissus* and *Variiformis* x *Poeticus* and intermediate between N. *Incomparabilis* and N. *Nelsoni*).
- G.  **ODORUS** (hybrids of Ajax x *Jonquilla*). *Example*—N. *Olorus* *Rugulosus*.
- H.  **Triandrus**, a species with abruptly reflexed perianth. *Example*—N. *Triandrus* *Albus* (Angel's Tears).
- I.  **Juncifolius**, a rush-leaved species with widened crown.

Group III. **PARVI CORONATI.** Short and small-crowned Narcissi.

*Distinguishing character:*—Depth of cup less than one quarter the length of perianth segments.

- A.  **POETICUS OR TRUE POET'S DAFFODILS.** *Example*—N. *Poeticus* *Ornatus*.
- B.  **BURBIDGEI**, hybrids of N. *Incomparabilis*, *Barrii*, and *Leedsii* x N. *Poeticus*. *Examples*—N. *John Bain* and *Falstaff*.
- C.  **TAZETTA**, bunch or cluster-flowered Self yellows, bicolors, whites, and doubles; also N. *Schizanthus orientalis*.
- D.  **HYBRIDS**, *Tenuior*, *Gracilis*, *Intermedius*, *Biflorus*.
- E.  **Species**—*Dubius*, *Serotinus*, *Elegans*, *Viridiflorus*, *Pachybolbos*, *Canariensis*, *Broussonetti*, &c.
- F.  **Jonquilla** (a species), rush-leaved, golden-flowered, very fragrant.

As I have already said, there are two distinct new sections, viz., *Johnstonei* and *Engleheartii*, to be provided for, and this has been done by Mr. P. R. Barr and myself in our scheme, which retains all the old divisions as proposed by Mr. Baker, in 1869, and Mr. Peter Barr, in 1884, after the first Narcissus Conference of the Royal Horticultural Society. Our plan is also elastic, and may be made to include new sections when modern raisers of seedling Narcissus succeed in creating them. By publishing the two plans (as proposed at Birmingham) in the *Journal of Horticulture* an opportunity will be afforded to a wide circle of Daffodil specialists and breeders to note their objections; but it is desirable that in criticising our scheme something better should be proposed in place of whatever may be objected to, and in this way something really workable and trustworthy will be gained worthy of general approval.

As Professor Hillhouse pertinently observed at Birmingham, a natural or genealogical classification for garden seedlings is impossible, "hence classification must be essentially artificial, and determined by convenience and elasticity." Mr. Barr and myself had already and quite independently arrived at the same conclusion, hence the suggestion that actual measurements should be relied upon in all cases of doubt or indecision at public exhibitions of these flowers.

I am deeply indebted to the very excellent fifth annual report of the Midland Daffodil Society for its careful reprint of the proceedings as to classification and the discussion at Birmingham in April, 1903.—F. W. BURBIDGE, M.A., V.M.H.

For the accompanying illustrations our thanks are due to Messrs. Barr & Sons, London.

PROFESSOR HILLHOUSE'S PROVISIONAL SCHEME FOR CLASSIFYING GARDEN NARCISSI. PROPOSED AND READ AT BIRMINGHAM MIDLAND DAFFODIL SOCIETY'S SHOW, APRIL 16TH, 1903.

Professor Hillhouse introduced a paper for discussion on the classification of the genus *Narcissus* for horticultural purposes. In the course of a very learned and technical paper, he dealt with the general character of the genus, its habitat and geographical range, and referring particularly to it as a polymorphic genus, with very numerous natural hybrids, and like *Rosa*, *Rubus*, and other genera, not yet settled down by evolution, i.e., is probably in a developmental state. Hence classification must be essentially artificial, and determined by convenience and elasticity. There were, he said, two fundamental types of flower, (a) the large corona, six stamens of equal length, arising from near the base of the tube; and (b) the small corona, six

Daffodil, or Trumpet Narcissus.  
I.—MAGNI-CORONATI, section of Baker.

stamens of unequal length, three arising from nearer the top of the tube than the others. Then there was an intermediate type of flower, perhaps partly natural (that was to say its sources were very remote) as for example: Triandrus, Jonquilla, but probably mainly recent hybrids between (a) and (b), e.g., *N. incomparabilis*. There were two types of leaf, flat and rush, also with an intermediate type. Natural garden hybrids also very common, for the earlier growers did not artificially hybridise (cp Parkinson's list and figures, 17th cent.). Referring to Baker's Classification in three groups, the Professor said the general lines were still adapted for use, but perhaps it was

—Bicolors, or nearly selfs (to include *Bernardi*, *Leedsii*, *montanus*, *Mac'eii*, and *Nelsoni*—the former perhaps only a dwarf form of the latter—and *Tridymus*). B3. *Flore Pleno*.

C. *Parvi-corona*—Saucer-crowned Daffodils. The natural species of horticultural value included in this group are *N. Jonquilla*, *Poeticus*, and *Tazetta*. C1. *Burbidgea*. C2. *Engleheartea* (including varieties of *Poeticus*). C3. *Jonquilla* (to include *gracilis* and *tenuior*). C4. *Polyanthus* (to include *biflorus*, *schizanthus*, and *Tazetta*).

He suggested that if the disposition were towards a more revolutionary treatment of the genus, and the relative lengths of tube

Hybrid Chalice Cups, or Star Narcissus.  
II.—MEDIO-CORONATI, section of Baker.

a pity that he did not standardise the comparative lengths of tube and corona, instead of perianth and corona. The internal subdivision of these groups was now too complex and inelastic. With intercrossing and recrossing every gradation of form was, or might be found, and form could not be defined in sufficiently rigid terms; as for example, how to exactly state the difference between *Incomparabilis* and *Barrii*? In his attempt at rearrangement, a few new names had been introduced. Amongst Daffodil enthusiasts, six names stood out pre-eminent—Backhouse, Herbert, Leeds in the past, Barr, Burbidge and Engleheart in the present. Those six names he had utilised, associating each, as far as practicable, with an appropriate group, and to avoid confusion where the name had been used before, he had given it a new ending. The Professor then stated his scheme of Classification as under: A. *Magni-corona*—Trumpet crowned Daffodils (*Corbularia*, *Ajax*, and *Ganymedes* of Baker, and of Pax). A1. *Corbularia*—*N. Bulbocodium* and its vars. A2. *Backhousea*—All yellow selfs, or nearly selfs (to include *Humei* and *Backhousei*, both generally included in *Medii-coronata*). A3. *Herbertea*—Bicolor, or white, or nearly white, selfs. A4. *Triandrea*—(to include *Cernuus*, *Johnstoni*, *Cyclamineus*, &c.) with reflexed perianth segments, probably all hybrids of *N. triandrus*, and having its character. A5. *Flore Pleno*.

N. Johnstoni Queen of Spain.

Poet's Narcissus, or Small Crown Narcissus. III.—PARVI-CORONATI, section of Baker.

B. *Medii-corona*—Chalice-crowned Daffodils. With the exception of *Odorus* and *Juncifolius*, all the varieties in this group are probably hybrids, and as such I count also *N. Incomparabilis* of Baker's Classification. B1. *Barrii*—All yellow selfs, or nearly selfs (to include most *Barrii*, *incomparabilis*, *N. Juncifolius* and *Odorus*). B2. *Leedsia*

and corona were taken as a basis, the groups could be formed thus:—

1. *Magni-corona* (or *Brevituba*) with corona one and a half or more times the length of the tube; i.e.,  $\frac{\text{corona}}{\text{tube}} = 1\frac{1}{2}$  or more.

Tube broadening from the base or near the base.

2. *Medii-corona* (or *Medii-tuba*) all between the other lengths.

Tube cylindrical below, broadening above.

3. *Parvi-corona* (or *Longituba*), with tube twice, or more times, the length of the corona; i.e.,  $\frac{\text{tube}}{\text{corona}} = 2$  or more.

#### A New Winter Fruit Supply.

Despite the failure of the crop, we are to have an unusual quantity of dainty fruit offered this winter, and "Lloyd's" is able to announce a new departure in the trade, which will put an hitherto unattainable supply on the market. Some 50,000 or 60,000 cases of assorted Peaches, Plums, Pears, Apricots, and Asparagus will be sent to England from the Argentine Republic, commencing to arrive at Covent Garden in January, and continuing to do so through the remaining

winter months. The fruit is grown in the Tigre district of Argentina, the centre of the Peach market. At the junction of the Tigre River with another stream suitable land is purchased for the erection of store-houses, where fruit will be placed ready for export.

Arrangements have been made with the Buenos Ayres and Rosario Railway for the carriage of the fruit to the capital, where it will be transferred to the steamers for Southampton, and railway sidings are run right along the sheds. Contracts have been entered into with the Royal Mail Steam Packet Company for the erection of cold storage chambers on their boats and the conveyance of fruit therein to England.

An example of the Englehearti section.

Spray of Double Tulips.

## Forcing Home-grown Daffodils.

When there exists a large quantity of roots in the garden and shrubbery borders, a feeling may pardonably arise that some of these would do greater service lifted and forwarded into earlier bloom, and thus afford a means of giving a greater touch of colour at some particular time in the conservatory or show-house. For cutting, it may be said these would serve to relieve the better class stock of purchased roots, and thus reserve these latter for pot-grown purposes. This they do most conveniently, but particularly is this true of late winter and early spring, before the outdoor stock supply the flower basket. What I have found in these home-grown roots is that they require more time between the lifting, potting, and the starting them into growth, unless, of course, they have been prepared by enforced ripeness and rest after the foliage has died down naturally, and they are lifted for the purpose.

Brought-on in batches at early forcing time, we have found those first introduced into heat to be somewhat stubborn and sulky, and are content to allow the later lots to outstrip them in time allowance. This cannot be other than disappointing, if it does not favour a loss in time. Naturally there is not the ripeness of the bulb which favours the Dutch grown; soil and climate would aid that desirable maturity, but for later use, and attempts to unduly force them abstained from, there is no reason why home-grown roots should not do good service.

True, it is not in every garden where they grow in that profusion and vigour to justify their disturbance for gentle forcing; but there are some cases, at any rate, where this is so, and afford so good an accessory to the annually purchased stock. The double *Narcissus Telamonius plenus* and *Spurius* are both free in growth and flower, and are easily forced. Ard Righ, Trumpet major, and poeticus ornatus, are others that adapt themselves to this practice.

In the rather stiff soil of our lawn borders the double Daffodils and some others grow with such freedom that in a few years a single root produces great clumps, which at flowering time give two to three dozen blooms of fine substance, colour, and size.

Some of these can be lifted and well spared, and providing that only a clump here and there are lifted and sufficient replaced in the same station for a future stock, the border display loses but little of its spring effects in floral grandeur. When required only for cutting purposes they may be more easily grown in boxes made in any convenient size, and from 2½ in to 3 in deep.

Those who cannot afford to purchase bulbs for naturalising can use these box-grown bulbs, though it cannot be said they are so successful as are imported roots.—W. S.

## Cooks.

*By the Man who serves the Kitchen.*

Though I ain't bin a riter for a very long time, Mr. Editer, I'm a reeder o' long standin', and in the whole coarse o' my hexperience I niver remember seein' a harticle in th' Jernel under the above headin'. Now, in diskussin' my literary hefforts with my old woman, she has made a great point o' me bein' oriernal, becos as she said to me: "Jim," said she, "a author as ain't oriernal is no class, and if your name is ter go down ter posterity along wi' that o' Shakespeare and Dickens you must strike a line o' yer own, or these 'ere gardeners, who has a mighty opinion o' their own ritin', ull swear your copyin' 'em."

"Right," says I, "and can yer account for nothin' ever appearin' in th' Jernel about cooks, considerin' as they has to do wi' th' vegetables as th' gardeners grow?"

I may say that afore she went in ter partnership along o' me th' missus was a cook, and I thought she could throw some light on th' question.

"Yes, Jim," she said, "theer's two very good reasons. Either Mr. Head Gardener doesn't like th' reedin' publick to know as he's on a level wi' the cook, or else he's afeerd o' sayin' summat as ull bring that lady down on 'im; but as long as I'm heer to defend you there's nothin' to fear; only remember that you say nothin' about me, or there'll be a shindy, I promise you. So now you can go on with yer subject."

Perhaps this explernation meets the case; but still it's a bit of a puzzel to me that while reems o' copy has bin turned out about vegetabels and gardeners as grows 'em, there's bin a strange silence over th' party wot prepares 'em for table. Yet cooks and gardeners is inseperabel. Wi'out cooks there'd be no gardeners, becos there'd be nobody to boil th' taters w'en th' gardeners 'ad grown 'em; and if there were neither cooks nor gardeners there'd be non' o' those delightful little rows wot does so much to releve the monotomy o' gentleman's places.

Now, bein' a kitchen garden man, I perfess to know a bit about cooks, and it's my proud boast that if theer's any chap on this bit of a mudbank (as th' Amerikans call our proud little island) wot knows 'ow to work 'em, that man's your humble servant. In my time I've 'ad the privileg o' servin' fat cooks, lean cooks, tall cooks, short cooks, old cooks, young cooks, teetotal cooks, and cooks as drank. I've bin brought inter contact wi' maiden cooks, and cooks as wos widders, cooks as perfessed to despise men, and cooks as would ha' fainted wi' delight if some chap had a hofferred to a married 'em. I served a man cook for a bit once, but he were a Frenchman (Froggy, we called him), and had a bit of a temper. That wouldn't ha' mattered so much, but one mornin' he knocked th' butler down wi' a fryin' pan 'cos th' butler told him as Boney was licked at Waterloo afore Blucher came up, and in consequence o' this little devarshion he got a month's notis, th' butler bein' an old servant, and mighty particular about givin' a drop o' beer away, which wos considered to be a fine trait in his karacter by th' missus, who wos a great adverkate o' temperance.

Now, th' cook as comes nearest to perfeckshon, accordin' to my way o' thinkin', is a fat 'un; the fatter th' better, becos the superflews amount o' flesh (or fat) she carries pervents her from worryin' either herself or anybody else. A fat cook is rarely 'ard on a chap. If you happen to be a few minits late wi' th' vegetabels in a mornin' she measures

your pace by 'er own, and makes allowances, and th' only time w'en she wants a bit o' workin' is in th' summer time, when th' jam makin' is in full swing; and I put all that down to th' heat and sweat.

I'm allus a bit suspishous about a cook as is extra haffable, for you may depend she's got summat in view. We had a head gardener once who was a bachelor, and in th' kitchen at the same time there was a cook as wanted a 'ome. Lor, the messages that woman used to send out by me, summat like this: "Complements to Mister S—, and many thanks for th' Mushrooms he sent in this mornin', which was lovely." I didn't see through it for a bit, but I got suspishous when she took ta runnin' up th' garden herself for little sprigs of Parsley, and in the end she got her 'ome in th' gardener's cottage.

There's nothin' on earth so changeable as cooks, and w'en they don't stop in a place more than three months they causes no end o' trouble. Fust there comes one as wants all big vegetables, big Onions, big Tatars, and so on, and I does my best to please her. Well, she leaves, and there comes another who wants little vegetables; and arter I've bin to no end o' trouble in growin' a 2lb Onion, I find it in th' pig tub, arter it's bin kicked all over th' kitchen and done one little jerney in th' direction o' my head. It's very 'ard, this sort o' thing is, but it's only one o' th' troubles that falls to the lot of a man who follows the honered perfession of a kitchen server. Once we

had a cook as was a mark on Spinach; and after we'd planted about half th' garden with it, she left, and another came as wouldn't look at Spinach. So it went to th' pigs, and in due coarse th' 'ousehold had some Spinach fed bacon. So yer go on, one cook wantin' one thing, and another wantin' summat else. It don't seem to matter much wot th' missus wants, for th' cook gets her own way in th' end, and if th' head gardener wants any peece o' mind th' best thing he can do is to humour her.

Mind you, I've no intenshon o' bein' 'ard on cooks in general, cos I've served some good 'uns; and bein' a man o' some corporation myself, it's whispered in th' pottin' shed that th' distance round my waist is due in a meshure to the little odds and ends wot 'as bin dropped inter my empty vegetable baskets from time to time; but, as Kiplin' 'ud say, that's another story.

The relashions between cooks and head gardeners is very strange. When the latter is out among his friends he talks about what th' master likes and wot th' missus is pleased with, and he leaves th' cook out o' th' question; but when he's at 'ome he's continually botherin' me about takin' in just wot she wants, and is partikally anxious w'en I go in fer orders in th' mornin' to know the state o' the old woman's temper, though he never appears to trouble much about her 'ealth.

Still, it's a sublime thing to see a cook and a gardener on friendly, not to say lovable terms wi' each other. It gives you a soort of a insight inter that glorious time as is promised us when th' lion and th' lamb will lie down together, and th' soard will be turned inter a reapin' hook (though I don't see wot good it ull be, considerin' as reapin' macheens is all the go now). I say that any gardener as can live for a year in a place wi'out once offendin' the cook ought to be moved from his spheer and be put inter th' Cabinet, for his deplomasy is lost in a garden, and ort to be employed in th' welfare of his country. With a fat cook to deal with such a thing is possible, but not probable; but wi' a thin cook or a widder such a state of affairs is too much to expect.

Wo be also to the poor kitchen serving man when cook and gardener are at daggers drawn. His lot is wus than that of a felon, 'cos th' gardener blames 'im w'en th' cook grumbles, and th' cook says things to 'im about th' gardener which he dursn't repeat, afeerd o' losin' his place; so he is like Mr. Pickwick, a soort of a shuttlecock; but instead o' two lawyers bein' the battledoors, they are a cook and a gardener. I've bin so hard pushed at times in this respect that I've sighed for sum geenus to invent a hortomatik cook as

you could wind up in a mornin' and leeve her to run on silently till night; but she ain't forthcomin' yet.

I've only one more word to add, Mr. Editer (so keep your blue pencil in yer pocket), which is this. They tell me as th' lady gardener is comin' along, and it's only a question o' time when all th' establishments in th' country will be kontroll'd by female head gardeners. It's also said that th' cooks o' th' future will not be ordinary cooks, but lady cooks; and though I'm 'opin' as this state of affairs won't be real till I've 'anded in my checks, if it does cum about in my time I shall retire from my present sitiuation, and vote for female kitchen garden men (that sounds Irish, but you know wot I mean) and lady kitchen servers.

**NARCISSUS, SULPHUR PHŒNIX.**—Either in grass, in borders, or in pots, the double Daffodils are seen to great advantage; and Sulphur Phœnix, otherwise "Codlins-and-Cream" (*N. incomparabilis plenus* var.) is one of the best. Messrs. Webb's block shows its effect used in a vase.

**A SPRAY OF DOUBLE TULIPS.**—The Tulips are amongst the flowers that seem lovelier in the double than the single state, others being the Chrysanthemum, the Carnation, and the Rose. But double Tulips are far too little enjoyed, while singles are found everywhere. They like a warm border and porous soil. The illustration from Messrs. Sutton will serve to emphasise our note.

Narcissus, Sulphur Phœnix.

#### Chrysanthemums at Earlswood.

During a visit to London the last Saturday in August, I could not resist the temptation to journey and see what Mr. Wells had in the way of 'Mums at Earlswood. I found him at home, and his greeting was characteristic: "Well, what have you come to see? Big 'Mums?" I said, "Yes," and he replied, "Well, we have none here." The key to the mystery was that the plants are at the new nurseries he has acquired at Merstham, which formerly belonged to Mr. Ross.

After a cup of tea, a friendly dogcart soon landed us at the new place, which is situated halfway between Redhill and Merstham. It is an ideal spot for Chrysanthemum growing; open and well situated, comprising in all  $4\frac{3}{4}$  acres, with plenty of glass. The chief houses are: one 126ft by 36 $\frac{1}{2}$ ft, another 150ft by 20ft, a third 107ft by 17ft, and two 100ft by 20ft, besides several smaller houses. There are about 2,000 plants grown for big blooms standing on concrete lines, 7in wide and 4ft apart.

Amongst many fine plants the following were particularly striking: Salter's Favourite, a new one of Mr. Pockett's strain, with the most distinct foliage I ever saw. The leaves are almost as round as the leaves of a Brussels Sprout. The colour of the bloom is said to be rosy cerise. J. H. Doyle, named after the winner of the Melbourne Gold Medal, April, 1903; Mrs. H. A. Allen, another Australian with a big reputation; Mrs. J. Wells, a new crimson; and many more new varieties under letter and number.

Of the varieties in commerce of recent introduction I found Donald McLeod, F. A. Cobbold, Leila Filkins, Maynell, Mrs. F. W. Vallis, S. T. Wright, W. Duckham, F. S. Vallis, Pantia Ralli (uncurved), Silsbury's Terra Cotta, and Yellow Nellie Pockett, all most promising.

Mr. Wells cultivates early flowering varieties largely, and has something like 24,000 plants growing in the open ground, many of which were in bloom, amongst them being Horace Martin, a grand yellow; Roi des Blancs, a long-petalled white; Gertie, a beautiful bright yellow; Kitty, a bright rose; and Madame Marie Massé and its various sports were making a brave show. Goacher's Crimson is also very fine and free flowering. La Parisienne, a quite new, creamy white; Champ de Neige, another new white; The Champion, a new yellow of Mr. Goacher's raising, not yet in circulation, but most fitly named. Mytchett Pink seems a good pink variety; and Charlie is a fine creamy sort.

I was very much struck with a new method Mr. Wells has adopted for raising stock plants. He has six plants of a variety placed out in boxes about 3ft by 2ft by 6in deep, which can be lifted under cover later on, and should ensure good healthy cuttings. I came away very pleased with my visit, and am sure all his many friends will wish Mr. Wells success in his enterprise.—A. H.

## Gadding and Gathering.

#### Henry Eckford's Nursery at Wem.

It was on the eve of the recent Shrewsbury Show that four of us hied out to Wem from the Salopian capital. Favoured with sunshine after showers, the visit was of the most pleasant nature, and the ten acres of Sweet Peas and culinary varieties, were still fruitful of beauty and interest. Here we were in the home-centre of the English Sweet Pea, the place from which Henry Eckford sent his earliest cross-breeds, from Bronze Knight onwards, with which he commanded the attention of the floricultural world, and has never yet been outstripped in his own line of flower breeding.

On every side, Peas—the odorous *Lathyrus* in a hundred colours, and many heights, but all generous in their gift of blossoms, and sweet in every instance. Mr. Henry Eckford does not now labour amongst his favourites, for the burden of eighty years begins to tell upon him, yet how hale and hearty does he appear! And he can tell stories of other and far back days with the keenest zest, and laugh joyfully at the tales of "the boys." Long may he continue to!

From among the acres of Sweet Peas, one, a new one, stood out most tellingly by its splendid form and colour. This was Scarlet Gem, of which there is a goodly stock, and this variety received a first-class certificate from the N.S.P.S. in the summer. Truly it is one of the finest sent out during the last dozen years. Other newer varieties already known, however, and which comprised Gracie Greenwood, Jeanie Gordon, Lord Rosebery, and Mrs. W. P. Wright, were in fine condition even thus late. Dry weather was much wanted for seed harvesting.

Along the edges of the herbaceous plant borders the beautiful cup-like flowers of the white Evening Primrose (*Oenothera speciosa*) were in great profusion, and furnished a neat as well as choice edging.

Occupying fully half an acre of ground by themselves were the Pansies and Violas in a host of named varieties, the strain being of high merit, with plenty of good flowers and a fine habit of growth.

The culinary Peas and the Beans, both of which are largely cultivated, the Peas amounting to acres, were ripening their pods, so that comparisons of varieties could not then be made.

J. V. & Sons, Ltd.

#### Fritillaria meleagris.

The variety Record was, however, worthy of special attention, carrying as it does ten peas in the pods, large in size, and rich, marrow flavour. Prior is one of the parents. Memorial, The Bruce, The Gladstone, Dwarf Monarch (a heavy cropper, with large, well-filled pods), and one named Royalty, with very even, straight pods, each well filled, and plenty of them—these were a few noted in a quiet walk through the main portion. The Tomato houses afforded views of heavy crops, and in every department of the nursery the stock looked well.

Mr. John S. Eckford, the only son of the founder of the business, and who now manages it, will ensure its continued lead in the Sweet Pea line by reason of his calibre and care.—WANDERING WILLIE.

**FRITILLARIAS.**—A considerable difference exists betwixt the Crown Imperial of stately mien and the "Chequered Daffodil" which we figure on this page, and which luxuriates so uncommonly well in the meadows near Oxford. The *Fritillaria Meleagris*, or Snake's Head Lily, flowers in April and May; and anybody visiting Kew during that time will see how effectively it appears beneath the early flowering shrubs, or mixed with Primroses and vernal Irises. Nor is it hidden, lost, or useless in long grass with Daffodils, for there the perfect beauty of the flowers are seen at their best, as nearly all bulbous flowers are. The rose-mauve of the pendant blossoms are half buried in the green ensuathing, and one sometimes has to wonder what the pinky heads are, just peeping beneath the Daffodils. But they are of divers shades, some pale tea, others purplish or faded magenta and prettily chequered, and all are worthy of culture. The illustration is kindly lent by Messrs. J. Veitch and Sons, Limited.

### Lime, Sulphur, and Softsoap Wash for Gooseberries.

If this note reaches the eye of the writer of a letter which recently appeared in the *Journal of Horticulture* or some other paper, recommending a wash of lime, sulphur, and softsoap on Gooseberry bushes, to prevent birds from destroying the buds, a brief repetition of the recipe will greatly oblige.—FRUIT GROWER.

### Inarching Vines.

"D. C." writes further in reference to inarching varieties of Grapes, that his object "is simply to extend the Muscat of Alexandria by inarching them on Gros Colman, which do not thrive under the treatment for Muscats." Continuing: "To save time, I tried the inarching; but someone told me it was doubtful if Muscats would succeed on Gros Colman stocks. If that is so, my little transaction is abortive."

### Shrivelling of Muscats.

If my theory is correct, shrivelling will be more than usually prevalent this season. It arises from a lack of solid material in the berries, and more especially in the early stages of their growth. The want of sunshine this season will considerably aggravate the evil. It is not at all too early now to begin taking precautions to prevent the same thing occurring next year.

I will presume that the borders have been fed with all that is desirable for them. If not, they must not now have anything in the shape of nitrogenous feeding till the fruit is cut. Potash and superphosphate would not be likely to do any harm, and nitrates, which are quicker in action, can be added later, so long as there is healthy foliage remaining. Every effort should be made to keep the foliage healthy, especially the older portion of it near the base of the stems where the buds are situated for fruiting next year.

There are still some people who keep up high night temperatures, and this in my opinion is one of the great causes of shrivelling. Muscats do not want it any more than other Grapes. If they are required early, start them early, for you cannot make up lost time by roasting them. The beginning of February is not too early to close the house if you want Muscats coloured in August. In order to secure the greatest possible amount of root action in proportion to the top, one should proceed very gently till the flowers open, which will be about the middle of April, and even then there is no need for high temperatures, 55deg minimum is quite high enough. I have nothing to say against high sun temperatures with ample ventilation at this stage, and when there is no sun, fire heat should be used sufficiently to dry the pollen by the middle of the day.

Now, if you would prevent shrivelling, and secure early colouring, the bunches must be exposed to the light as soon as they are formed. In the first place the rods should not be less than 4ft apart, the side branches should not be less than 1ft apart, and 18in would be better. Any branches which have the fruit removed from them might be lowered somewhat by tying them to stakes inserted in the border or other ways which suggest themselves, and sometimes the bearing branches can be raised by putting a tack in a rafter and slinging them up. Treated thus the berries will never assume that very dark green we often see when they are grown in the shade.

Of course there is some risk of scalding when the fruit is thus exposed, but this can be reduced to a minimum by keeping the temperature down to 80deg during the latter portion of the stoning period. A little shade may be necessary for about a fortnight at this stage, but this season none at all was wanted. When the second shrivelling commences a higher sun temperature is very beneficial.

As the Grapes shown by me at Bath were favourably commented on by your reporter, and many questions were asked as to how Muscats could be coloured in such a season, I state here as much as I can think of wherein my treatment is likely to differ from that of other growers. My Muscats were below 50deg more than once when flowering, not for a want of heating power, but it was difficult to regulate it in a small house, 27ft by 15ft, with a powerful boiler, and I had rather have it at 50deg at night than 70deg. That a high temperature was not employed

at any time is proved by the fact that Madresfield Court, coloured jet black to the footstalk, was shown from the same house at the same time.—WM. TAYLOR, Bath.

### Floral Arrangements.

The note on this subject on page 214, together with the illustration in another column, will, I trust, tempt some of our exhibitors to forward notes upon the arrangement of bouquets in their several forms. I have no doubt information would also be acceptable to many ancient sprays and buttonholes. One cannot help remarking in this connection that no amount of information nor practice will avail in making some persons expert in the art of bouquet making; but nearly everyone can greatly improve upon first efforts if care and attention only be given, added to observance of the best specimens of the work of some of our leading exhibitors.

Generally speaking there has been an advancement in the direction of greater looseness and freedom in the building of bouquets. At one period I thought the shower arrangement in danger of developing into a faggot of ribbons and blossoms, but there appears to have been latterly a sensible check to mere "largeness." The old practitioner felt compelled to have his stick for the centre of his bunch of flowers, with moss or wadding to pad them in position, with these and wire constructing a semi-globular head more or less stiff. Matters are better nowadays, it is true, but even in the illustration mentioned above, which at first sight appears light and graceful enough, there seems on closer scrutiny a tendency to central "massing."

It may be my fastidious fancy, but to me a bouquet of flowers appeals best as a mere handful of blossoms, each as choice as possible of its kind arranged without jostling its neighbour, with (and here we have a matter for the exercise of some judgment) just a sufficient dressing of foliage and no more. Wires we shall never be able wholly to dispense with, as scarcely any flowers can be made to stand in the required position without support; besides, when wired, each can be manipulated by the operator with greater ease.—DECORATOR.

### The Fruit Crop in Ireland.

Our occasional correspondent, Mr. W. J. Murphy, Clonmel, has sent the subjoined note to the Dublin "Freeman's Journal," 2nd inst.:—

"I read your sub-leader referring to Mr. Morgan's views on fruit culture and modern methods to ensure success in this day's 'Freeman,' and as I take much interest therein, I ask your permission to draw attention to this year's deficient supply, and to ask the cause thereof. I have carefully read Mr. Morgan's articles in the Limerick 'Munster News,' and can find no elucidation of the abnormal state of the outdoor fruit crop this year. I have a walled-in town garden fairly stocked with Apples, Pears, Plums, Cherries, Peaches, Apricots, and Nectarines on south wall. The crops, especially of Apples, have been uniformly good for the past eight years; the trees are young dwarfs, and have been regularly pruned and carefully washed with the garden hose, while the soil is of that calcareous formation that suits Apples specially. Yet the crop this year is only a fraction of all former years—practically no Plums or Pears. Mr. Morgan might urge that if the trees were grown in the open, and in loamy soil, with a good aspect, success would be more certain. Well, I cannot agree with that. The hon. secretary of the Kilkenny Agricultural Society has an orchard of several acres, just such a soil and aspect, and for which he obtained a special prize—the varieties being of the choicest—and this year the result is no better than mine. I have just been through the Cork district as far as Clonakilty, and to find the same result general—no fruit this year. It would be very important if you invited expert opinion as to why there has been a general failure of the fruit crop this year. From what I have said you will see it is not soil, location, varieties, nor want of proper treatment. I have thought over the matter myself, and without pretending I can elucidate the result, I think the unsatisfactory state of things is greatly owing to the absence of sunshine, and the consequent imperfect ripening of the wood. If this be so, next year's crop will be no better.—W. J. MURPHY, Clonmel."

## Ancient and Modern Daffodils.\*

When Daffodils came into fashion in 1884, the subject of a popular name was much debated. Narcissus is the botanical name for the entire family. Daffodil, strictly speaking, applies only to the trumpet section. Some individuals spoke of them as Daffodils, while others named them Narcissi, and frequently the same speaker would use both terms. Others, again, would refer to the trumpet section and its hybrids as Daffodils, and to the poeticus section as Narcissi. A "sort of" compromise was arrived at so as to avoid confusion, and now all sections of the Narcissus are generally called Daffodils.

The earliest recorded reference to Daffodils was by Theophrastus, of Eresus, about B.C. 300. Homer and Sophocles both wrote of the Daffodil. The former, in his hymn to Demeter, speaks of the Daffodil thus: "The noble Narcissus wondrous glittering, a noble sight for all, whether immortal gods or mortal men, from whose root a hundred heads spring forth, and at the fragrant odour all the broad heavens above, and all the earth laughed and the salt waves of the sea." In 1888 during some excavations in the cemetery at Hawara, in Egypt, some floral wreaths were found, one of which consisted of the Bunch-flowered Daffodil, and is supposed to have been made by a Greek artist resident in Egypt about the first century before the Christian era.

There is some doubt as to the species of Daffodil referred to by the early Greek and Roman poets in their writings, but it is generally accepted to be poeticus, or what we now call the Poet's Daffodil. There can be no doubt as to the flower referred to by Homer in his hymn to Demeter. The Bunch-flowered Daffodil alone would give the hundred heads and the fragrance named.

Shakespeare's "Daffodil that comes before the swallow dares, and takes the winds of March with beauty," is the Daffodown-dilly or Lent-lily of English copses and meadows. In 1597 it is said there were twenty-four species of Daffodils cultivated in London gardens. In 1629 John Parkinson published his "Paradisus Terrestris in Sole; or A Garden of Beautiful Flowers." At that time there appear to have been many Daffodil amateurs, as he states there was much confusion amongst the names, and so undertook the task of setting the family in order. Those who may have access to this old book will find many quaint remarks and criticisms on the names of Daffodils.

Parkinson records nearly one hundred sorts, but since the advent of Linnæus, many so-called Daffodils of pre-Linnæan times have been put into other families. From Parkinson's day to the early part of the nineteenth century it may be said little or no progress was made in Daffodil lore. There were, however, many gardening books published between 1629 and 1800, but none of them added to Parkinson's list. Hales, it is true, gave a woodcut of one he called "Silver and Gold," which we now recognise as *N. scoticus plenus*. Some curious theories were, however, propounded on the making of double Daffodils, all of which may be safely called nonsense.

Double Daffodils, as far as I can make out, originated in a wild state, but when, and where, and how, are unsolved questions. No one in modern times has added a double Daffodil to the existing ancient forms; indeed, I am not quite sure that we know as many double Daffodils as Parkinson cultivated in his garden in Holborn, London. Some names of double Daffodils have been changed, it is true. But a change of name does not make a new flower. Let us examine what is known of some of the double Daffodils in a wild state.

The big double yellow Daffodil (*Telamonius plenus*), of Haworth, is found in Italy, with its single varieties *Telamonius*, now called King Umberto, and Princeps. This latter is one of the most common and free flowering, and in the spring the flower-boys of Melbourne, Australia, sell it by the million in the streets. These three have been gathered wild for me in the valley of the Arno, Italy. Of the Daffodil of Shakespeare, its double form grows on the Isle of Wight plentifully, and sparsely in many other parts of England. The double form of the Scotch Daffodil has been found in Holland, along with its single form. A double Daffodil is found growing along with the Tenby Daffodil in Denbighshire. The Gardenia-flowered double poeticus comes from the wild English poeticus. The double "Butter and Eggs" grows with its single form in the Landes, France. "Codlins and Cream" is a double form of semi-partitus. "Eggs and Bacon" I would suggest is a double form of Bernardi, a hybrid found on the mountains above Luchon, in the French Hautes Pyrenees.

There is a beautiful reversion from "Eggs and Bacon" now known as Mary Anderson. In my travels I found a double variety in Spain of *Pallidus præcox*. There is a double form of the small sweet-scented Jonquil. There are a few double forms of the Bunch-flowered Daffodil, and in China the double and single forms grow together of the "Good

Narcissus, Peter Barr.

*This is without doubt the finest white trumpet Daffodil yet raised. It is of distinct form, having a beautiful pure white shouldered perianth and a large handsome elegant trumpet almost pure white. The flower is large and bold, of beautiful symmetry and fine substance. It is a strong grower and free bloomer, with handsome deep bluish-green foliage. F.C.C. from the Royal Horticultural Society in 1902. We are indebted to Messrs. Barr and Sons (who own the stock) for the use of the illustration.*

\* Read at the meeting of the Sea Point Horticultural Society (Cape Colony), September, 1901, by Mr. Peter Barr, V.M.H.

Luck Lily" or "Joss Flower," which is a variety of the Bunch-flowered Daffodil section.

We have no record what prices were paid in Parkinson's day for Daffodils, but they could not be cheap, seeing that Frenchmen made a business trip annually to sell Daffodils in London, and some of these were collected on the Hautes Pyrenees. The beautiful small white trumpet Daffodil, *Moschatus*, grows on the spurs of Mount Perdu, a place difficult of access. On one of my Daffodil hunts I went to the place with six Spaniards and a Pyrenean guide, sleeping under the rocks at night and travelling and collecting by day, till our commissariat ran short, and we had to make a precipitate retreat. On our return journey we broke into a small cheese factory in the Val Derrass, and helped ourselves to the whey, leaving money to cover our consumption. On our outward journey we had helped ourselves to the whey, and the owner knew we must return in the same direction, so locked up his place to keep us honest.

#### Daffodil Experts.

In the first quarter of last century there arose an active band of semi-botanical amateurs, some of whose names are worthy of remembrance. Salisbury, a clever botanist, had a fine assortment of Daffodils, which he grew at St. John's Wood, London. Sweet, who gave us a botanical dictionary and an illustrated work in seven volumes, now much sought after for libraries, viz., "Sweet's British Flower Garden." Ellecomb, a missionary in the neighbourhood of Leicester Square; Anderson, superintendent of the Physic Gardens, Chelsea, where a complete collection of Daffodils was grown, and thither the experts met over their favourite flowers.

We can readily imagine the many discussions on the different species, and the best modes of culture. These meetings may be accepted as the first of the modern conferences on Daffodils, and I can imagine that many a spear was broken between Salisbury and Haworth, two tough antagonists. Haworth at the time was preparing a monograph of the family, and, like Parkinson, putting the nomenclature of the Daffodil in order. The monograph is quite a little pamphlet, showing that the herbariums of Europe had been ransacked and every illustrated book consulted. The work is now rare, but if "Sweet's British Flower Garden" is in your public library you will find the monograph bound up with one of the volumes. I possess the last revision made the year preceding Haworth's death. I should mention Haworth was a prolific writer on many natural history subjects, and I think he gave a monograph of the *Mesembryanthemums* of Cape Colony.

Dean Herbert, of Manchester, about this time was working on his *Amaryllideae*, and when dealing with the Daffodil family and analysing what were supposed by all his predecessors to be species, felt sure some of them were hybrids. To satisfy himself on this point, he crossed the trumpet with poeticus Daffodil, and the seedling was truly intermediate. The problem solved, he had his flowers painted, and the water-coloured painting is bound up with Herbert's monograph of the *Crocuses*. Visitors to London will be shown this on calling at the Lindley Library at the offices of the Royal Horticultural Society, Victoria Street, Westminster, or at Barr and Sons' warehouse, King Street, Covent Garden, these being the only two copies I know of.

Dean Herbert made his discovery known early in the forties, and I have no doubt it created great interest, and that many took up the study, but only two men carried their work to the goal, viz., Mr. William Backhouse, banker, Darlington, and Mr. Edward Leeds, stockbroker, Manchester. To these two seedling collections the world is indebted for the pleasure in spring of cultivating a family of the most charming flowers, and enjoying them in their drawing rooms, since 1884.

The work of these two men commenced in the forties and ended in the sixties, representing some twenty-five years' enjoyment unshared by the outside world. At that time the Daffodil was despised, and few people would tolerate it in their garden. I took up the study of the Daffodil early in the sixties, working on the older forms known to Parkinson. In the seventies I became the possessor of Leeds' seedlings, and then Backhouse's seedlings, and during the following ten years I found my hands each spring very full, and my leisure time fully occupied in cleaning, classifying, and naming the Daffodils raised by the men named, both of whom had joined the majority long before the public realised how much beauty there was in the flowers of their handiwork, and how exceedingly valuable these flowers were in filling up a gap in our floral display outdoors and indoors.

While the Daffodil is the hardiest of spring flowers, it also lends itself to culture under glass or in a sitting room window. I do not suppose that Oscar Wilde knew anything about Daffodils, but there is no doubt in my mind that the great public are much indebted to him for the revolution in taste caused by his lectures on æsthetic colours. He broke down the prejudice to yellow, the artists followed him, and the public followed the artists. About this time I had finished my work, and the collection represented about 500 distinct sorts, ancient and modern.

The Royal Horticultural Society held a great Daffodil Con-

ference in the spring of 1884. From that day the fame of the Daffodil was secured, and like magic spread over the British Isles, extending to all Britain's colonies.

Having set the machinery, so to speak, agoing, I claim a right to be proud of the result of my twenty years' labour; during this period it was all outgoing and no incoming. The amateur is only one element, however; I created a new industry. The street flower girls and hawkers of London do a profitable trade selling Daffodils for at least three months in the spring. The Scilly Islands yearly send hundreds of tons of Daffodil flowers.

### Mr. Peter Barr, V.M.H.

Peter Barr was born at Govan, Scotland—then a prosperous weaving village on the Clyde—in April, 1826, but more to his taste than looms or their products were the Tulip beds in his father's garden, and it was their beauty decided his fate. At an early age he was employed in the seed shop of Mr. Jas. Thyne, of Glasgow, eventually taking full charge of the seed department. His next appointment was with Messrs. Daly, Drysdale, and Co.,

Mr. Peter Barr.

seed merchants, of Newry, County Down, Ireland, when but twenty years of age, where he went through the terrible famine years of 1846-1847, caused by the general failure of the Potato crop. From Newry he went to Mr. Richard Smith's nursery at Worcester, then only sixteen acres in extent, and a year or two afterwards he was appointed manager to Messrs. Butler and McCulloch, of Covent Garden. After some years of experience in the London seed trade, Mr. Barr started as a seedsman in the autumn of 1861 under the style and title of Barr and Sugden. Two years later he commenced his labours on bulbs.

He has devoted much attention to hardy garden plants as well as seeds, beginning with the Daffodils and *Liliums*, and studying also other genera, such as the *Scillas*, *Hellebores*, *Funkias*, while more recently he has paid much attention to the beautiful genus *Pæonia* in all forms and variations, having travelled a good deal in Spain to collect the European species, some of which were known in herbariums, but unknown in cultivation. Mr. Barr has donated a collection of these European species to the Botanical Gardens of New York, Harvard, University of Pennsylvania, Schenley Park, Pittsburg, and other American institutions.

Mr. Barr's last work was on the old florist Tulips of historical fame. He got together the older collections of the Scotch, London, and Dutch to compare with the more modern of the midland counties and Lancashire, with the result that the modern men carried the day in form, chasteness of marking, and clearness of bottom.

A few years ago Mr. Barr resigned his business to his three sons and went on a tour abroad. At his home-coming a representative of this paper had a lengthy interview with the respected veteran florist, and the notes taken on that occasion are appearing in these pages, under the title "The Daffodil King on Tour," so that the main lines of his past six years are before our readers. Mr. Barr is hale and hearty, and may long be spared to study the various interests in his mind. He is at present in Scotland. The portrait of him was taken in 1896, when in Norway.

#### *Anomatheca cruenta.*

This pretty little Irid is a native of the Cape of Good Hope, whence it was introduced long ago: but up to the present time we were not aware that it had any claims to be considered a hardy plant. Captain Rogers tells us the plant has come up regularly for the last three years in his stable-yard, near the root of a Plum tree, and in a situation where it gets no benefit from the morning sun, and indeed only a scanty supply of sunlight for the rest of the day.

#### The Best Thirteen Violas.

I am often asked (writes Mr. Wm. Sydenham, of Tamworth) which are the best twelve or thirteen for bedding or exhibition. For bedding I have no hesitation in recommending the following thirteen. They were at the top of the Viola favourites during this season, 1903:—Councillor Waters, Accushla or Hector Macdonald, Molly Pope or Kitty Hay, Rolph, Skipjack, Duncan, Seagull or Swan, Blanche, John Quarton, Favourite, Golden Queen, White Beauty, and J. B. Riding.

#### *Catalpa bignonioides.*

Amongst many fine trees growing at Thornhill Park, Bitterne, near Southampton, there is one of the finest, if not the finest, specimen of the above-named species to be seen in this country. The stem at the base is 10ft in circumference. The tree, which is about 60ft in height, is now (August 20) well covered from the ground to the top with very large spikes of bloom, each individual Achimene-like flower measuring from 1½ in to 2 in across. Thornhill Park is not what is called a show place, but there is much there to interest the horticulturist, especially the grand collection of coniferous trees growing in the pleasure grounds, and anyone fond of woodland scenery, extensive views, and, just now, some splendid patches of heath quite dazzling to look at, could do much worse than pay a visit to the genial head gardener, Mr. George Busby.—C. S. F.

#### Species of Clematis.

The collection of species of Clematis at Kew is at present in good condition for studying. The lanuginosa varieties are in a bed by themselves, and include the favourite and best sorts. Each in a round bed by itself, and at suitable distances apart on the open green sward are the species, numbering about a score, some of which are not seen out of botanical gardens, even though they are beautifully decorative.

Thus there is the yellow flowered *C. orientalis tanguitica* (drooping like a *Fritillaria*); the dull, the metallic brown *C. fusca*; the charming crimson-flowered *C. coccinea*; the primrose bell-like *æthusifolia latisepta*, which bears hundreds of its drooping little blossoms from slender, twining branchlets. With these there are *C. campanulæflora*, with lovely white and mauve tinted flowers, quite like those of a small *Campanula*; also *C. viticella* in varieties white, violet, or purple, and furnishing one of the finest types of plants it is possible to find for covering pillars and pergolas with at this season. These are all of a climbing character.

Amongst others to be noticed are *C. orientalis* (type) with its light glaucous foliage and very slender, "sprayey" growth. *C. connata* is desirable for its foliage alone, which is a lively green, the leaves being imparipinnate, having five leaflets. The leafstems are opposite, clasping the stems.

The intermedia varieties may be compared to the better known *C. viticella*'s. They are profuse bloomers and effective en masse. *C. coccinea* from Texas, makes a better show against a sheltering wall, in a sunny border, than on a wooden support in the open. *C. vernalis*, which flowers early in the year, like *C. montana*, has foliage not unlike that of *Spiræa japonica*, though not serrated. It is a good climber. *C. montana*, by the way, and also the *C. vitalba* or Traveller's Joy, are splendid plants for forming bowers of. *C. flammula*, *integrifolia*, and *heracleifolia* are each interesting, the latter two being dwarf. *C. integrifolia* may frequently be found in herbaceous borders; while the *Heracleum*-leaved Clematis is a good "wild garden" plant.

#### Violas as Rock Plants.

When once tried as rock plants Violas will be much appreciated. They do well, produce an abundance of bloom, and generally thrive better than in any other part of the garden. Miniatures are particularly at home when grown in this position: Pigmy, Robin, Minnie Warren, Commodore Nutt, White Dot, Quail are a very interesting set.

#### Winter Aconites.

The Winter Aconite, or *Eranthis hyemalis*, is an excellent subject to carpet any wild border or shrubbery with yellow flowers, which appear in January. The tubers may be planted in autumn, from October onwards, placing them 2 in apart and 2 in deep in any ordinary soil. When planted they will come up annually, remaining a permanent feature, and flowering freely before the Snowdrop. The tubers are cheap, the best being obtainable at 2s. 6d. per 100. Tubers may also be planted in large pans for windows, verandahs, cool house, or sheltered positions.—S.

#### Bulbous Plants in Greenhouses.

It is a strange fact that large numbers of practical gardeners can cultivate plants to perfection, yet they have as much knowledge of, and taste for staging the same, as a dock labourer might be expected to have. It is a serious and great failing, but, unfortunately, columns of printed matter cannot supply a faculty that is wanting, the lines can only suggest what might be done. But where the power of imitation is good, an illustration like the one given (p. 243) can be of service. Grouplets and masses of one sort of plant are generally more beautiful, and more pleasing to the mind, than a studied mixture of subjects of all forms and hues. A house such as Mr. Chamberlain has at Highbury, which is span-roofed, with a door only at one end, is, when filled with sloping banks of all the various spring-flowering bulbous genera, arranged in bold harmonised masses, a sight of great resplendency and grandeur. We commend a display of this nature, as we also commend the arrangement of such a collection as the illustration shows.

#### Dog's-tooth Violets.

*Erythronium Dens-canis*, the Dog's-tooth Violet, is a hardy bulbous perennial, remarkable for having leaves beautifully marked with white and bronze. The flowers are of mixed colours. Dog's-tooth Violets are better adapted for outdoor treatment than indoor, and are admirable for growing on a rockery or a front position in an herbaceous border, as well as for edging beds filled with spring flowers. The compost best suiting them is sandy loam and leaf soil, intermixed with peat. The bulbs should be planted at once, 4 in deep and 2 in apart, in bold groups for rockeries and borders, and in lines for edging beds. They will also thrive under the shade of trees, hence their value for the wild garden, where they can remain as a permanent feature. Their value as pot plants is not very great, though they will succeed in a cold house. Pot the bulbs now an inch apart in 5 in pots, and place at once in cold frame, where they may remain until advanced in growth and showing flowers, which will be in February or March.—D.

#### *Lilium Harrisi.*

The Bermuda or Easter Lily, *Lilium Harrisi*, is largely used for forcing. Good, firm, healthy bulbs should be procured and potted now, so that they may have a long season of steady growth under cool conditions rather than attempting to force them along in heat after late potting. One bulb is sufficient for a 5 in or 6 in pot. The compost most suitable is simply three parts of good, fibrous loam, and one of leaf soil, with sand added. Drain the pots efficiently, and half fill with compost, on which place the bulb, covering with half an inch of soil. This will be ample until growth commences. The best place for the pots at first is a cold frame or cool house, and so long as the soil remains moist, no water will be required, but afford it as necessary after growth begins. On the shoot attaining 3 in in length, top-dress with a mixture of loam, leaf soil, and manure in equal parts, leaving room below the rim of the pot to supply water. Keep the plants near the light in order that the growth does not become drawn. Do not force them until necessary, then commencing gradually at 50deg, but not exceeding 65deg. The watering must not be neglected. The plants when in full growth will appreciate a little weak stimulant. When in bloom give cool treatment.—E. D. S.

#### Général Jacqueminot Variety.

At the recent Abbey Park Flower Show, Leicester, the age of Général Jacqueminot Rose was discussed. It was sent out in 1853, and at the present time, a half century later, it is still a very fine exhibition Rose, as well as being much grown for cutting and market purposes. In a review of the "Roses of 1854," which appears in the October number of the "Florist" for that year, the late Mr. Thomas Rivers remarked, in reference to this Rose: "Général Jacqueminot is one of our new Roses and most striking from the size of its flowers, which are of a rich shaded crimson. It has, however, two faults: its flowers are not sufficiently double, and its habit of growth is slender and delicate." And Mr. Rivers went on to deliver himself of a truism, that "We now require Roses perfect at all points; larger and

#### True Perfumery Rose.

When Mr. Fred M. Reed was travelling in Europe two or three years ago, he visited Grasse in the south of France, the centre of the manufacture of perfumes and essences from Rose and Orange blossoms. He was especially interested in the true perfumery plant growing in the adjacent country, but was not allowed to take either cuttings or roots, as that variety of plant as well as the secrets of manufacture, is guarded with jealous care. He secured some blossoms which he preserved.

After returning he made inquiry of botanists as to the French perfumery Rose in this country, but could learn of no plants. He then wrote to the botanical department at Washington. Mr. Galloway, then chief of the bureau of plant industry, replied that there was no sample of that variety in their collection, and as far as he knew, it had never been introduced into this country, as it was very hard to secure, but said he would make an effort to get a sample for him. Some weeks ago Mr. Reed received a letter—announcing that he had secured and was forwarding to Mr. Reed some of the perfumery Roses—from Mr. Peters, who has in charge the matter of introducing new plants into this country for the Agricultural Department.

The plants were received in good condition from their long journey. Mr. Reed gave samples to Prof. Zumbro and E. L.

Bulbous Plants in the Greenhouse (See page 242.)

double flowers, opening freely; fine, healthy foliage, and a vigorous, hardy habit."

Probably in such standard varieties as Alfred Colomb, Beauty of Waltham, Charles Lefebvre, Duke of Edinburgh, Dupuy Jamain, Marie Baumann, Mrs. J. Laing, Pride of Waltham, and Ulrich Brunner (not to mention some of the new Irish Roses), the ideal Rose of Mr. Rivers is nearly produced. But our ideal assumes proportions as we get near to it, and it is always possible to picture an ideal flower in advance of our choicest possessions.

How nearly has Général Jacqueminot approached Mr. Rivers' ideal? I turn to the description given of it in Messrs. Frank Cant and Co.'s Rose Catalogue, and I read of the dear old Général that it is "bright-scarlet crimson, globular, with pointed centre, perfect shape, a fine, free flowering Rose, still one of the best, and especially for forcing; vigorous habit." The Général improved on acquaintance, and largely remedied the two faults found with it by the veteran Rivers.

The moral to be drawn is that with the Roses, as with some other flowers, the experience of two or three years at least is necessary to form an authoritative opinion upon the positive merits of any particular plant or novelty. I think it is likely "General Jack" will yet be grown for some years to come.—R.D.

Koethen, and planted fifteen plants himself, all of which are growing nicely. But the variety has but one brief season of blooming—in May—so the interesting part will have to be waited for.

The foliage is a dull pale green. Mr. Reed says the blossom is quite like that of the old-fashioned Cabbage Rose. Mr. Peters, now in California on business for his department, called on Mr. Reed on Saturday, and was pleased to find the Rose plants he had secured all living and in vigorous condition. He said they had made much better progress than those planted in the department garden at Washington.

Mr. Peters is a very pleasant gentleman, enthusiastic in his special work, and doubtless is accomplishing what may prove of far-reaching benefit to California as well as to other parts of the country in introducing new varieties of plants. From here he goes to Imperial to study the conditions with reference to introducing the Date Palm for commercial purposes.

However successful these first perfumery Rose plants may prove, for various reasons it will probably be many years before the Rose perfumery industry will become commercially valuable in this country, but when it does some day, Riverside will have the satisfaction of having introduced the first plants.—(Riverside Press.)

## NOTES

## NOTICES

**New Varieties of Potatoes; Their Prices.**

Another new Potato of Mr. Findlay's, which has not yet been placed on the market, has recently been sold at 28s. per lb, Mr. George Massey, of Spalding, paying £20 for a stone of them. The variety (Eldorado) is a main crop, with good disease-resisting qualities, and those sold at this price (over £3,000 per ton) are part of a crop now growing in the North of Ireland.

**A Fence on Wheels.**

In large public gardens, the invention which the directorate of the Royal Gardens at Kew have adopted in order to preserve portions of the lawns and edgings from being trampled on and spoilt, should be of great service. This is simply a stout wire fencing, 2½ ft high, fixed by means of bottom supports, to run on wheels. Each length of fencing may be 8 ft. Thus arranged, the fence can be wheeled to wherever wanted.

**Fruit and Vegetable Show at Chiswick—Alteration in Schedule.**

The prizes offered in class 52 for Apple "Charles Ross" will be open to nurserymen and market growers, as well as to gardeners and amateurs (see Division V., page 24). Intending exhibitors at this show can obtain a copy of the schedule with the official entry form, on application to the Secretary, R.H.S., 117, Victoria Street, S.W. Entries for this show close on Tuesday, September 22. At a general meeting of the Royal Horticultural Society, held on Tuesday, September 1, twenty-two new Fellows were elected, making a total of 1,117 elected since the beginning of the present year.

**Royal Gardeners' Orphan Fund.**

Writing from a garden near Bath, a correspondent says:—"May I trouble you to forward the enclosed P.O., value 3s. 6d, to the Secretary of the Royal Gardeners' Orphan Fund, as I do not know his address? The gardens were open to the public on two Sundays, and it occurred to me that by placing a box on one of the gates, with a note stating the object for which money was solicited, I might get something to send for the benefit of the little ones left to the mercy of the charitable by past brethren of craft. My effort resulted in almost a total failure; but I hope to do better another time." [We have received the secretary's receipt for the 3s. 6d.—Ed.]

**Exhibition of Edible Fungi.**

On Tuesday, September 15, the Royal Horticultural Society will hold an Educational Exhibition of Edible Fungi in the Drill Hall, Buckingham Gate, Westminster, 1.5 p.m., and an illustrated lecture upon them will be given by Dr. M. C. Cooke, M.A., V.M.H., at three o'clock. All interested in extending or acquiring the knowledge of the edible species are invited to send collections. Collections should, if sent, be delivered at the Drill Hall on Monday afternoon, September 14; or, if brought, should arrive at, or before, 9 a.m. on the Tuesday, so that they may be properly grouped and arranged by the fungus specialists. Intimation of an intention to exhibit should, if possible, be sent a few days before to the Secretary, R.H.S. Office, 117, Victoria Street, Westminster, S.W.

**Croydon Gardeners' Outing.**

The fourth annual outing of the Croydon and District Horticultural Mutual Improvement Society took place on August 26, about thirty members availing themselves of the day's pleasure. Starting from the Sunflower Temperance Hotel, a most enjoyable drive in a char-a-banc took the party to Burford Lodge, where, through the kindness of Sir Trevor Lawrence, Bart., the party were shown round the gardens by Mr. Baines, the able head gardener. The visit proved full of interest and enjoyment. Afterwards the drive was continued to Dorking. In the afternoon, Albury Park, the residence of his Grace the Duke of Northumberland, was the rendezvous, and the spacious gardens and pleasure grounds here were inspected. Croydon was reached in good time at evening, each participant expressing his full appreciation of the trip, and congratulating his companions on the extremely fine weather experienced throughout the day.

**Warley Cottage Garden Show.**

The fifth exhibition of garden produce under the ægis of the Great and Little Warley Cottage Garden Show, was successfully held on September 3. Miss Wilmott, V.M.H., is president, and gave the prizes.

**Mr. Robert Sydenham.**

This gentleman has safely arrived at the Cape of Good Hope, and hopes to visit the principal towns in that part of Africa. He will be present at the National Chrysanthemum Society's Show at the Crystal Palace in November.

**Albanian Onions.**

The harvesting of the Onions will now begin in a week or two. If it is not too wet weather during the harvesting the Onions will be better in quality and more durable than last year. The size will again be generally large, and the quantity of the crop will be smaller than last year. This is not only because part of the fields were lost shortly after sowing, but also because a smaller quantity has been cultivated, owing to the low prices of last year.

**The Jam Season.**

As it is impossible to get fruit for jam-making this year, might I suggest to people who grow Vegetable Marrows the advisability of letting some ripen and selling them for jam-making? Such jam is very wholesome and good. I made some last year, one Marrow yielding 14½ lb after being prepared for jam. I hope to make twice as much this year. As they are still growing strong it is not too late to save them, but they must be quite ripe before cutting, and then be laid by for a month after that.—J. C.

**Tigridias.**

Tigridias, or Ferrarias, are very brilliant while they last in flower, but unfortunately the blooms only last one day in perfection. The bulbs should be planted on a dry, sunny border, preferably where the display can be seen from the windows, as the different coloured blooms, each thickly covered with spots, are exceedingly attractive while they last. The best time to plant the bulbs is April, 3 in deep and 5 in apart, placing a little sand around and under each bulb. Mulch and water freely in dry weather.—K.

**Naturalised Daffodils.**

The idea of planting large masses of Narcissi, Squills, Crocuses, Fritillaries, and Tulips in grass lands is comparatively new, but is annually spreading fast and becoming more and more developed. Here, as in other phases of gardening, mistakes can be made. It is not an uncommon sight to see a newly planted sheet of grass, with some hundreds of flowers, each standing far apart from its neighbour, and seeming none too comfortable. Thin planting is permissible, and even best, where the grass is rough and long, and the Daffodils are well set off; but where the ground is inclined to be bare here and there, or has a scanty herbage, the effect produced is far better, if close-set grouplets are made of the bulbs. And the varieties are also best when left unmixed. What a shame, for instance, to plant Ard Righ's amongst Horsefield's, or poeticus with Barri conspicuus or Frank Miles. Keep them by themselves. Messrs. Veitch, of Chelsea, have kindly placed the illustration on the opposing page, at our use, and it shows a good example of correct planting.

**Local Rating Appeal.**

Messrs. Walter T. Ware, Limited, florists, of Englishcombe, were assessed to the poor rate on an assumed annual value of £370 9s. Notice of appeal to the County Quarter Sessions was given. Before the hearing came on it was arranged that the matter should be referred to a jury, which, however, could not agree, but appointed Mr. John Alderson Foote, K.C., as umpire. Mr. Foote held several sittings and visited the property, and his award has just been published. Mr. Foote fixes by his award the rateable value of the property at £258 19s. per annum. He also awards that his fee of £94 14s., and also the costs of the reference be paid by the Union Assessment Committee. The case is of considerable importance to nurserymen and owners of horticultural buildings, because the umpire decided that the cost, or assumed cost of the buildings, could not be taken into consideration for rating purposes, but that the only question was what rent such buildings would fetch. Mr. Isaac Williams was the solicitor for the Union Assessment Committee, and Messrs. Stone, King, Stone and Thomas, represented Walter T. Ware, Limited.

## Bulbs and Their Culture.

At this season of the year the thoughts of all who are interested in gardening naturally turn to the consideration of bulb orders and bulb culture generally. The numerous species and varieties now play so important a part in adding brightness and beauty to our homes and gardens that it is really painful to imagine how dreary they would be without them.

Too long we have depended upon the Continent for our supply, with the result that huge sums of money have annually been drawn from this country to enrich the dwellers in other lands; because, forsooth, it was generally supposed that good bulbs could not be propagated and grown in our sea-girt home. A change for the better in this respect has, however, been gradually taking place during the last ten years, and now the finest samples of Daffodils, Tulips, and Hyacinths, grown in Britain, are equal in point of merit to those obtainable from any other source.

Lincolnshire and Ireland must each claim a large share of credit for this improved state of affairs, and it is to be hoped that bulb culture will still extend until Britain supplies the greater portion of her own requirements. In order to encourage the home trade, purchasers should remember the above facts, and endeavour to obtain the products of their own land.

It is always a wise plan to order early, as the best samples are disposed of first, and those who rely upon being able to pick up cheap lots at sales often find them to be dear; on account of their unsatisfactory results.

For early forcing the following can be strongly recommended: White Roman Hyacinth, Double Flesh-coloured Italian, Paper White Narcissus (*grandiflora*), and the Double Roman. Tulips: Duc Van Thol (scarlet), La Reine, Pottebakker (white, yellow, and scarlet), Rose Gris de Lin (rose and white), and Proserpine (salmon). Daffodils: Princeps and Van Sion. These should be grown in quantity where there is a great demand for cut flowers, and the Roman Hyacinths, early Narcissus, and Tulips may be had in flower from the beginning of November onwards, and the Daffodils at Christmas, to be followed by the choicer varieties with large trumpets. Where the above have not been already obtained they should be ordered at once, and potted or planted in boxes as soon as received.

In selecting bulbs one should never be led away by mere size, as the best samples are heavy in proportion to their size, and have a smooth clear skin instead of being rough and scaly on the outside (see illustration on page 257). The bulb contains the plant and flower in the embryo; and although it is not possible to add a single additional belt to a Hyacinth spike by subsequent treatment, yet good culture will do much towards securing the fullest possible development to the baby plant within the bulb; and, on the other hand, unsuitable treatment will prevent full development, and in some cases prevent flowering altogether, even when the finest samples of bulbs have been obtained. It is, there-

fore, a matter of the greatest importance that the soil used for potting, and the subsequent treatment, are both suitable. Some writers aver that it matters but little what soil is used for potting; but let me urge cultivators not to accept this theory as being generally correct, as I have seen far too many failures through following such advice. The great desideratum is not so much to use a rich soil as to get a rooting medium comparatively free from insects and fungoid spores. Soil which has been used for growing early crops of Tomatoes often answers well with the addition of a little leaf soil and sharp sand; but in some cases such a soil is so full of eelworms as to entirely prevent satisfactory root action.

Good garden soil which has been dried, turned a few times, and enriched with leaf soil and wood ashes, will often answer as well as anything. A friable turfy loam which has become mellow with age also answers splendidly with the addition of leaf soil and sand; but freshly cut turfy soil is not suitable, as roots do not work freely in it until the fibre has considerably decayed. When there is a doubt about the suitability of any soil, the safest course is to burn it, and it will then always be found satisfactory. When natural manures are added they should always be thoroughly dried and passed through a fine sieve; but I prefer steamed bonemeal at the rate of a 6in potful to a bushel of compost.

All pots should, of course, be well but not excessively drained, and when showy potfuls for decorative purposes are required, the bulbs may be arranged as closely as possible. When, however, extra fine individual flowers are required, a little more space must be allowed. In the case of Tulips and Roman Hyacinths six to a 6in pot answer well.

When very early forcing is carried out, it is not easy to get all the flowers in a pot to open simultaneously. The general practice, therefore, is to force in boxes and transfer to pots—or to other receptacles used for decorative purposes—when the flowers are almost fully developed.

In the case of bulbs grown for supplying cut flowers throughout the winter and early spring, boxes should be used in preference to pots on account of economy, the result being quite as good as under any other system. The

bulbs should be arranged in the boxes so as to touch each other, the crown of each being just visible upon the surface soil. A light sprinkling of sand on the top will allow the plunging material to come away easily when the pots or boxes are removed.

The great demand for cocoa-nut fibre has sent the price up so high during recent years that very few can afford to use it largely for plunging purposes, for which it is so splendidly adapted. A substitute is found in the shape of fine shavings and sawdust from hard woods, and now often used; and then we have that useful material coal ashes. This forms capital plunging material provided it has been exposed to the weather for some weeks, or, better still, months, to allow the deleterious properties to escape.

An excellent plan is to save such materials throughout the summer, and then pass them through a half-inch sieve before using for plunging purposes. Surround the pots or

Naturalised Daffodils.

J. V. & S. ms.

boxes containing bulbs with any of the above materials, finishing off with a 2in or 3in thickness on the top. Never remove the bulbs from their plunging material for the purpose of forcing them until at least an inch of growth has been made. —ONWARD.

## Quid pro Quo.

(Concluded from page 210.)

Hours and holidays, to save space, may run tandem with hours as the leader. Here the whole gardening staff, being directly affected, is included. To head gardeners personally the matter is less pertinent, they as a rule being first in the garden and last out of it. With the usual 6 a.m. to 6 p.m. arrangement, and meal times, according to local custom, there is probably but little to cavil at. The long days of summer, too, being counteracted by the short days of winter, with bad weather relaxing the tension of labour, are factors we must include in an honest calculation. The main object in approaching this phase of the question is a plea for the early "knock off" on Saturday.

In this masters would confer a boon on their men and under judicious management certainly lose nothing. If the garden worker is worthy of his hire, then, surely, he is worthy of this little encouragement, and in those parts of England where men with the cares of a family upon them, and often those without, may be seen cultivating their cottage gardens till noon on Sunday, the Saturday afternoon would, presumably, be devoted to it.

It is, however, less a question of how they would spend it than of obtaining it, and when that happens all right-minded men, old or young, in the bothy or out of it, would undoubtedly appreciate the boon to the extent of its giving an additional zest for their employer's work and interests. But few with a knowledge of all sorts and conditions of gardeners will hesitate in placing them on a par with factory operators or trade-workers, with whom the Saturday afternoon off has long since been a recognised institution.

The whole gardening Press advocates it, much has been said and is being said in its favour, but much, practically all, remains to be done. The wheeler in our tandem team is, perforce, the Bank holidays, and what has been said for the leader applies to it, beyond adding that when all the world and his wife are keeping lawful holiday, the gardener being left to toil and moil the common round, the daily task, invidious comparisons are drawn, and the inconsistency is glaringly apparent.

Perhaps the Act of Parliament which created Bank holidays might have gone farther, and insisted upon their observance. Perhaps not. However that may be, it is but poor encouragement to the loyal, honest, hard-working gardener of any degree to be ignored as one of a class unworthy of this privilege, and, apparently, speaks but little for the esteem or appreciation in which he is held by his master.

Think you that my lord, the Earl of — (I hope the time will come when his honoured name may be published), who but rarely sees one in particular of his country estates, is worse served, or is one iota out of pocket when, some two years since, on one of his rare visits to it, the order was spontaneously given that *all* his employes should have the Bank holidays? Ah, no! Like master, like man. It is such masters who create the best of feeling, obtain the best of service, and transform men from spiritless drudges into cheerful, active servants, for "no profit is where is no pleasure ta'en."

Ere prescribing a salve for the sore, no inference need be drawn that any disparagement of masters is implied, for none is intended. No two classes of men live in better or more intimate relationship than masters and their gardeners, possibly not any as good. The dilatoriness of progress in the betterment of gardeners must be attributed to old customs inherent and peculiar to gardening alone, old customs which appear to die harder here than elsewhere; the factors of supply and demand, in the excess of the former over the latter, which would be an inferior obstacle if a less elastic subject permitted a more rigorous selection of the fittest, and a want of cohesion in the gardening fraternity. There are, certainly, other weak links in the chain, but the above are the weakest, and upon viewing the matter analytically it is less a matter for surprise than it is one for

regret that the status of gardeners moves so slowly in the hurrying stream of life.

In adverting to the fact that some of the noblest, worthiest, and most philanthropic, and, it may be added, the most practical patrons of the art of gardening, have shown their sympathy towards its exponents in all ways alluded to here, and in other ways, for instance, in their generous support of the Gardeners' Royal Benevolent Institution, paves the way to promulgate the idea which has prompted this paper.

In a United Kingdom Gardeners' Association, which is not a very formidable name after all—in a great combine which shall bring all gardeners worthy of the name within its folds, we have—What? is asked. Is it labour against capital? Is it class against class? Men against masters? No! The Fates forbid. No such bogey need frighten the most timorous brother of the craft. We—the weak—shall take the masters—the strong—along with us, and, as players in this very serious game of life—a gardener's life—hold them as trump cards, even the King himself. In the treatment of his gardeners the King is a model master, and with his beloved Consort, the Queen of all hearts in these Islands (another trump card), a tower of strength from whose summit a kindly light may illumine the shady places of gardening England. With a strong executive, composed of those honoured masters who, in the treatment of their men, have "lured to brighter worlds and led the way," and with the most illustrious leaders in the gardening world, a foundation could, surely, be laid for a practical working scheme strong in its simplicity, with power to permeate the United Kingdom and leaven the lot.

The bulk of British gardeners can, of course, do little more than give their moral support to it, the little more being, possibly, a tax on their slender pockets to the tune of an annual shilling to cover working expenses and give them a claim to membership. It may reasonably be supposed that masters who have already recognised their gardeners with an adequate *quid pro quo*, in its comprehensive sense, are sufficiently interested and sympathetically disposed to lend their names and possibly assist an object with which they are in accord, and from which their more fortunately placed gardeners could not only scarcely hold aloof, but give it their warm and active support. Then, surely, it is not supposing too much in saying there should be but little difficulty in drawing out working plans on a scale sufficiently large to cover all the ground we have gone over.

The question of ways and means can, perforce, be but roughly outlined here and do little more than invite discussion on the subject to the end of future elaboration; not too far in the future, it is hoped. With a central executive and branches throughout the kingdom, publishing, possibly, a monthly journal, posting leaflets, or other literature embracing a mass of facts, evidence and examples, and setting forth the chief fact that this conjoint betterment of the gardener, in the way of wages, lodgings, hours and holidays, does not indirectly affect the master's pockets, things should go ahead.

In a general organization only can vigorous advancement be expected, and the onus attached to individual effort, or the danger of any man being told he is free to leave what he does not like, reduced to a minimum. One cannot but think that masters whose attention is diplomatically directed to what is being done for the betterment of gardeners, by illustrations of model gardeners' cottages and bothies; by notices of places where better wages, less hours and more holidays rule; by pertinent articles from men and their masters, too, who have had experience of this government of their gardens—one cannot but think that the effects would be wide and far-reaching and worthy of the great cause all have equally at heart.

Is it not time that a move should be made in the matter? And is it not possible to move so vigorously, yet so tactfully, that even the most conservative masters shall say: "Your gentleness shall move our force more than your force shall move our gentleness."—QUIZ:

### The Horticultural Journal.

Registered with a capital of £3,500, in £1 shares, to acquire and carry on the business of printers and publishers of the "Horticultural Journal," general printers, &c., carried on at Spa Mill, Padiham, as Cooper and Co., and to adopt an agreement with C. M. Cooper, J. Simpson, and W. Baldwin.—("British and Colonial Printer.")

## Societies.

### Royal Horticultural, September 1st.

The following Chinese species of *Vitis*, each an ornamental climber, were staged by James Veitch and Sons, Ltd., Chelsea:—

*V. armata*.—This is as vigorous in growth as *V. Coignetiae*, and has broadly ovate entire leaves, the petioles and main stems being abundantly studded with nearly erect spines. A handsome and showy species. Award of Merit.

*V. megaphylla*.—This is a species with much compounded leaves, reminding one more of a *Koelreuteria* than of a *Vine*. The green leaf with reddish petiole measures about 16in long. From Central China. Award of Merit.

*V. Thomsoni*.—A remarkable and attractive species. The leaves are five-lobed, of a reddish shade on the upper surface, and a distinct violet-purple on the reverse side. They are supported on short stalks about 5in long. By means of tendrils the stems and branches readily obtain support. From every point of view this is a valuable climber. First-class Certificate.

*V. flexuosa Wilsoni*.—A slender-growing variety with ovate, acuminate leaves 2½in to 3in across. Award of Merit.

*V. sinensis*.—This *Vine* has the peculiarity of producing simple cordate leaves and three or five parted leaves on the same plant. Thus it will be seen to be a variable species, yet not the less beautiful on this account. It is tall and vigorous, abundantly furnished with foliage. Award of Merit.

### R.H.S. Scientific Committee, September 1st.

Present: Dr. Cooke, V.M.H. (in the chair); and seven members.

*Hippeastrum species*.—Col. Tillotson sent flowers of a plant sent from South America. The petals were of a pale clear green, passing into primrose, the stamens and pistils bright pink, and protruding far beyond the petals, which were almost closed at the apex of the flower. Though not very attractive in colour, it was thought it might be useful to breed from, on account of the great substance of the petals.

*Raspberry, Wineberry, Blackberry Hybrids*.—Mr. H. Peerman sent specimens of the foliage (the fruits had fallen off, and could not be identified) of three hybrids, Blackberry x Raspberry, Raspberry x Wineberry, Wineberry x Raspberry. They were considered most interesting, and he was requested to send again next year, each in a separate box, with both fruit and foliage.

*Bud Formation*.—Mr. J. Robson sent "a section from a young Sycamore exhibiting the extraordinary facility with which this tree develops wood buds from the alburnum." The tree had been budded on the bare space between two leaves, and the bud had failed, but from the base of the incision the stock had sent out a growth "where no eye previously existed. I have twenty-five or more examples of the same thing in Sycamores, but though I have budded many subjects I have never noticed the same thing in any other genus."

*Hippeastrum Blistered*.—Dr. Bonavia sent some leaves of *Hippeastrum* "covered with something that looks like scale, but which adheres so closely to the epidermis that it is difficult to remove." The scale-like blotches, on examination, proved to be not of insect formation at all, but blisters due probably to defective root-action, itself due to a check of some sort, such as cold or too much wet.

*Cryptococcus on Weymouth Pine*.—Mr. R. Knight-Bruce sent a specimen of bark literally swarming with the white woolly or waxy *Cryptococcus* which attacks Pines, and which, he says, is rapidly spreading, and killing plantations of the Weymouth Pine. The Committee considers the case almost hopeless, but suggested spraying the trees with a paraffin emulsion. Mr. Wilks said he had but little hope in spraying *Cryptococcus*, as, unless the sprayer was peculiarly strong and powerful, the fluid would not penetrate the downy wax with which the insect covers itself over. He had known a case of a Beech tree being saved by hand scrubbing with a brush, using softsoap and paraffin emulsion; but he had never known spraying to be successful.

*Discoloured Vine Leaves*.—These were received from Mr. Neild, of Holmes Chapel. Dr. Cooke reports:—"Vine leaves with broad irregular patches of bright coloration have been known and observed for the past half century. Sometimes the colour is yellow, or becoming brown, and sometimes reddish, or claret colour. In America it is known as the California Vine disease (see U.S.A. 'Reports of the Department of Agriculture,' xx., 1892). This, or a similar disease, is known in Sicily as 'Folletage,' and in Italy as 'Mal Nero.' No satisfactory reason has yet been assigned for this affection, as no trace of fungi has been found, and there is no cause to suspect that fungi of any kind have anything to do with the discoloration. Leaves are constantly being submitted to the Scientific Committee for report as to the cause or remedy, but none can be given."

*Floriferous Sweet Pea*.—Mr. Hunt sent a flower-stalk of Sweet Pea having seven fine blossoms.

*Proliferous Helianthus*.—The Rev. C. Wolley-Dod, V.M.H., sent flower heads of this, remarking that one particular plant in his garden always produces them; and that, as a rule, small secondary flowers grow out of the disc.

*Campanula lactiflora, linear-leaved*.—The Rev. Wolley-Dod sent a curious "abnormal" form of *C. lactiflora*, which comes in

Spray of *Ixia*. (See page 248.)

S. & S.

small percentage from the seed of the typical form, perhaps one in 200. The linear leaves can be recognised early in the seedling stage, and I never saw intermediate forms. Analogous forms with stellate flowers are not uncommon in *Campanula rotundifolia*, and De Candolle in his "Monograph of *Campanula*" figures

and describes one on *Campanula medium*, which he considered unique in the genus.

*Silver-leaf disease in Apples and Plums.*—Mr. Gaut brought specimens from an orchard of seven acres in Yorkshire. The soil is warp-land, varying in depth from 1ft to 3ft within short distances, and overlying clay. The drainage is good, with drain-pipes. Shelter is afforded by the fruit trees in the orchard. The altitude is nearly sea-level. The general culture has been to give a good dressing of farmyard manure every four years and lime every few years. The trees had been planted ten years,

*Scilla campanulata rosea.*

J. L. & S.

and silver-leaf appeared three years ago and gets worse every year, and the trees affected in summer die the following year. The varieties affected are Victoria Plums, of which there are about 500 trees; and Lord Grosvenor Apple grafted on Keswick Codlin stock.

Mr. Gaut remarked that the matter was creating considerable interest in Yorkshire, and the soil had been analysed with the following result:—

THE AIR-DRIED SOIL CONTAINS IN 100 PARTS:—

Water	3.10 per cent.
Loss on ignition (organic matter, combined water, &c.)	5.09 "
Mineral matter	91.81 "
	100.00

Containing nitrogen	0.151 per cent.
Equal to ammonia	0.183 "

The soil was free from root-fibres, or any visible organic material.

It had been said by some experts that silver-leaf was due to a lack of nitrogen in the soil, but the analysis seemed to show this could hardly be the case. Dr. Cooke said that the disease was so mysterious because he could find no spores or mycelium of fungus and no bacteria. He knew of no remedy, but advised cutting out the parts affected the moment the disease was seen and burning them. See also "Royal Horticultural Society's Journal," vol. xxvii., pages 713, cxliii., and cxlix.

*Rose leaves diseased.*—Mr. J. W. Scott sent three bundles of Rose leaves diseased. "No. 1. The plants are in good health, and at present there is but very little of the disease on them. No. 2 is taken from small pot stuff spring grafted, and seems to develop those spots when grown in a high moist temperature. No. 3 appears to be like the last attacking plants that are in a soft growth, and we have it in several houses, in some cases stripping every leaf off the stem, but on taking the lights or glass off, the plants recover to a great extent."

Dr. Cooke pronounced the disease in each case to be *Actinonema rosæ*, called by growers the Black Mildew. It is a fungus disease very common all over Europe, and though it may be checked by Bordeaux mixture, no actual remedy is known. It was considered to be greatly stimulated and encouraged by

growing the plants too closely together without sufficient air and light, or in too humid an atmosphere. It is advised to dry the plants off and let all the leaves fall (which should be collected and burnt), and then induce them to make altogether fresh growth.

### Scottish Horticultural.

The September meeting was held in Dowell's Rooms, George Street, Edinburgh, on Tuesday, the 8th inst. There was a very large attendance of members, many from the country, the meeting being held on the eve of the Edinburgh Autumn Exhibition. There were a large number of new members elected and proposed. The paper of the evening was "The Cultivation of Vegetables," by Mr. Gibson, Danesfield, Great Marlow. Mr. Gibson's great fame as a grower and exhibitor of vegetables rendered his paper more than usually interesting, and the audience were certainly not disappointed.

Starting with very pointed instructions as to the general culture and the preparation of the soil, Mr. Gibson proceeded to give details as to his method of cultivating the leading sorts, both for culinary use and for exhibition, treating very shortly on the growing of Potatoes, Onions, Celery, Peas, Cauliflower, Beet, Carrots, Parsnips, Sprouts, Tomatoes, Leeks, and one or two other minor kinds. After the paper was read a number of limelight illustrations were given of some of the choicest varieties usually exhibited by Mr. Gibson, and of a number of collections which Mr. Gibson has recently exhibited with success. An interesting discussion took place on the paper, amongst the speakers being Mr. A. Mackenzie, Mr. Grieve, Mr. Sutton, of Reading, &c. A very warm vote of thanks was accorded to Mr. Gibson.

There were a large number of most attractive exhibits, which evoked great interest from those present. Messrs. Methven and Sons had a beautiful collection of early flowering Chrysanthemums, prominent being Golden Gem, Market White, Horace Martin, Mytchett White, &c. A cultural certificate was awarded. Mr. John Downie exhibited handsome seedling Carnations. Messrs. Todd and Co., Shandwick Place, had very beautiful vases of handsome new varieties of Montbretias, fine Comet Asters, grown where sown in the open air; Lady Fitzwygram Chrysanthemum, with long stems. A cultural certificate was awarded.

Mr. Todd also exhibited a handsome specimen of Carrie early yellow Chrysanthemum, raised by Messrs. Wells. A first class certificate was awarded. Mr. Smale, Blackford House, exhibited a nice lot of Streptocarpus, which were much admired. A number of handsome new varieties of Lobelia cardinalis were sent by Mr. McHattie from the public gardens; also a gigantic Hydrangea, nearly 5ft high, with a single stem and a head of bloom 5ft in circumference. A cultural certificate was awarded. Mr. Johnstone, Hay Lodge, showed a vase of handsome Fuchsias. Messrs. Methven and Sons were awarded a certificate of merit for their improved strain of Large York Cabbage, of which very handsome specimens were shown. A hearty vote of thanks was awarded to the exhibitors. A vote of thanks to Mr. McHattie, president, brought the meeting to a close.

*SCILLA CAMPANULATA ROSEA.*—The wild English Bluebell (*Scilla nutans*) is one of the loveliest flowers of spring, and one we would sacrifice a great deal for, rather than lose. Acres and acres, through shady copses and woods, are seen in May and June, and its albino variety is a much-prized gem in gardens of every sort. Nor are the varieties of *S. campanulata* (or *S. hispanica* of the botanists) less appreciated. We are able to figure the handsome *S. campanulata rosea*, and there are also white and blue varieties of this easily grown bulb. Edging lines to shrubbery borders or to formal paths in rustic flower gardens, are suitable places for these Scillas, and the blues and whites, or pink and whites, go well together.

*IXIA AND SPARAXIS.*—We do not know of any very successful culture of these graceful and showy flowers as open-air subjects. Like the Freesia they are somewhat too tender to be satisfactory, even in the warmest of our English gardens. True it is that a great many people grow them out of doors in sunny borders, especially when the soil is of a sandy nature, but they lack a bottom effect—they have no setting, no foil, and that is fatal. Ixias, however, well deserve good pot culture, and they refresh the conservatory wherever they are. Their culture is simple, though care is required at the start. They can be potted shortly. Messrs. Sutton's illustration shows a strong spray of Ixias. Sparaxis are very closely allied, and demand the same culture. Possibly their colours follow the richer tones more than do the Ixias. Messrs. Webb's block on page 249 depicts a showy potful of the bulbs in flower. For vases and glasses these flowers are almost indispensable. *Ixia viridiflora* has been suggested as a suitable floral emblem for the new Transvaal colony.

## National Rose.

### DATE OF THE METROPOLITAN EXHIBITION.

To the Honorary Secretary of the National Rose Society,—When, at the annual general meeting of the National Rose Society, held last December, it was decided by a majority of one to hold the Metropolitan Exhibition in the gardens of the Inner Temple on July 1st in preference to July 8th, some of us doubted the wisdom of the decision. A leading evening paper, in its report of the show, dated July 1st, states, "The National Rose Show this year is an exhibition representative only of the southern counties. The midland and northern counties will not be able to show for a fortnight or so. That the Southerner has had it all his own way will be seen by the record of the trophies and principal prizes." We may add to this, that in no instance was the Southerner at his best. But even if he was, the compulsory absence of the Northern and Midland growers, not only in this, but in several years past, seriously challenges our Society to the name of National.

At the Metropolitan Exhibition is held the friendly contest for the championship of the year. This gives it an importance not possessed by any other Rose show. When this is held Roses should be at their best. Can it be maintained that Roses are at their best between July 1st and 4th? Yet it is on these dates that the Metropolitan Show has been held six times during the last seven years. We are, therefore, of opinion that the Metropolitan Exhibition is held on too early a date.

If it be pleaded that this exhibition should be held alternately, early and late, we would reply that the latest date on which this show has hitherto been held is not late, but barely midseason. And, mindful as we are of the large number of exhibitors residing south of London, we nevertheless think that the interests of individual exhibitors should be subservient to the interests of the N.R.S. as a whole; we desire that the public may see the Roses at their best, and that the Metropolitan Show may be recognized as the best Rose show of the year. Distance from London militates against a representative gathering of rosarians at the annual general meeting. We therefore deprecate that the fixing of the date of this important exhibition should be left altogether to a chance majority of those attending and voting, and we ask that to "Regulations to Exhibitors," should be added these words, "The Metropolitan Show shall not be held earlier in the year than July 6th."

S. Reynolds Hole, President, The Deanery, Rochester; F. R. Burnside, Vice-President, Great Stambury Rectory, Roehford, Essex; George Gordon, Vice-President, Kew; E. B. Lindsell, Vice-President, Bearton, Hitchin; Henry V. Machin, Vice-President, Gateford Hill, Worksop; Joseph H. Pemberton, Vice-President, The Round House, Havering-atte Bower; Alfred Tate, Downside, Leatherhead; W. Wilks, Vice-President, Shirley Vicarage, Croydon; R. N. G. Baker, Vice-President, Heavitree, Exeter; H. H. D'Ombra, Vice-President, Westwell Vicarage, Ashford, Kent; J. Ramsay (Capt.), Vice-President, Yvery House, Fareham; A. Foster-Melliar, Vice-President, Sproughton Rectory, Ipswich.

[Extracts from the annual reports of the National Rose Society for the past seven years then follow, showing that only in two years out of seven was the Metropolitan Exhibition a good one.—Ed.]

A few copies of the above memorial have been circulated for signature. There has already been a ready response. May I ask those members of the N.R.S. who have not received the circular, and who, approving of the memorial, desire that their names should be added, kindly to communicate with me?—JOSEPH H. PEMBERTON, Havering, Essex.

## Cardiff Gardeners'.

Through the kind invitation of Mr. John Basham, Fair Oak Nurseries, Bassaleg, thirty of the members drove to Bassaleg and were entertained by Mr. and Mrs. Basham to tea a day or two ago. Afterwards the party were conducted through the fruit gardens, where a fine, healthy, and large stock of Apple and Pear trees are carrying very heavy crops. Particularly so are the following varieties, viz.: Allington Pippin (remarkably fine), Bismarek (grand), Col. Vaughan, Ecklinville Seedling (an enormous crop), Lady Sudeley, Lane's Prince Albert (very heavy cropper and an abundant supply), The Queen (spoken of as a shy bearer, carrying enormous crops), Schoolmaster (good), as also were Stirling Castle and Warner's King, and very fine fruits of Peasgood's Nonesuch.

Young Pear trees on walls were carrying good crops. Plum trees were remarkably good. A cleaner and healthier lot of fruit trees it would be impossible to find, and though Mr. Basham suffered failure last year, he is amply rewarded this season, for tons of Apples are near maturity for storing. Light refreshments were served in the gardens. After thanking Mr. and Mrs. Basham for their kindly hospitality, the brakes conveyed the party back to headquarters, after spending a most enjoyable outing.—JOHN JULIAN.

## Ipswich Mutual Improvement.

A well attended meeting of the above society was held on the 3rd inst., Mr. J. Morgan occupying the chair. A paper on "Decorative Plants" was read by Mr. H. J. Southgate, St. Helen's Nurseries, Ipswich. The particular phase of the subject which the essayist treated was that of plants adapted for the decoration of the mansion. For this purpose it was necessary that the plants selected should be of such a nature as to stand exposure to such adverse conditions as insufficient light, cold draught, effects of gas, &c., or, on the other hand, should be of such quick growth and so readily propagated that fresh stock could be easily worked up to replace those destroyed. Amongst suitable plants for the purpose Palms occupied the foremost position. Ferns, Crotons, Dracænas, Aspidistras, Grevilleas were of great value, while among flowering plants Richardias, Poinsettias, Heaths, Bouvardias, Primulas, and many other kinds might be pressed into service. Considerable discussion arose out of many interesting cultural details given by Mr. Southgate in the course of his paper, at the close of which he was accorded a hearty vote of thanks on the proposition of Mr. E. Creek, seconded by Mr. Whittell.—E. C.

## Eaglesfield, Dumfriesshire.

One of the most successful and extensive Scottish flower shows is that held at Eaglesfield, Dumfriesshire. It is conducted on the same lines as many other country shows, having classes for many non-horticultural subjects, but the horticultural classes are not only numerous, but draw exhibitors from a wide area. As usual, this year's show, held on September 5, was exceedingly successful, though as is usual everywhere this season, fruit was exceedingly short, and not up to its usual quality here.

Pot plants and vegetables were very fine, and cut flowers were good, though the heavy rains and windstorms had left their traces upon many blooms. In the open classes the most successful with pot plants were Mr. Wm. Webster, Springhill Gardens, and Mr. W. Anderson, Mossknowe Gardens. In cut flowers Mr. E. Cameron, Ericstane, Moffat, led in Roses, Antirrhinums, "Geraniums," buttonholes, and herbaceous plants; Mr. W.

Webb & Sons.

Sparaxis.

Veitch, Carlisle, in Stocks, Dahlias (all but single, where Mr. J. Burton, Penrith, was first), Gladioli and quilled Asters; Mr. D. Whitelaw, Locharbriggs, was first in Marigolds; Mr. A. Ruthven, Eaglesfield, in Phloxes; Mr. J. Johnstone, Lockerbie, in Pentstemons. Mr. E. Cameron was first for Currants, Peaches, and Grapes; Mr. T. Burton for dessert Apples; Mr. W. Orr for cooking Apples; Mr. W. Webster for Plums and Melons. J. and R. Currie were first and second for a collection of vegetables,

and other winners of first prizes in this section were W. Anderson, J. Currie, D. Brown, T. Downie, J. Wright, J. Burton, J. Friendship, J. Blake, Jas. Harkness, W. Veitch, J. Thomson, T. Henderson, E. Cameron, T. Taylor, A. Carlyle, J. Irving, and B. Bell.—S.

### Croydon Improvement.

A new departure in the programme of the Croydon and District Horticultural Mutual Improvement Society was successfully carried out at their rooms, Sunflower Temperance Hotel, on Tuesday evening, when "Discussions on Floral Decorations with Demonstrations" created a very enjoyable two hours' entertainment. The principal interest was centred on three dinner tables, which had been tastefully and artistically decorated by Messrs. M. E. Mills, A. Maslen, and P. F. Bunyard respectively, and the decorative excellence in the floral art displayed by these gentlemen called forth a very meritorious word of praise from all present.

### Edinburgh Autumn Show.

The great annual autumn exhibition of the Caledonian Horticultural Society was held on Wednesday and Thursday of this week, and was a great success. The entries all over were very large, though, owing to the poor season some sorts of fruit were not so numerous as usual, and the total entries were thus slightly fewer than those of last year. Grapes were a very fine show, both in quantity and quality, while plants and cut flowers were up to former years.

The exhibits by nurserymen were very numerous and highly attractive. Year by year an increasing number of the trade are anxious to exhibit their specialities in the capital of Scotland, till it is with the greatest difficulty that all the exhibits can be accommodated even in the capacious Waverley Market. At the time of our going to press it is impossible to give a detailed report of this fine exhibition, and this must stand over till next week. Just as we go to press our reporter wires the decisions of some of the leading classes, as follows:—

In the fruit classes, Mr. J. H. Goodacre, of Elvaston Castle, Derby, who was invincible at Shrewsbury, here in the further North was first for the fruit on the decorated dessert table, though only third for the decorations. Mr. D. Kidd, of Carberry Towers, Musselburgh, was second for fruit, and first for decoration; while Mr. W. Smith, from Oxenford, was third for fruit and second for decorations.

For the ten dishes of fruit Mr. Goodacre again was foremost; Mr. Mackinley, of Amptill, Beds, coming second. Messrs. D. and W. Buchanan, of Kippen Vineyard, Stirling, were the champions for six bunches of Grapes; and second Mr. Beisant, of Castle Huntly. For the four bunches Mr. Goodacre was leader, and Messrs. Buchanan second, the struggle being as tight as at Shrewsbury.

For the brace of Muscats, Mr. Hughes, of Kingsmeadows, beat Mr. Goodacre. The latter won for the two bunches of Hamburgs. The Dunn Memorial Medal and first prize for a collection of Scotch-grown Apples fell to Mr. R. Sinclair, of Congleton, East Lothian. The leading prize for a collection of vegetables was ably won by Mr. Gibson, of Danesfield, Great Marlow (whose essay we note in the report of the meeting of the sister horticultural society of Edinburgh, i.e., the Scottish Horticultural Association). Mr. Harper, of Tulliebelton, was second.

Mr. Geo. Wood, of Oswald House, Edinburgh, was first for a group of plants set up for effect. In the nurserymen's classes, Messrs. Cocker and Son, from far Aberdeen, led the way for a collection of hardy border flowers; and they added firsts in the classes for thirty-six, eighteen, and twelve Roses respectively, Messrs. D. and W. Croll, of Dundee, coming second in these latter classes, and Mr. Hugh Dickson, of Belfast, third. For the dozen vases of Roses Mr. Ferguson, of Dunfermline, was first, Messrs. Cocker second, and D. and W. Croll third. It was a fine show, and drew a large number of visitors.

Amongst trade exhibits which were being arranged when our reporter wrote were Messrs. R. B. Laird and Sons, a very large group of Palms, Lilioms, and Azalea mollis; Mr. John Downie, Messrs. Dickson and Co., Messrs. Thos. Methven and Sons, Messrs. Storr and Storr, Dundee; Messrs. Dobbie and Co., Rothesay; Messrs. Grieve and Sons, Redbraes; Mr. A. F. Dutton, Bexley Heath; Mr. Jannock, Dereham; Mr. Forbes, Hawick. Messrs. Todd and Co., florists, show a very beautiful table of bouquets and designs, all most tastefully executed in Roses.

### Trade Catalogues Received.

#### Bulbs.

Bakers', 67, Lichfield Street, Wolverhampton.

R. Veitch and Sons, 54, High Street, Exeter.

Vilmorin-Andrieux and Co., 4, Quai de la Megisserie, Paris.—Also Strawberries.

Wm. Watson and Son, Clontarf Nurseries, Dublin.—Carnations.

## Weather Notes.

### Temple House Gardens, Great Marlow, Bucks.

The register of rainfall here for August, 1903, was 4.00in, and for August, 1902, 3.65in. The maximum temperature for August month, 1903, was 76deg on August 8, and the minimum 40deg on the 21st. The maximum for August, 1902, was 78deg on the 29th, and the minimum 44deg on the 10th of the month. In August, 1903, there was hail and thunder on the 10th, a gale on the 15th, thunder on the 17th, heavy thunder and rain on the 24th. On the latter date 0.94in was registered between 9 a.m. and 4 p.m.—GEORGE GROVES.

### Sussex Weather.

The total rainfall at Abbots Leigh, Haywards Heath, for the past month was 4.05in, being 1.64in above the average. The heaviest fall was 0.93in, on the 14th. Rain fell on fifteen days. For the fourth time since 1880 we have had an August rainfall of over 4in, viz., 1881, 4.63in; 1893, 5.83in; and 1902, 4.18in. The maximum temperature was 73deg, on the 13th; the minimum 40deg, on the 23rd; mean maxima, 68.28deg; mean minima, 50.20deg; mean temperature, 59.24deg, which is 0.74deg below the normal. This has been a wet, sunless, stormy month, and a very bad one for both gardeners and farmers. The land has been so continuously saturated that it has been impossible to get Potatoes out of the ground, and now there are about two-thirds of them diseased and completely useless. Late Peas do not fill out, and except we get brighter weather will be a failure. The harvest, which is generally finished by now, is still mostly in the fields, and is much damaged by wind and rain.—R. I.

### Notes from Hamilton, N.B.

The weather is an ever prominent topic of discourse here. The whole of August was very wet, varied with a few storms of high winds, which, of course, did much harm in gardens and fields. The whole year has been inauspicious, but many had hopes that August would turn in to compensate, in a measure, for the past; but despite the German prediction that the month of August would be on the whole a good one, it was, in fact, among the worst. And now September is with us, and those of us in whose breast hope springs eternal, looked forward to this month for better luck, but have, as yet, been unrequited, for every day since the month began has been wet.

Strange to say, wasps have been a veritable plague among indoor fruits. I do not remember of seeing so many for years, and never under similar conditions. Probably this is due to the dearth of outside fruit. District flower shows have suffered from the backwardness of the season.—D. C.

## Trade Notes.

### Clibrans' New Grounds.

In their new Carnation and Pansy list, just published, Messrs. Wm. Clibran and Son have the following notice:—"All our glass houses, offices, packing department, &c., are now removed from Oldfield to a new site at Bank Hall Lane, Hale, 15 minutes' walk from Hale Station."

### Thos. S. Ware, Ltd.

Messrs. Ware, in sending their bulb catalogue, point out that they have opened a London shop and depôt at 25, York Road, Waterloo Station approach.

NARCISSUS TAZETTA.—That variety of the Polyanthus Narcissus which we grow here in England (often in fancy bowls simply filled with pebbles and water) as the Sacred, or Good Luck Lily of China and Japan, owing to the facilities offered by the trade for securing good bulbs cheaply, has long been one of the leading favourites amongst the kinds that are early forced. The flowers are deliciously scented, and not too powerful, while the white perianths and yellow cups, in clusters, are charmingly sweet. Each bulb produces several flower spikes. Large numbers of amateurs who have but little greenhouse or plant-frame accommodation, can grow this Chinese Sacred Lily. And it is most interesting to watch the growths as they quickly grow—quick, that is to say, as far as plants are compared. It will make twenty inches in forty days. In basins or bowls, the bulbs can be grown in dwelling-houses, placing the plants near the window by day, but away from it (or from draughts and chills) during the night. Our illustration is from Sutton and Sons.

## Neglected Lines in Hardy Bulbs.

That fickle mistress—fashion—at whose slightest nod so many are ready to pay obeisance, exerts an enormous influence upon gardening as well as in other things. Styles of gardening come and go; plants come into popularity and then pass into obscurity. Opinions differ as to whether this is a benefit or no, but it must be admitted that fashion has done much to stimulate the improvement of a flower, and has led to vast additions to its beauties. Even the movements of fashion when carried to excess have brought in their train benefits which have been handed down to distant generations. One need only cite a familiar example in the craze for Tulips which raged in the time of the tulipomania of past days, which, with all its extravagance and folly, led to an advance in and the improvement of this fine flower. On the other hand, these changes of fashion have had an evil influence as well. Plants of equal beauty to those which have become fashionable have been thrust into the cold shades of neglect, some to become lost to cultivation, but still more to linger almost unseen in out-of-the-way places or in botanic gardens, visited only by a few of the great populace of our country. Then some plants as susceptible of improvement as the flowers which become the favourites of fashion have remained as they came from Nature's laboratory, beautiful enough, but not perfected by the skilful culture and work of the florist. What has been done with the Hyacinth, the Tulip, the Iris, the Crocus, or the Gladiolus by means of the hybridisation of a few species, might have been performed and may still be done with many other lovely bulbous flowers which await a like share of attention. The results yet to be achieved may absolutely revolutionise our gardens.

Apart, however, from these phases of the subject, a still simpler one calls for notice. This is the manner in which the average gardener—amateur and professional—fails to utilise many of the bulbous, cormous, or tuberous plants ready for him, and contents himself with working upon the old and stereotyped lines. Let us look at a few of the plants which occur to one in thinking over the subject, and a rapid alphabetical survey brings us almost at once to a genus of flowers, many almost worthless for the garden, but many again of great beauty. This is the genus *Allium*, comprising a number of summer-flowering bulbs which are not well enough known either for planting in grass or, the choicer members alone, in the border or rockery. How many know the pure white, drooping flowers of *Allium triquetrum*, or the pretty blooms, equally white, but closer heads, of *A. sub-villosum*, not to take account of the many others never seen except in the garden of the enthusiast. Then one might think that the *Anemones* would be sufficiently appreciated, but, while this is true of such flowers as *A. coronaria* and *A. hortensis* and their varieties, there are thousands of gardens where the lovely early *A. blanda*, flowering often in the south with the dawn of the year, or even the cheap *A. apennina*, as hardy as our common Wood Anemone, is quite unknown. Then how many know even the yellow *A. ranunculoides*, with its sulphur-coloured variety, *pallida*? Not one in a thousand, I venture to affirm.

Then we have another class of bulbous or cormous flowers in the *Antholyzas*, almost of barbaric beauty in their colouring, and among the best of our autumn bulbs. Such fine species as *A. paniculata* is of great value, with its handsome leaves and fine scarlet and yellow flowers. Were it taken in hand and an effort made to hybridise it with some of the *Montbretias* or

other allied plants we might have results which would amount almost to a revolution among our hardy bulbous flowers.

Much has been done of late by various firms of note, to popularise the *Brodiaeas* and *Bloomerias*, but the heaven has not yet permeated the world of gardens as a whole. Such summer-flowering bulbs are of inestimable value, and the time ought to come when they will be largely used either in beds alone or in groups. How far some of these are suited to planting in grass is not properly known, but could we succeed with a mass of *Brodiaea ixioides* or others of the genus growing in the grass we should obtain a new feature altogether in our gardens. Or this and others might be carpeted with some surface rooting annuals, through which the flowers would spring, and which would compensate for the leaves of the bulbs, which pass away ere the flowering is over. Then the lovely *Calochorti*, though they require some care in the open, should be far more widely grown.

*Bulbocodiums* and *Colchicums* afford much room for greater regard, the former mainly for spring and the latter for autumn. The old purple-coloured *Bulbocodium vernum* makes a fine show

in early spring before the Crocus, while the best of the *Colchicums* are far superior to the old *C. autumnale*. Such species as *C. speciosum* or *C. Bornmuelleri* may well be called the Tulips of the autumn, and ought to be more largely grown. Then the double Meadow Saffrons are such free-flowering and lasting things that their neglect is almost inexplicable. The *Crocus* and *Montbretias* cannot be said to be "neglected lines," but many of the *Crocuses* would come correctly under the category. Who that has seen thousands of the autumn-flowering *C. speciosus*, of *C. zonatus*, of *C. iridiflorus*, or of the beautiful *C. Imperati* of the earliest days of the year, and will not include many of the *Crocus* species among the "neglected lines"? Steady work on these and other *Crocuses* would yield a wondrous result, greater it may be than that which has followed from the cultivation of the favourite Dutch *Crocuses*.

Among the smaller bulbous or tuberous plants comparatively neglected are the *Erythroniums*, or Dogs'-tooth Violets, in their numerous species, the hardy spring and autumn *Cyclamens*, and even the old and cheap *Eranthis hyemalis*, the Winter Aconite. I know many, many gardens where this so-called "common" plant is absolutely unknown, while its congener, *E. cilicicus*, has only found its way into a mere handful of gardens where hardy flowers are especial favourites.

*Fritillarias*, except, perhaps, the noble *F. imperialis*, appeal mainly to the esoteric few, but some on whom the mantle of old James Justice may have fallen might with gain to gardening operate among the numerous species, and give us a new race of these chequered and curiously interesting flowers. In themselves, even as they are, the species repay the little care the majority of them require at our hands.

One may pass over the *Galanthus* or Snowdrop with the remark that the last word has not been spoken in the way of improvement here. Then the *Galtonia* is not neglected by some, but many more might use with great benefit the noble *G. candidans* for their autumn gardens. Viewing the glorious spikes of the *Gladioli* of the present time, we dare hardly include it among the "neglected" bulbs, but one may point out that there are many charming species among the plants of the genus, and that the good old border flower, *G. communis*, and the cheap *G. segetum*, are unworthy of neglect in themselves, and afford a profitable field of work for those who seek to raise a new and hardier race. One may also mention as worth some notice now the new *Dracocephalus* hybrids, or *G. princeps*, as flowers

**Polyanthus Narcissus, Her Majesty.**

to be procured by those who wish to cultivate little known. Among the closely related Scillas, Chionodoxas, and Puschkinias, we have some neglected plants of worth. *Scilla sibirica* is too widely grown to the exclusion, or almost so, of *S. bifolia*, a varied plant with pretty flowers and procurable in blue, white, flesh colour, and, more rarely, in pink; while there are various oddments, such as the true *S. amoena*, well worth considering. Then the dainty little *Hyacinthus azureus*, with its Muscari-like flowers very early in the year, is a lovely little thing. So is *N. amethystinus*, a gem of a later season. As for the dainty Puschkinias, or the tiny *Chionodoxa nana*, the Musk or the tasselled Hyacinths; how few there be that grow them.

Among the bulbous Irises there are many neglected plants. Because the Spanish and English Irises are cheap and beautiful there is no reason why we should not enjoy the pretty *I. sindjarensis*, the love'y little *I. Rosenbachiana*, the exquisite *I. reticulata* and its varieties, and the considerable number of others to be found in the catalogues of the bulb dealers. Then how small a number of gardeners know the little crimson *Lapeyrousia*, or *Anomatheca cruenta*, which is hardy in warm soils, and which looks so delightful in the shade. *Leucojums* are not absolutely neglected bulbs, but many more should cultivate the neatest of all, *L. autumnale*, which flowers from July onward with exquisite little white blooms. With these one may speak of the *Romuleas*, pretty summer-flowering Crocus-like bulbs, which want a warm place and a sunny situation. A word, too, must be said for the Lilies, hardly ever seen in gardens. Why need we devote ourselves almost entirely to *L. auratum*, *L. candidum*, *L. longiflorum*, *L. croceum*, *L. tigrinum*, and such—fine though they are—and neglect *L. Szovitzianum*, *L. pardalinum*, *L. Humboldti*, *L. Martagon dalmaticum*, and the many other choice *Liliums* at our command?

It seems an absurdity to speak of the *Narcissi* as among the neglected lines, but it must not be forgotten that there are many interesting and beautiful things among them which are seldom seen. If we look through Messrs. Barr and Sons' catalogue there will be found such gems as *N. cyclamineus*, *N. gracilis*, *N. Macleai*, *N. juncifolius*, *N. triandrus pulchellus*, and others which would delight those who could find for them a fitting place.

To conclude, one can merely glance at some of the *Ornithogalums*, such as *O. pilosum*; the *Oxalises*, such as *Bowieana*, or *enneaphylla*; the *Sternbergias*, not easy to flower everywhere, it may be, but worth many a trial before confessing one's self beaten; the charming *Zephyranthes candida*, and a few others of the genus, and to finish with, the many Tulip species, with endless variety of colour, shape, and size. All these show us that there are many neglected lines even among introduced hardy bulbs. Were a demand for these to arise it would lead to their being cheapened and brought in quantities within the reach of the masses.—S. ARNOTT.

#### Irish Gardeners' Association and Benevolent Society, Dublin.

The following address was received by H.M. the King at Dublin Castle on July 22, 1903, from the Irish Gardeners' Association:

To His Majesty Edward VII., King of Great Britain and Ireland, Emperor of India, &c. May it please your Majesty, we, on behalf of the Irish Gardeners' Association and Benevolent Society, beg to tender to Your Most Gracious Majesty, and to your illustrious Consort the Queen, our most loyal and hearty welcome on this your first visit to Ireland since your Majesty's accession to the Throne. Representing, as we do, a large body of your loyal subjects, who appreciate the great interest your Majesty takes in the welfare of those engaged in horticultural pursuits, and in honouring with your Royal patronage the Gardeners' Royal Benevolent Institution and the Gardeners' Royal Orphan Fund of England, whose objects are of a similar character to our own, we feel that the present is a fitting opportunity to express our sincere gratitude and profound respect on this occasion of your visit to Dublin, and we humbly hope and pray that it may be your Majesty's gracious pleasure at some future date to honour with your illustrious patronage the Irish Gardeners' Association and Benevolent Society.

THE RELATIVE VALUE OF LARGE V. SMALL BULBS.—The references and pictorial illustration furnished by Messrs. Sutton and Sons, of Reading, in their new bulb catalogue deserve the fullest publicity, for they are good. Their remarks are as follows, and their illustration we have used on the opposite page:—"We should like to remove one very common but erroneous impression. The value of a bulb is frequently estimated by its size, and this opinion especially prevails concerning Hyacinths. It is quite true that some varieties, when fully matured, are remarkably large. Others attain only a medium size, while certain Hyacinths are always below the average. There is also considerable diversity in the form and appearance. The essential point, however, is density. The accompanying illustration, reproduced from a photograph, shows at a glance that a large bulb may not contain the nucleus of so fine a spike as a much smaller bulb."

## THE BEE-KEEPER.

### Autumn Feeding and Preparation.

The essentials of safe wintering are numerical strength, plenty of good food, pure air, warmth, and dryness, but many bee-keepers in their preparations for winter fail to secure these requisites, and the inevitable trouble which they term bad luck comes. All colonies should be sufficiently strong to cover at least seven bars, and the majority of these bees must be young ones, these not having lost their vitality by labouring will be the ones to carry on the brood-raising, &c., at the most critical time in the following spring. The life of the worker bee is governed by the amount of work it is called upon to perform, and if queens cease laying too early in the autumn through lack of income the colony consequently goes into winter quarters with comparatively few young bees. The second essential is a sufficiency of wholesome sealed food in the proper position.

There is much doubt as to the exact quantity of food necessary to support a stock through the cold months, but if there are from 20lb to 25lb sealed by the middle of September it will be ample. Rather less water is necessary in making syrup for autumn feeding, five pints of water to 10lb of sugar being plenty. Syrup of this consistency will require very little evaporation.

The other essentials are warmth and dryness in the hive. Any leakages in the roof should be attended to, and quilts examined periodically throughout the winter, in order to ascertain if they are perfectly dry. Extra warmth is, of course, obtainable by dummies and quilting. Stocks which do not cover seven bars should be united, as if left to winter singly they will succumb through inability to maintain the requisite heat. Weak stocks are unable to evaporate the superfluous moisture from the syrup, and are consequently unable to seal it up, which renders them liable to dysentery. Every comb that the bees do not actually need should be removed.

During autumn feeding, all entrances should be narrowed to prevent robbing and loss of heat, the latter assists in the evaporation of moisture from the food. The object of slow feeding in the autumn is to artificially prolong the harvest at the cessation of which the queens discontinue breeding. This continued ovipositing is the greatest desideratum for wintering safely and coming out strong in the spring. The crowding of bees for winter is not always carried out as it should be. If contracting and feeding up is done early, i.e., the brood nest reduced to about seven bars of bees, they will have no alternative but to store the food in the upper portions of the combs and on both sides of the brood, and as the latter hatches the empty cells will supply the requisite clustering space, in the natural position.

Much of the success of wintering depends upon the location of stores, an abundance of which on the outside combs where the cluster cannot reach, will not compensate for a deficiency in the centre. If feeding in the autumn is allowed to drift until cold weather sets in the food will remain unsealed and liable to fermentation, and the bees will have no empty combs to cluster upon, which (even if a very powerful colony) places them at a great disadvantage in maintaining the required temperature throughout the winter.

American apiarists whose winters are much more severe than ours, recommend that the bees should be crowded into as small a space as they can be forced to occupy. The heat is thus prevented from escaping around the nest, and upward ventilation avoids any risk of moist vapours. It is well known that the strongest stocks consume less honey than the weaker ones during the winter months, and if economy is the object of the bee-keeper, the consumption may be minimised still further by uniting and contracting. It will be apparent that the temperature around a cluster of bees will be higher than in the remotest part of the hive, so that by contraction to a smaller space the insects are able to maintain a temperature of 65deg by consuming less honey.

This feeding causes a corresponding amount of activity which in the winter is injurious. Further, it is important to have young and vigorous queens for wintering, or else autumn stimulation to obtain young bees will be a dismal failure.

Before the middle of October stocks should be examined carefully, and all combs not covered should be removed, and where there is a deficiency of food it must be remedied by supplying bars sealed up. It is a bad practice to open hives in the spring, or to disturb them in any way during the months of quietude. If feeding has to be resorted to, wait until the bees are active some fine day when the temperature is between 50deg and 60deg, and then insert a bar of sealed stores, or, failing which, a cake of candy over the feed hole. At this period of the year candy must not have any substitute for pollen, such as peafLOUR mixed with it. Excrement is produced by pollen, not by honey and syrup, so that candy will be sufficient to sustain life until they can take flights frequently enough to prevent them discharging themselves on the combs and becoming generally dysenteric.—E. E., Sandbach.

### Fruit Forcing.

**VINES: MIDSEASON HOUSES.**—When the Grapes have been cleared from the Vines, divest the shoots of their laterals down to the principal buds, which are to be retained for next year's fruiting, but be careful to avoid injuring the old leaves, for upon their preservation and health depends the maturation and plumping of the buds, also the storing of nutrition in the adjacent wood, as well as the ripening of the growths, which is essential to a good break and proper development of the bunches in their early stages next season. Allow a free circulation of air, and in the case of luxuriant or young Vines, or where there is the least doubt about the thorough maturity of the wood, maintain a gentle warmth in the hot-water pipes. After the removal of the laterals clear off the remains of the mulching or remove the loose surface soil, particularly near the collar of the Vines, picking the old soil from amongst the roots, and supply fresh lumpy loam in its place. Avoid burying the roots deeply; a couple of inches is quite deep enough. They will push adventitious roots into the new material, and these can be encouraged to any extent by timely dressings or surface mulchings when the Vines are in need of support another season. If a handful or two of approved fertiliser per square yard is applied, it will aid the Vines wonderfully in the early stages of growth another year. Inside borders will need watering, so as to keep the soil healthfully moist. In the case of borders that are only partially made, a breadth of about 2ft may be added to the front, choosing dry weather for the operation, and compressing the materials moderately. If inside afford a good watering; if outside it will not be necessary unless the compost is dry.

**YOUNG VINES.**—Afford every encouragement essential to the perfecting of their growths, keeping the foliage clean, removing all laterals, as growth produced after this time is of little value, and maintain a warm, well ventilated atmosphere, until the canes are thoroughly matured. Any supernumeraries intended to fruit next season should have the laterals cut away to the principal buds, leaving, however, an outlet for the sap by a few joints of the laterals beyond the length of cane to which they are to be shortened, and be careful not to injure the principal leaves. If the wood does not ripen kindly, it may be accelerated by keeping the house rather warm in the daytime, so as to get a temperature of 85deg to 90deg from sun heat, opening the ventilators at night. Afford sufficient water at the roots to prevent the foliage becoming limp.

**LATE HAMBURGHES.**—Houses of these and other tender-fleshed Grapes that were allowed to start naturally may need a little fire heat to colour and finish the fruit satisfactorily, as they will when it is hopeless to do anything more with the thick-skinned Grapes. They should have a temperature of 60deg to 65deg at night, and 70deg to 75deg in the daytime, with a circulation of air constantly, and free ventilation when favourable. Water the inside border if necessary, and when the Grapes are only partially advanced in colouring and ripening. Only restrict the laterals to prevent overcrowding, as a good spread of foliage over thin-skinned black Grapes is the best safeguard against the sun taking colour out of them when ripe. When the Grapes are thoroughly finished reduce the temperature, maintaining it at about 50deg by artificial means by day and 5deg less at night, with a little air constantly.

**LATE THICK-SKINNED GRAPES.**—These are less affected by atmospheric moisture than thin-skinned, Mrs. Pince shrivelling in a house where there is sufficient moisture to cause Muscat of Alexandria to rot. They are also liable to give evidence of finish that will not bear close examination; therefore make sure that the berries are well finished right up to the shank before ceasing the needful aid from fire heat. In a confined atmosphere Gros Colman sometimes splits at the nose of the berries when ripening; also Gros Guillaume in less degree. Alicante and Lady Downe's finish better and in less time than any other late thick-skinned varieties; then the latter should be given more time, also the white varieties, Trebbiano and Syrian, and after they are apparently finished a temperature of about 55deg should be assured, with a rise of 5deg to 10deg by day and a circulation of air until the foliage is giving indications of falling, when a temperature of 50deg is sufficient. The inside border should be watered in the early part of a fine day and air be freely admitted, for it is not so much the moisture as the confinement that causes the berries to spot and crack. Outside borders will be quite damp enough from the recent rains. In case of very heavy rains it is advisable to cover outside borders with spare lights to throw off the wet, especially when the soil is liable to hold water, a sodden condition of the border inducing sourness and consequent shanking in the Grapes.

**LATE MUSCATS.**—The thin-skinned Muscats, as Canon Hall and Muscat of Alexandria, also Madresfield Court, are very impatient of a stagnant atmosphere, especially moist, the two former varieties spotting and the latter cracking. They require fire heat until thoroughly ripe, with a free circulation of air in the daytime and enough at night, with gentle warmth in the pipes, to insure a circulation of air and to prevent the deposition of moisture on the berries, being careful to admit air freely on fine mornings. Continue this until the Grapes are thoroughly finished, when a gradual reduction of temperature may be made to about 50deg at night. But there must not be any great hurry in this, as the Grapes put on colour long after they appear finished, and improve in quality so long as there are any leaves on the Vines. Keep the border moist by watering as necessary in the early part of a fine day, for though the leaves become yellow at the edges they have green parts that are more or less useful in elaborating and storing food. Moisture must be kept down by free ventilation; it is pent-up air with a sudden rise of temperature from sun heat in the early part of a fine day, or at any time, which causes moisture to condense on the berries and produce spot, when the berries speedily decay.—ST. ALBANS.

Large v. Small Bulbs. (See opposite page.)

### Kitchen Garden.

**SPINACH.**—A successional sowing of Prickly Spinach to stand the winter may be made, preferably in rows, as thinning out, weeding, and other cultural operations are more readily performed when the plants are in lines than otherwise. Seedlings well advanced from previous sowings should be thinned out, and weeds removed, plying the hoe between the rows to encourage growth.

**YOUNG CABBAGE PLANTS.**—From the earlier sowings there will be many plants ready for planting out, while others not yet large enough may be pricked out on a bed of fresh soil to strengthen for the final planting.

**SEEDLING ENDIVE AND LETTUCE.**—If the plants in the seed bed are crowded there should be no time lost in relieving them. The best plants must be planted out permanently on a sheltered border. Water well should the weather be dry.

**BLANCHING ENDIVE.**—Full-grown plants may soon be ready for use when blanched. There are various methods of carrying out the process. A commencement may be made only when the plants are dry, as if wet the foliage rots, especially the young and tender centres, which are the parts most appreciated. With some plants the leaves may be drawn together by

the points and tied over the hearts, but the more effectual methods are inverting pots, or laying slates over the plants. The exclusion of light soon brings them to the desired state of perfection, so a few plants only, according to the demand, ought to be dealt with at once.

**TURNIPS.**—A liberal sowing of seed may be made now in rows nine inches apart. The ground should be moderately rich and well pulverised, working some wood ashes into the surface. Form shallow drills with the back of the rake, and sow the seed thinly. Seedlings from former sowings must be thinned as soon as possible, carrying out the operation at several times until the plants stand at a reasonable distance apart.

**BEANS.**—Scarlet Runner Beans will continue to produce pods so long as those of a useable size are picked, and not allowed to remain to develop and produce seed. Of course, where dependence is placed upon home-saved seed an adequate number of pods should be left for the purpose. Beans being gross feeders, the ground on which they are growing soon becomes impoverished of food and moisture. Plenty of water and liquid manure ought, therefore, to be supplied now, laying down some manure as a mulching. On this the liquid food may be poured, as it serves well to convey the moisture, and also shades the soil, preventing it being hard baked by the sun.

**LATE PEAS.**—Healthy and vigorous rows of late varieties should be kept in that desirable condition by affording a mulching of manure down each side of rows. This will conserve the moisture, and keep the roots cool. When the pods have formed and are swelling give liquid manure.

**POTATOES.**—As opportunity offers from the present time the main crops of tubers should be lifted, commencing with those varieties which show signs of the haulm ripening. If disease shows itself at all the crop will be better out of the ground, so as to prevent the disease spreading. A dry period, if it can be secured, is best for Potato lifting, as the tubers may then be spread out in the open air to thoroughly dry before storing. Sort the tubers into sizes, giving the very smallest to pigs, or cooking them to use with poultry food.

**CELERY.**—The rows of well grown plants constituting the main crops may be gradually finally earthed. The leafstalk ought to be loosely secured before applying the soil, which must be thoroughly broken up and pressed round the plants with the hands, avoiding letting any drop into the centres. At the final earthing bring the soil to a sharp slope on each side the row, carefully compressing the sides smoothly with the spade to allow moisture to drain readily away.—EAST KENT.

### Orchids: The Week's Cultural Notes.

As the last leaf is completed on such *Dendrobiums* as *D. crassinode*, *D. Devonianum*, *D. Pierardi*, and *D. Wardianum*, remove the plant to a lighter and airier position. This induces a restful state, followed in due course by free flowering. Just at first the water supply must be well maintained, but as the foliage turns colour and falls a very much smaller quantity suffices, just enough, in fact, to prevent shrivelling of the stems. If left too long in the growing quarters the plants break into a second growth inimical to flowering, as it breaks up the proper yearly cycle of growth, rest, and blooming.

Where resting Orchids, such as *Thunias*, *Anguloas*, *Dendrobiums*, and others, have been placed outside, a watchful eye must be kept on the weather. After the first week of September they are unsafe without at least the protection of a frame, for the nights are often bitterly cold even when no frost occurs, and the first-named Orchids especially are easily injured. *Cœlogynes* and *Cypripediums* in cold frames are best covered at night, removing the covering material the first thing in the morning, but in frames where a little warmth can be turned on at night they will be perfectly safe for a couple of months yet.

Preparations must now be made for a thorough overhauling, cleaning, and repotting or surfacing where necessary of the plants in the cool house. *Odontoglossums* of the *crispum* and *Pescatorei* types, *O. Halli*, *O. triumphans*, *O. luteo-purpureum*, and others should soon be emitting new roots from young bulbs, and if attended to in time these will run freely in the new compost, and soon re-establish the plants. Up to the time that they fill the lesser 60-sized or 3in pots small shifts only are necessary for these plants, but when strong and well rooted in these a somewhat larger shift is advisable, using 5in pots, but keeping the compost very thin over good drainage. Good peat and sphagnum moss or Belgian leaf soil is the best compost.

As the *Disas* go out of flower they must not be dried off, as they commence growing again almost before the old stems die off, and the young shoots want nutriment. Thrips are very troublesome to these showy and beautiful plants, necessitating constant cleansing. If they have been taken to the flowering house to bloom they will quite probably be severely attacked. The removal of the old stems after they have ceased to be of value to the plant often has the effect of clearing many insects, but this must not be done while they are still green, or the crowns for next season will be weakened.—H. R. R.

\* \* All correspondence relating to editorial matters should be directed to "THE EDITOR," 12, MITRE COURT CHAMBERS, FLEET STREET, LONDON, E.C. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense. In naming plants we only undertake to name species, or well-marked varieties, and only six on any one occasion.

**ABNORMAL BEGONIA FLOWER** (Mrs. C.).—The form in the flower you send seems to be owing to concentrated vigour, causing a multiplication and monstrous growth of the stamens and pistils. These essential organs are becoming metamorphosed into true petals, as may be seen in the outer parts of the flower. Begonias often do this.

**MELON LEAVES RUSTED** (W. S.).—We examined the leaves carefully, but the microscopic scrutiny was fruitless, no fungous or animal pest being found. The plant was quite sound in the roots, root-stem, and stem above ground, the leaves only browned and died back from the edges, the older leaves having considerable traces of "rust," which is due to the very pernicious puncturing of the tissues by a mite (*Tarsonymus* sp.) and the mode of reproduction in the cuticular cells, this giving rise to the "rust," while the nature of the infection causes the leaves to die back from the edges and curving downwards probably serve the purpose of protecting the mite or its progeny from moisture. The mite is rather a common pest in green-houses and stoves, infesting *Pelargoniums*, particularly Ivy-leaved, and *Begonias*, while in stoves it is often very destructive to *Gesneras* and *Gloxinias*, the foliage, usually stunted and rusted, for the most part ruined. In recent years the mite has attacked a number of plants, commonly those with fleshy or hairy leaves, and in rare instances attacks Melons. The only known preventive and repressive means is spraying with tobacco water, 1oz of the strongest shag tobacco being placed in a vessel and a quart of boiling water poured on, covering up closely and allowed to stand until cool, then straining and spraying on, it being important to wet the foliage on the under side. Probably in your case the mite has come from other plants, the house being more or less infested, hence spraying the whole structure inside would be advantageous, the tobacco juice of dealers diluted to a safe strength being used. It is necessary to repeat the spraying occasionally, it being more effective than tobacco smoke or nicotine vapour.

**PEAR TREES GOING OFF** (C. W. R.).—From the data, but in the absence of specimens, I should say that the trees are infested by a fungus closely allied to, if not identical with, that known as Cherry Leaf Scorch (*Gnomonia erythrostoma*), a disease which every now and again proves destructive to the Cherry crop in various parts of Europe, and I have noticed its occurrence on Pear trees in North Yorkshire and also in Hertfordshire. The leaves are attacked usually early in June, soon presenting a scorched appearance, withering, but hanging on to the tree throughout the winter in the case of the Cherry, while in that of the Pear the leaves commence falling towards the end of summer, though in some cases they hang on late; even here and there twigs are seen over winter with the withered leaves still adhering. Long, slender, colourless, curved conidia are first produced in perithecia seated on discoloured spots on the leaves. During the winter the ascigerous form of fruit is also produced on dead, hanging (or fallen, in the case of the Pear, if not Cherry) leaves, and the spores liberated start the disease anew.

If this be the affection, all the dead, infected leaves hanging or fallen, must be collected and burned. This, to be effectually preventive, must be general throughout the infected district. Where carried out thoroughly for two seasons, the Cherry or Pear crop, which previously has been completely ruined, may be restored to its former productiveness.

As regards the Pear trees being struck by lightning, I have no knowledge nor can I find record of such occurrence. Indeed, it hardly seems likely, as "C. W. R.'s" trees are affected similarly to a neighbour's on much higher ground, and I assume a considerable distance away. Lightning is local, seldom striking trees over a wide area, the greatest I have seen being with Lombardy Poplars, and then not more than ten yards, the central tree of three being killed entirely, and now covered in part with Great Bindweed (*Convolvulus sepium*) beautifully in flower, while the trees on right and left respectively are only scorched on the side next the killed tree, and most at top, this

part being more or less killed, but the other side and lower part pushed new growths freely.

Possibly the Pear trees may have been struck by lightning, but I hardly think the data conclusive, the evidence of exudation on one tree not indicating electrocution, for it is of a burning, dry nature. Indeed, the affection points to fungoid origin, and most likely is that foreshown. If so, the trees will push new growths another season; and if lightning it is remarkable the trees have not started into new growth from the sound parts of the wood this summer, as it seldom occurs of trees being killed outright over a wide area, and even individual trees are not always killed by lightning, but in part only, and then new growth pushes from the sound living parts.

**SHIFTING YOUNG PELARGONIUMS** (Inquirer).—If they are Zonals they should, when the small pots are filled with roots, be transferred to 6in pots, potting firmly, placing them in a light position, and with a little heat the plants will flower in winter. If, however, they are of the Show, Spotted, or Fancy section, they may also now be repotted and have the shoots stopped so as to induce a branched habit, keeping them near the glass and the house freely ventilated.

**SPENT TAN** (Ramalho).—Such old "rotten" tan as you describe has very little manurial value. If the tan is in a friable state it may be applied beneficially to very heavy land, such as clay or strong loam, but no benefit will result if it is mixed with ordinary light garden soil. Some pastures we have known to have been benefited by a heavy dressing of old tan, and this is possibly the most likely way in which your heap may be utilised—that is, if you have no heavy garden ground that requires to be made more friable.

The week opened with fine, bright, and warm weather, becoming less settled towards the end, very heavy rain falling on the evening of the 4th, accompanied with thunder and very vivid lightning.

1879 as Against 1903.

Why, the reader will ask, are these two years treated of together? Twenty-four years apart, a good many of us have but vague remembrance of 1879. It was not a Jubilee year, a Coronation, or a great war; no public feature of any mark. But, nevertheless, it is a time well remembered by those who were unfortunate to be farming then. We were going to say by those farming in the northern half of the kingdom; but, really, the disasters of that year were so evenly distributed that each and all got a fair share. What were the leading characteristics of 1879? Cold, wet, storm, lack of sunshine—a formidable array. In 1878, from June onward, the weather was unusually wet, causing a late harvest, and also affecting the well-being of lambs. It was not at all an unusual occurrence to find several lambs dead in the folds, or dying, more mornings in the week than was at all pleasant, and those which recovered were by no means in good condition to withstand a severe winter. Very early did winter set in (1878-79), and a very severe period it was, and of long duration. Practically up to Easter, 1879, it was all winter. We can even at this distant date remember how few days there were that could by any courtesy be spoken of as "spring weather," and Easter Day was ushered in by a snowstorm. The land being so wet and cold for such a length of time, was most unfavourable to the growth of Wheat, and many, many acres were ploughed up and re-sown with Barley or Oats. These crops, experiencing such continued wet, made straw, and little else. June came; still downpour. July followed with a few fine days, but these not till quite the end of the month. To show the lateness of the season, we may remark that in a well cultivated Midland garden there were no new Potatoes till the end of July, and Strawberries were equally late, even the earliest varieties (this before the days of The Noble). It was a case of hay making under difficulties, and the hay eventually secured was of the poorest quality.

In an article—"Daily Telegraph," August 31—it is stated that June, July, and August of this year (1903) have been better than the corresponding months of 1879, though the crops of '79 were worse. Now, we must not go against figures, but we really believe 1879 was a far wetter season. The harvest of 1879 was late in beginning, and on our farm not a stack was begun till Saturday, September 27, when leading was started; further North we dare not inquire. As to the fruit crop, it was plentiful; only Plums never got

to taste really ripe, and Apples, though large, were devoid of flavour. Nuts were most abundant, but English Walnuts never got beyond the stage of semi-ripe; the kernels never filled out at all. The mortality in lambs was great, but not so great as in the preceding year. The worst sheep trouble was yet to come, and come it did in 1880, when liver fluke made its appearance, and sheep in the low, damp districts succumbed in their thousands. On the higher grounds the mortality was not so severe.

If the corn harvest was late in 1879, what of the Potato harvest? It was prolonged into winter. The haulms refused to wither, the skins refused to fasten, but the tubers did not refuse to decay. There were absolutely no really fine, dry days for Potato getting, and therefore the tubers were stored wet and with a superabundant covering of earth, both most undesirable concomitants. It was impossible to thresh early, no corn in any way approaching condition, and all grain of every sort was sadly discoloured. We believe on many northern farms the grain crop was only fit for bedding. To set against all this disaster and loss, wool was a much better price than it has been for many years; but wool was a poor peg on which to hang all the farmer's prospects. The effect on farmers generally was very bad. Many received then what was practically their death blow, and laid up for themselves liabilities that neither they nor their heirs were ever able to discharge. Happy those men who got out of the business at some sacrifice; the first loss was the least. Revenue disappeared as thoroughly as though invested in an unlimited company.

Since the bad season of 1879, and also on account of the continued fall in prices, the cultivation of the corn crop has seriously diminished. The bad prices for wool resulted in a lessened head of sheep, which is in reality a double loss, for the sheep not only gives of its wool and mutton, but most materially adds to the fertilisation of the land that sustains it. The diminution of the Wheat area between 1874 and this present year of grace is something like 2,000,000 acres, and the Barley area has diminished in like proportion. Only Oats have increased, and they have done so by about 1,000,000 acres, roughly speaking. More easily cultivated, and less liable to damage, and more available for stock foods, Oats have carried the day. Yet, with all this lessened work on the farms, with increased mechanical appliances, labour is dearer, more scarce, and worse than it has ever been known.

These twenty-four years have seen much real steady progress made in the dairy farm industry. Not now an adjunct to mixed farming, it is generally conducted as a separate business; and where business habits have been brought to bear, where intelligent breeding of stock for milking purposes is thoroughly understood, the dairy farmer has been enabled to keep his head above water. But it is not every man who is qualified to take up dairy farming; it is a truly complex business, and one demanding the very best qualities and shrewdest abilities.

Many of us are still in the throes of harvest, and how it will end we know not. All we can say with any certainty is this: That harvest expenses are mounting up day by day, and we have no power to lessen them. The weather that adds to the expense also takes away from the value of the crop, and this is a problem in arithmetic that does not take much working out; i.e., loss of a serious nature to the farmer. So far our root crops look well, with, perhaps, the exception of Mangolds, which thoroughly appreciate warm moisture. We fancy our brethren with many acres of Potatoes will be trembling in their shoes, the only thing in their favour being the drying winds which alternately come and go, lowering the temperature. Mushroom weather favours the growth of other fungi beside the delightful edible variety. There is another bright spot, the small rise in the value of home-grown wools, and those men who have by means of their healthier banking accounts been holding on for the last few seasons will now be able to have a nice sum of money in hand. Mind, we are still of opinion that storing wool is not desirable, yet in the face of such shocking bad prices there is much inducement to do so, rightly or wrongly.

There is a certain religious service in which the participants are told to speak at once or for ever to hold their peace. Are we not now on the verge of a crisis? Mr. Micawber would say so, and we think it is now time we spoke, and that with no uncertain voice. Since 1846 we have been Free Traders, with the rest of civilised nations

against us. Since 1846 we have passed through more than half a century, a period that has seen more change and development in the conditions of life than any previous period in the world's history. All other methods of procedure existing in 1846 are now practically obsolete and antique, and not adapted to modern day requirements; and yet in this single instance we stand still, and what ought to be and what used to be our chief industry is crippled and disabled. It is all very well to talk of the growth of manufactures. Manufactures cannot exist without the artisan, and the artisan cannot exist without food; and we as a nation are year by year steadily declining in our food producing, trusting more to outside help than we have any business to do. No other nation is so blindly foolish as we. We receive far more than we send out, and our credit balance does not exist. We do not deny that more food might, and should, be produced within the limits of our shores; but there is no encouragement to do so. A rise of 10s. per quarter for Wheat would do more to bring back into cultivation derelict land than the sound of war's alarm, come it ever so nigh, and would also be a stimulus to more intense cultivation. Ten, or even fifteen shillings per quarter would not make a dear loaf, and a cheap loaf is a poor thing if it spells ruin to produce it.

We hear ominous rumours; a general election cannot be far off. We shall have pleasant gentlemen tearing through country lanes in their motors, anxiously soliciting our vote and interest. It is not war this time in foreign lands; it is a question of our own existence. And we think we shall be justified in according to no candidate our support who does not pledge himself to consider the agricultural situation and bring our commodities under the sheltering wing of Protection. One single protestor can do nothing; we must be prepared at this juncture to sink all party feeling, to band ourselves together as one man throughout the length and breadth of the country to go for Protection, and not be led off the scent by any side issue.

### Work on the Home Farm.

We have had a very trying time lately, but have managed to get the greater part of our corn cut and stooked up. With no more reaping requiring immediate attention we had meant to have three full days at leading. The influence of a fine day and brisk wind had put Wheat into good condition, but everything is drenched this morning, and the men are in the granary mending sacks, except the horsemen, who are leading manure on to seeds. Wheat generally is good where there is no bunt, but every day we hear new complaints of its prevalence. Barleys have not stooked up as heavy as we had expected, but all the earlier sown crops are of good colour, and if soon stacked will make fine malt. Those not yet cut are losing colour with every shower.

We hear of a motor binder at work a few miles away, but have had no opportunity to go and see it. If we can plough and reap without horses we shall soon do everything by motor. It will be a bad day for the Oat trade. The recent imports of hay and fodder were but forty per cent. of those for the corresponding period of 1902. Yet the trade here is absolutely stagnant, even at low prices. Surely the influence of the motor invasion is already felt. There is a poor prospect before hay growers.

The broken harvest weather has given opportunities for sending off small consignments of Potatoes, chiefly British Queen. They are good crops and of good shape and quality, but decided signs of disease appear. Several fields of Dates are beginning to show brown patches, and there is a good deal of disease in the gardens.

The lambs are folded on Cabbage, and doing very well, but some of our neighbours are not so fortunate. One farmer is running his lambs on uncleared Barley stubbles, with a couple of boys to keep them off the stooks as much as possible. They get a good deal of wholesome picking, especially on the hedges where there are Brambles. There is nothing better for them than Bramble leaves. A day's driving along the lanes will often do wonders to sickly lambs. Where large numbers are kept an excellent course is to have all the sickly or weak ones in a flock by themselves; and specially nursed like human beings in an infirmary.

### Using a Gun on a Motor Car.

One of the leading farmers in East Lothian, during the last few weeks, has had as a neighbour a Londoner, who drives a motor car. They repeatedly met on the road, and the farmer to protect his horses, held up his hand as a signal to the motorist, who, however, paid no attention, and drove his car at full speed. His signals having been several times disregarded in this way, the farmer became incensed, and on the next occasion of their meeting he burst the tyres of the motor car by firing the contents of a rifle into them. The owner of the car is endeavouring to get the police to take the matter up.

# PLANTING SEASON

## PAULS' ROYAL NURSERIES

WALTHAM CROSS, HERTS.

12 miles from London. South Entrance four minutes' walk from Waltham Cross Station; West Entrance three minutes' walk from Theobald's Grove; both Stations on the Great Eastern Railway.

### SPECIALITIES:

**ROSES** in all forms, from open-ground and in pots. Gold Medals in 1903 from Royal Horticultural and Royal Botanic Societies.

**FRUIT TREES** for the Orchard, Garden, and Forcing House. Hogg Memorial Medal, 1901.

**HARDY TREES** for Streets, Parks, and General Planting. Silver Medal from Royal Agricultural Society of England.

**SHRUBS**, both Evergreen and Deciduous.

**CLIMBING PLANTS**, Hardy and Greenhouse.

**RHODODENDRONS, CAMELLIAS, & AZALEAS.**

**HERBACEOUS PLANTS** in great variety.

**BULBS and SEEDS**, and all Garden Sundries.

PRICE LISTS ON APPLICATION. INSPECTION INVITED. Upwards of 1000 Medals, Prizes, and other Awards at leading Exhibitions during the past 42 years.

SOLE POSTAL ADDRESS—

## WM. PAUL & SON,

WALTHAM CROSS, HERTS.

Rose Growers by Appointment to His Majesty the King.

### R. D. Blackmore's PEACH—"LIBRA."

AWARD OF MERIT R.H.S.

Late mid-season; very large and heavy; average width 3 1/2 in., height 4 in., weight 10—11 oz. Apex depressed; lobes unequal; suture shallow. Skin of a beautiful rich creamy colour, daintily flushed with crimson. Fine melting flesh, which separates freely from the stone; rich brisk flavour, and very juicy. Of the Seedling Peaches raised by the late Mr. R. D. Blackmore this is the one he selected for distribution to his fellow fruit-growers. It has already proved itself of great value to follow the earlier and smaller varieties under glass. As soon as it becomes known it will be indispensable to market-men on account of its size, high quality, and its crimson and cream coloured skin, which is very distinct, and produces a goodly appearance.

Large trained Trees, with well-ripened fruiting wood, 31/6. Maidens, 21/-. Direct only from—

**Will Tayer, Hampton, Middlesex.**

THURSDAY, SEPTEMBER 17, 1903.

### Pear Trees on Gable-ends.

**W**ALLS, often costly ones, are built specially for fruit trees; but they are not always attended with the best results, while the warm, dry walls of both domicile and out-buildings are often better calculated for the culture of the trees than the garden walls. In this respect no more suitable

position than a gable end is adapted for the cultivation of, more especially, the vigorous varieties of Pears, requiring, as they do, ample space for their successful development. If properly selected varieties are grown, they will yield a profitable supply of useful fruits. The gable walls of houses, or other buildings, also possess an advantage over ordinary walls, in the fact that no danger of drippings from the roof occurs, which obtains from walls unprovided with spouting or gables. And oftener than not it happens that the chimney-flue of the kitchen or daily residing room runs up the gable end, thus affording an economical provision for the maturer ripening of the wood. Moreover, the warmth is a protective against frost, and the fruits ripen early, especially those immediately in proximity to the direction of the flue; this also prolongs the duration of the crop.

Beyond this, what is handsomer than a fruit tree, the Pear especially, whether in leaf, flower, or fruit, against the gable wall of a villa, cottage, farm buildings, stable, coach house? The triangular form of the gables will naturally equalise, especially the espaliers, which are proposed to be trained against them.

Any other form, however, would be suitable, excepting in the case of naturally strong growing varieties of Pears, and it is to the Pear that we more particularly allude. The horizontal form of espalier specially lends

**R**EADERS are requested to send notices of Gardening Appointments or Notes of Horticultural Interest, intimations of Meetings, Queries, and all Articles for Publication, officially to "THE EDITOR," at 12, Mitre Court Chambers, Fleet Street, London, E.C., and to no other person and to no other address.

itself to equalising the growth of the branches, and affording a style of contour in agreeable harmony with the geometrical plane of the gable wall.

Uvedale's St. Germain Pear is an exceedingly vigorous sort, and produces enormous fruits, almost like Swede Turnips. A specimen I have in my mind's eye is growing against one of the four gable ends of the commodious stables at Weston House, Shipston-on-Stour, in South Warwickshire, the splendid seat of the Earl of Camperdown. The tree must be more than an octogenarian, inasmuch as upwards of half a century ago the writer recollects that it was then almost, if not quite, as large as at the present time. Nevertheless, good crops of fine fruit have been annually borne, and I have a vivid recollection that in my aspiring early "teens" I was privileged by my father to "try my prentice hand" on fruit tree pruning and training by commencing upon the veteran in question.

The gable has a southern aspect, which no doubt materially contributes to the fertility of the tree. Mr. John Masterson, the competent gardener at Weston House, courteously gave me a photograph of the tree, which the *Journal of Horticulture* reproduced in 1902. The total weight of the crop of fine fruits (some of them nearly 2lb each in weight) was at that time 2cwt. Many first prizes have been won from the tree, including first at the Crystal Palace Show in 1894 and 1895. The tree has never been fed with stimulants, nor has it been root-pruned, and its roots are in the bed of a wide carriage drive leading to the back premises of the mansion. Gravel encircles the base of the stem, where it measures 6ft in circumference. Doubtless the roots have rambled a considerable distance, and also come in contact with the stable drains, thus deriving the nourishment required by so large a tree.

The principal front of the stables, facing east, was formerly furnished with fine old fan and espalier shaped Pear trees, now supplanted by a mantle of *Pyracanthas* and *Ivies*, planted some twenty years ago. The kitchen garden walls at Weston House are also furnished with many fine old Pear trees. Fig trees used to bear very good crops of fruit at Weston, and a long wall is furnished with them. Another long and high wall, leading into the kitchen garden on the far side of the stables' chief front, was formerly clad with Figs, but is now appropriated to Apricots.

Amongst the numerous instances of notable gable end fruit trees, one of the most remarkable recently subject to the notice of the writer was a fine specimen of a tall tree of Marie Louise Pear, growing against the high gable end of one of the garden offices at Elvaston Castle. The tree is about 34ft high, and was laden with fruit, and was also at the time the heaviest laden Pear tree in the gardens there.

In the choice of varieties suitable for gable ends or similar spacious walls, the grower must be controlled in a great measure by the aspect; but in nearly every case they should be vigorous growing varieties grafted on tall, free stocks. The latter proviso, however, is not essentially necessary, excepting that a tall stem affords a better means of regulating the growth of the branches, and also by allowing the basal ones to be trained in a downward direction, and thus furnish the lower portion of the wall with fruit bearing shoots, not so readily available by the fan system.

One of the most suitable varieties for a north aspect is the prolific *Beurré d'Amanlis*, which, being a vigorous grower, would soon fill the allotted space. *Williams' Bon Chrétien* also is a suitable variety for the aspect indicated, and whereby a longer succession of this popular Pear may be acquired. For a western aspect *Louise Bonne* of Jersey is one of the best, and *Pitmaston Duchess*, also its prototype *Duchesse d'Angoulême*, which is well adapted for an eastern aspect. Of course, there are several other varieties suitable for the different aspects (for a south aspect *Passe Colmar* may be mentioned), but I have named the best of the several varieties adapted for this position.—W. GARDINER.

#### Crown Imperials.

This is *Fritillaria imperialis*, a hardy bulbous plant which does well in a shady border, in deep, rich, rather adhesive soil. The flowers are drooping and bell-shaped. The bulbs may be planted now 4in to 6in deep, in groups of three or four. They will need no further attention for several years, with the exception of an annual top-dressing of decayed manure.—S.

## Edible Fungi.

Said a visitor to me in the Drill Hall on Tuesday: "What are they doing with these things here?" We were looking at Dr. Cooke's coloured drawings of twenty edible Fungi, and in a few words I told the man. I said Dr. Cooke wants us to study these, and use them for food, and he has described them to us. Before the man left me (he grows Orchids) he asked, "And where is the one that is poisonous?" Such simplicity, alas! is too common amongst us.

But that there are large numbers of men and women at work studying Fungus growths—certainly with various objects in view—the meeting convened last Tuesday in the James Street Drill Hall, Westminster, gave ample proof: they were there with notebooks, handling, smelling, examining the species in the numerous collections. Moreover, there has been no such crowded audience in the Drill Hall for months.

Dr. Cooke (the record of whose surprisingly varied life from solicitor's clerk to Board teacher and botanist, in England and America, we gave in 1902) began his remarks by stating that he meant to be popular, rather than severely scientific, in the treatment of his subject. There are four chief groups of edible Fungi, *Agarics*, *Morels*, *Truffles* and *Puff Balls*. Briefly tracing the life history of a type plant (the common Mushroom, *Agaricus campestris*), he then quickly ran through the following list, pointing out the prominent characters, and gave some facts of their history, properties, and commercial or domestic importance. Thus—

*Agaricus campestris*; *A. c. sylvicola*; *A. villaticus*, the Giant Mushroom; *A. elvensis*, Scaly Mushroom; *A. arvensis*, or Horse Mushroom; *A. hæmorrhoidarius*, the Bleeding Mushroom.

*Tricholoma gambosa*, St. George's Mushroom; *T. personata*, or Blewits; *T. nuda*, or Blue Caps.

*Clitocybe nebularis*, the Dusky Caps; *Lepiota procera*, the Parasol Mushroom; *Coprinus comatus*, Shaggy Caps; *Cantharellus cibarius*, the Chantarelle; *Marasmius oreades*, the Fairy-ring Champignon.

*Boletus edulis*, the Edible Boletus; *B. scaber*, the Rough-legged Boletus; *Morchella* sp. (Morels); *Helvella lacunosa*, the Dusky Helvella; *Lycoperdon bovista*, the Giant Puff Ball.

All the drawings were by Dr. Cooke himself.

"If the mystery of cultivating edible Fungi," said Dr. Cooke, "could be discovered, we should be able to cultivate many species." He himself has eaten eighty species, all more or less wholesome. The cultivated Mushroom (*Agaricus campestris*) is a most widely spread species. It is found in Siberia, Northern India, Mongolia, Ceylon, North and South America, South Africa, Oceania, Tasmania, and everywhere, indeed, if a suitable climate exists. It is recognised as good for food in a number of countries. The Chinese, he remarked, cultivate a number of species of Fungi, but it is not known whether this is included.

The common Mushroom is subject to considerable variation, and numbers of well-marked forms are known to experts. One of the best known is *A. c. elvensis*, well known in Italy. Another is *A. c. sylvicola*, commonly found in our own woods, and has a white cap or pileus, smooth like a glove.

The lecturer emphasised the strong need to cook *Agarici* as soon as possible after they are gathered. "In the morning, with the dew still upon them," is the best time; and he further stated that many cooks did not know how to properly preserve their goodness; in short, how to cook them. A reverend gentleman, at the end of the address, said that he had tasted all the kinds of edible Fungi Dr. Cooke had mentioned, and he thought it hardly safe to eat some of them. The Puff Ball, for instance, in the cooking gave off powerful fumes. The essayist again reiterated his plea for cooking while the samples were perfectly fresh. True, many stomachs are highly sensitive; he had even known a person the skin of whose hands became inflamed by handling the cultivated Mushroom; and he went on to observe that the chemical ingredients of the Fungi change on undue exposure to the air, making them deleterious if the change is carried far enough. Some folks thought that all edible *Agarics* and edible genera generally, had a flavour akin to that of *Agaricus campestris*, and that this was one means of identification. Dr. Cooke, on the other hand, stated this to be unreliable, as many species have decidedly distinctive flavours. There is no Royal road to a knowledge of good and bad, poisonous and non-poisonous kinds: they must simply be studied, until one gets to know them.

Numerous enquiries were heard for a good text-book, in order to learn something more of so fascinating a subject. Students in reach of London can get a List at the Natural History Museum, Cromwell Road, South Kensington. The Society for the Promotion of Christian Knowledge, London, publish coloured plates of life-sized specimens, mounted on cloth, price one shilling each.

(To be continued.)

### Cypripedium × Constance.

This is one of a trio of hybrids raised by Mr. Drewett, Riding Mill-on-Tyne, in 1890, and comes from *C. Stonci* × *C. Curtisii*. The dorsal sepal is white with purplish streaks, the petals are 3½ in long, pale yellow, with brownish purple dots, and a few marginal hairs. The lip resembles *C. Stonci* in shape and colour. The hybrid is possessed of free flowering qualities. The illustration is interesting as showing what may be expected from the hybridising of these two well-known species.

### The Week's Cultural Notes.

In autumn there would appear to the uninitiated very little to do in the Orchid houses, and although this is to a certain extent true, it is an anxious time to the careful cultivator, who likes to get the best possible results. There are so many species under his eye, and they need such varying treatment. He will be noting the backward state, say, of *Cattleya Mossiae*, and know that it wants rushing on to a finish as soon as possible; or, *C. Bowringiana*, repotted recently and throwing out its roots, will be in need of extra warmth. Yet, in the same house are others of the spring flowering type that must be kept dormant.

The best positions where light and heat are most plentiful will, of course, be set apart for the former class of plant, and in some cases a little extra fire heat will be turned on; but with this, as with other details, much circumspection is needed. The same with watering. No overhead moistening can be permitted from now onwards, and even at the root of most species the supply will be considerably curtailed. Damping the floors and stages must go on, but it will not be so frequently necessary, as the external conditions are not so dry, and the atmospheric moisture leaves the house more slowly. But Orchids are more easily overwatered at the root than in the atmosphere.

Especially is this the case now with *Phalænopsis*, root action being often checked instead of facilitated by pouring water about the compost. Among *Vandas*, *V. cærulea* and *V. Sanderiana* are producing flower spikes, and both should be kept moist as yet. But the temperature required is quite different, the former liking ample heat, while the blue flowered species does better in a cool intermediate house. *Saccolabiums* of the *Blumei* and *retusum* section need a drier atmosphere now, as do also *Ærides*, *Angræcums*, and the taller growing *Vandas*.

Light, in its effect upon Orchids, is not always sufficiently thought of by amateur growers, or the glass would be kept cleaner. Now that the days are shortening, the cleansing becomes doubly important, and a lull in the routine work allows of a thorough job being made of it. Only a small portion of a house can be taken in hand at a time, as it is not well to crowd up the plants at one end while the cleaning is in progress. Having removed the plant, thoroughly moisten the roof, glass and woodwork, with warm water; then scrub all the paint work thoroughly with softsoapy water and paraffin, sponge the glass inside and mop the outside. A coating of limewash to the inside walls is of benefit, and the material used on the stages should be turned and sifted. —H. R. R.

## Lifting Plants from the Open Ground.

The plan of planting out subjects for the summer season to be lifted and potted for the greenhouse has many points to recommend it. The work entails some labour at this season because the plants, to succeed, must be established before frost comes, and placed safely under glass.

To achieve the best results, the planting-out should be done in the first instance with a view to lifting and potting in the autumn, hence the situation selected will be open and exposed to sun and air. This will induce a stocky growth. Plants which readily lift are *Chrysanthemums*, *Salvia splendens*, *Richardias*, *Eupatoriums*, *Solanums*, *Bouvardias*, *Heliotropes*, and *Lobelias*.

The best *Chrysanthemums* for lifting and potting are the dwarf habited early Japanese, pompons, and late varieties. If grown two feet apart on good soil they have plenty of room. About a fortnight before lifting (which may be done when the buds show) run a spade all round each plant at half a foot from the stem, and follow with a watering. Prepare a number of 7, 8, and 9 inch pots with proper drainage, and have them in readiness. When lifting, reduce the ball of soil and roots, giving as small a

pot as possible. Drop the ball in about half-way; then, with a little dexterous jarring of the bottom edge of the pot on a firm base of soil or wood, the ball of roots may be worked down in position.

Give a thorough watering to moisten the whole mass, and stand the pots in the shade until established. Lightly syringing every day will materially help in this. Bring the plants to a sunny position as soon as possible. With judicious watering and treatment, little foliage will be lost, and the buds will swell and develop. As they do so assist them with some weak manure water, and stand the plants in cool, airy house.

Precisely similar treatment should be accorded to *Salvias*. *Salvia splendens* is usually in bloom when so lifted and potted. As soon as the plants show signs of having taken root hold transfer under glass and see that they do not suffer from lack of water at the root. A position under glass, where a little heat and plenty of light is available, will ensure these plants remaining attractive for a considerable time. By affording a stove temperature after the first blooming is past more growth and flowers will follow.

Cypripedium × Constance.

*Richardias* planted out in summer die down eventually, but spring up with fresh growth from the crowns, and produce vigorous stems and large leaves. Some of the strongest will throw up spathes while still in the open ground, but those which do not, the lifting and potting serve to check them, and induce them to do so later.

After potting, place the pots on a hard base, in this case in the full sun, and give a copious soaking of water. Let them remain out until the approach of frost, but house them in time, as they are very susceptible to light frosts, and are much injured if caught.

*Eupatoriums*, *Solanums*, *Bouvardias*, and *Heliotropes* may be lifted without preliminary treatment in the matter of cutting the roots. They are usually well furnished with fibrous roots, as many as possible of which should be retained, and long, bare roots shortened back, placing all in as small pots as can consistently be done. Give cool frame treatment at first, and eventually house treatment.

*Lobelias* really come under the category of bedding plants, many of which are lifted and potted to provide stock. *Lobelias* should be cut down: that is, the flowering stems ought to be removed, and when short, young growths have been produced the clumps may be lifted and potted, wintering on a shelf in greenhouse.—E. D. S.

### American Roses.

That America keeps forging ahead of us in a good many matters it would be useless to deny: and it must be a question of interest to rosarians to know what varieties are most popular and most largely grown in the United States. We are accustomed to think that these are naturally different from our favourites, because of the severity of the winter, which prevents any but the hardiest being grown entirely out of doors, but in some of the western States the climate approximates more nearly to our own, and all varieties except, perhaps, the tenderest of the Teas, are grown to perfection there.

I have lately received a pamphlet, and also a gardening paper from America, and the advertisements of Rose plants in the latter have much interested me. About eight or ten varieties only are mentioned in thirty or forty advertisements, and I am not sure that an English gardener would recognise "Beauties, Brides, Gates, Maids, Ivory, Perles, Meteors, and Woottons," but our friends across the water have a most praiseworthy way (to my mind) of cutting down long titles, and I shall be glad to see them operate on the names of some of our newest Roses, especially those "made in Germany."

The advertisements, no doubt, relate almost, if not entirely, to "stuff" for growing under glass, and it is noticeable that a full half are varieties originally raised in America. "Beauty" is American Beauty, very highly esteemed, and grown, perhaps, in larger quantities than any other Rose. The variety was known here as *Mad. Ferdinand Jamain*: I forget the raiser and the date, but I think it has been practically dead to English catalogues for ten years at least. Somebody, I believe, tried to re-introduce it as American Beauty, but it failed to find any appreciation. One secret of its popularity in America lies in the possibility of cutting the blooms with quite long stems; and here I do not hesitate to say we are behind-hand.

I have often urged on my friends in the trade who sell cut blooms in quantity in our cities that, without giving up their present manner of cutting, they might add to it another grade of "long-stemmed" Roses, of a foot to eighteen inches, at a higher price. I have the firmest belief that, when once ladies, town florists, &c., have tried these and found their great superiority for decoration, there will be a large demand for them at a remunerative price. The answer I generally get is that Americans can cut with long stems, because they cut away and do away with the whole plants, raised in great quantities in small pots under glass, while English nurserymen, cutting from maiden plants in the open, would check their plants and render them less valuable for sale. I still think it might be done with Ulrich Brunner and other strong-growing varieties, either by cutting not more than one or two blooms with long stems from each plant, or growing a certain breadth on purpose, for I believe the price obtained might be nearly, if not quite, doubled.

And I really believe the other secret of the popularity of American Beauty lies simply in the name, the title of which seems at least doubtful. Our excellent cousins across the water take it for granted, perhaps, that they do so in *all*, and that there can be no crimson Rose to compare with American Beauty. But, in a pamphlet I have received from an amateur grower in a western State, the acknowledgment is made that long stems have not succeeded in making American Beauty beautiful, but merely fashionable. He has the courage of his opinions, and declares that American Beauties are born with that tired look that Ulrich Brunner does not show till after three or four days' exposure to a hot sun.

"Brides" are, of course, "The Bride," a sport of Catherine Mermet originating in the States; and "Maids," are Bridesmaids, another American sport of the same Rose. "Gates" are Golden Gates, a Tea Rose raised in the States; and "Ivory," a light sport of the same. "Perles," *Perles des Jardins*, of good colour under glass; "Woottons," *Souvenir de Wootton*, a good crimson Rose for early forcing. Of "Meteor" I remember the name, but nothing more.

The Rose plants in these advertisements seem very cheap—about 10s. a hundred seems a common price; but then, I take it, they are not meant as lasting plants, and are thrown away as soon as the blooms with long stems have been cut from them.

Reverting to the name American Beauty, I do not think the Americans have much scruple about changing names. I see that Gruss an Teplitz has been re-named Virginia R. Coxe, and we know that the change has not always been for the better, as to simplicity and ease in spelling, as was seen in the re-christening of Mrs. W. J. Grant as Belle Siebrecht.

My correspondent in the West sent me a photograph of "Fortune's Double Yellow" growing on his house, a literal mass of

bloom, which puzzled me a bit. I know Fortune's Yellow, and a beautiful Rose it is, and a free bloomer very early on a south sheltered wall; but I never heard the term "double" applied to it, and the photo did not seem quite to correspond to our Fortune's Yellow. Still, I think, in spite of the following quotations—"Fortune's Double, white and yellow, literally cover porch and wall," and "The Banksia climber, Fortune's Double Yellow, is known in California as the 'San Rafael Rose'"—(which sound as if referring to the yellow Banksia) that our Fortune's Yellow is meant, after all. Does anyone know?—W. R. RAILLEM.

### Rose, Gruss an Teplitz.

In my notes on Roses in the Journal a short time since I spoke favourably of this Rose. Since then I have had a further opportunity of appreciating its great value. In Lord Battersea's charming garden near Cromer is the finest exposition of this Rose that I have come across. At the front of a shrubbery margined by the lawn, and with a southerly exposure and facing the mansion, a group of not less than two dozen plants of this Rose were planted last autumn. In the sandy soil here this Rose has made growths this season fully 6ft high and clothed with such foliage as I have not seen before on any Rose—that dense, deep green with a leathery look so pleasant to look upon.

As might be expected, each sucker-like shoot is surmounted with a cluster of a dozen or more of those velvety red-hued blossoms which are so remarkable in this Rose, and of that size and lustre so enchanting in this Rose. Mildew on this Rose was conspicuous by its entire absence, although this variety is addicted to this pest considerably, in the southern counties especially. Hard pruning was practised. The growths were cut back to within a single eye, which no doubt accounted for so much vigour. In the distance this group gave one the impression of finely flowered and brilliantly coloured Cactus Dahlias.—E. M.

### Irish Prospects.

As the brightness and bustle pertaining to the International motor race and Royal visit abate, economic factors ruling an agricultural country force themselves to the front, and the outlook, to say the least, is not cheerful. It cannot, indeed, be regarded as other than serious, and although the shortcomings of the season are not yet fully revealed, a sickening odour of rotting Potatoes and musty hay, with the miserable appearance of the corn crops are present effects of a rapidly passing year, affording but poor promise for the near future when the full tale of its misdeeds is told. Even those most concerned do not at present seem to fully realise what it must mean to them in particular and the country in general. True, there has been much, and is something still, to distract attention which at present seems more centred on the American cup than on those desultory Press reports of the crops which take but a second place in the papers. However, sufficient for the day.

Gardening, perforce, should rank first in these notes, and of other things hereafter. Fruit bearers are, practically, barren, with, of course, local exceptions. This in allusion to the staple kinds, viz., Apples and Pears. Possibly the same ruled, generally, with small fruits, for Strawberries appeared to be but wretchedly represented in Dublin during the season, and bruised berries waited in the shop windows for buyers at 1s. per pound. Personal experience can only report that never was there a stronger promise nor a weaker performance, the finer fruits rotting on the ground ere colouring; but with Gooseberries the bushes were simply weighted down, and made a record so far as the same personal experience is concerned. As for Plums, non est sums up their achievement, and virtually includes all else in the fruit department.

Vagaries in vegetable culture are more plentiful than usually falls to the lot of those who cater for the kitchen. It is pleasanter to look back than it is to look forward, for Peas, which play so prominent a part in the menu, were highly satisfactory. French Beans, after many days, at last came into bearing, although but lately they appeared likely to land us in the same fix that gardeners in some part of Scotland experience, viz., a "wee taste of frost" to settle them ere any other tasting obtained, but the succulent Marrow, not much appreciated in Ireland, is well in evidence. Apropos of that and cottage gardening in the Green Isle, which yet, unfortunately, is all but conspicuous by its absence, there is, undoubtedly, a prejudice among the peasantry against the Vegetable Marrow, which, too, permeates the servants' hall in higher places, the Celtic Jeames de la Pluche pinning his faith to "white Cabbage" as his sole vegetable all the year round; Potatoes here being no more regarded as a vegetable than is bread, which has been already duly recorded in these pages by observant visitors to Erin. Nevertheless, notes from the garden must include the "noble tuber."

A breadth of Sharpe's Victor, which gave a splendid crop when turned out early in August, showed but small trace of disease. These were stored in hampers holding about 2cwt each, and placed in a dark, dry, well-ventilated shed for present use. We felt rather happy about them, for here was something to hand whatever might happen to later lots. Alas! for the sequel. Fully 50 per cent. went bad in the hampers. As for later lots, still in the ground, with reputed disease resisting sorts amongst them, judging by the burnt up haulm, sound tubers are not in it, in spite of heavy sprayings of orthodox mixtures. "Dig 'em, of course, at once." Exactly so. We are just waiting for a dry day to do it, and in saying that all is said that need be said about the present state of Irish weather.

Looking ahead through a literal Scotch mist, which, in its continuity, ought to have suited those crops intended for winter and spring supplies, the fact is apparent that it has not done so. Celery, Broccoli, and others of that ilk, are making but miserable growth; but, and it is worth noting, for the first time in six years the periodical plague of flies came not, and Onions and Turnips have escaped their kindly attentions. Wasps, too, until but recently, were missing. When they did come they meant business by promptly attacking the Grapes—Black Hamburgs—which were as promptly bagged in stiff muslin. The tough-hided Colmans and Alicantes being untoothsome to the Vespa family escape. Bags are a necessary nuisance, undoubtedly; one never knows what is going on inside, and with Hamburgs fully ripe a bad berry makes heaps of mischief, so when the bag is opened hard words are apt to come out.

Less perversity and more comfort, perhaps, is derived from thoughts among the flowers. Never were Sweet Peas finer or more persistent in blooming, being still as big and bright as ever, though somewhat skimpier of stem. They were planted in heavily manured trenches, being previously raised under glass, in pots, a few seeds in each pot, and then transferred to the trenches, each potful placed a foot apart. Sixteen of the brightest selfs were selected from the seed list, and it is just a question now whether six kinds will not be sufficient for next year, as the best reds, whites, and blues are most appreciated for cutting. Red, white, and blue were our company colours during the King's visit to Dublin, and patriotic fingers picked out the brightest for loyal effect, which, with natural grasses and a few light sprays of Asparagus (they just escaped being "gypsophilised"), left nothing to be desired. Six kinds only for the seed list next season! Unless weakness yields to temptation: Two blues, two bright reds, two clear whites. For the first couple, Lady Grizel Hamilton and Captain of the Blues; reds, Prince of Wales and Salopian; whites, Emily Henderson and—and, probably, Emily Henderson again, these varieties for vigour and all round goodness standing out pre-eminent, here at least. Opinions may differ, but allowance must be made for local circumstances, which alter cases.

Mildew is rife among the Roses, and autumn blooms are nothing to brag about. One H.P., however, grown in quantity, stands out far and away above the fellows of its tribe in its clean, broad, glossy foliage and perfect autumnal blooms, which rival in quality, and almost in quantity, its summer display. Dare one mention its name, having praised it so often before? It is, of course, Ulrich Brunner, still sending up growths like walking stieks after being planted six years. La France is equally as good in its own way, and more floriferous. So with the charming species, *hermosa*; but, alas! for the refined and elegant Mrs. W. J. Grant, which is fast dying out.

So one might go on, speaking of joys and disappointments, the balance, probably in favour of the former so far as the flowers are concerned, for, somehow, we unconsciously turn to them for comfort, and perhaps it was never more needed, or more easily found than now amongst the bright autumn bravery of Tritomas, Cactus, and single Dahlias, with the insinuating blue of *Erigeron speciosum*; the mingling odours wafted from modest *Mignonette*, luscious *Heliotrope*, and all the odds and ends of beauty and interest which go to make our kitchen garden a thing of beauty. The flower garden proper, with its bedding, is simply "not in it."

However, it has its own peculiar right of being, and has to be, on our terraced front; and it must be noted, too, that the bedders, except Begonias, have behaved badly. Geraniums, dying out in patches under the affliction of "black spot." One feels better, however, on hearing from the Gunnersbury boys (again home for a holiday), "it's the same around London, only worse."

"Back to the land"—momentarily; and to the seamy side of soil production in Ireland—

"Are Italy's fields more green,  
Do they team with a richer store,  
Than the bright green breast of this Isle of the West,  
And its will luxuriant shore?"

No, emphatically no, so far as greenness is concerned, for there is a plethora of grass and uninterrupted growth on the great grazing grounds of Dublin, Kildare, and Meath. Beyond that there is but little to add to what has been said of the disastrous condition of the corn and Potato crop, except that as regards the

latter spraying with antiblights has been, practically, valueless this year owing to the continuous washing off by rain.

Possibly there is a lesson in this pointing to the necessity of some adhesive being employed with the ordinary solutions of copper and lime. Spraying is not an easy task, and it is not only a question of whether our easy-going people after the second application—they seldom reach that, it is feared—would persist any further with the preventive, but whether anybody else would, and if they did, the ultimate result of introducing an appreciable quantity of such highly poisonous matter to the soil. A recent run by rail to Skerries, on the north-east coast of our country, revealed much that was pitiful to see in the breadths of Oats and

*Vitis Thomsoni*,  $\frac{1}{8}$ -size of nature.

Barley flattened to the ground, and unless this month of September goes on better than it began, it will take a lot more motor-ing, Royal visiting, and Liptonian yacht racing to cheer up Ireland in the opinion of—K., Dublin.

#### *Vitis Thomsoni*.

This new species, which we figure on this page, is one of those sent home from Central China by Messrs. J. Veitch and Sons' collector (who is out there now), and, along with five others, received certificates when staged in the James Street Drill Hall before the Royal Horticultural Society, on September 1st. It received a First Class Certificate. We have already described the plant (see page 247), and the reduced drawing will further serve to elucidate the subject. The leaves are reddish above, and violet purple beneath. The stalks are about five inches long. As it climbs, and clings by its own tendrils, the newcomer is a valuable (hardy) acquisition.

# NOTES & NOTICES

## Wasp and Bee Stings.

The sting of either a wasp or a bee is instantly cured by touching the spot affected with tincture of iodine. Fond mothers are occasionally in the habit of applying the "blue-bag," in which of course iodine forms an element. Dry earth has also been recommended.

## National Dahlia Society.

By permission of the Royal Horticultural Society an inspection by our committee of the Cactus Dahlias grown for trial at Chiswick will be held at Chiswick Gardens on September 17, at 2 p.m. A prize of 10s. 6d., the gift of Mr. A. Dean, will be awarded to the raiser of the best variety for garden decoration.—P. W. TULLOCH, Hon. Secretary.

## Colours of Cactus Dahlias.

Dahlias are now at their very best. The Cactus varieties have all sprung from the Mexican species (*D. Juarezi*), introduced to this country in 1878. It appears inconceivable that a crimson flower should, in the hands of the florists, have come to develop a large range of colours, ranging from pure white to almost black, and also combinations of colours. Some are weird, some fascinating, some approach the grotesque; but all are attractive in their way.

## Royal Caledonian Horticultural Society.

At a meeting of the council of this society, held on Saturday, 12th inst., it was unanimously resolved to at once set about preparations for the holding of an International Fruit and Flower Show in Edinburgh under the auspices of this society in September, 1905. The last international show held by this society was in 1891, and proved a great success. Looking to the strides which horticulture has taken in recent years, both at home and abroad, the council anticipate a greater success, and they are desirous to offer premiums even better than in 1891, the total sum then offered being £1,300. The secretary is P. Murray Thomson, S.S.C., 5, York Place, Edinburgh.

## National Chrysanthemum Society.

The first meeting of the Floral Committee of the above society will be held on Monday, the 21st inst., at 3 p.m. in Essex Hall, Essex Street, Strand. This is the first of three meetings arranged to be held in Essex Hall, the succeeding two being on October 26 and November 23, both at 3 p.m. The remainder of the meetings of the Floral Committee will take place at the Crystal Palace on the dates fixed for the three usual exhibitions, viz., October 6, November 10, and December 8. On these three occasions the meetings will take place at 1 p.m. The first meeting of the executive committee of the society will be held at 7 p.m. on the 21st inst., at the old business quarters of the society, Carr's Restaurant, 265, Strand.

## Essay Prize of £10.

The President and Council of the Royal Horticultural Society offer a prize of £10 for the best essay on "Cottage and Allotment Gardening." The essay must not exceed 5,000 words, and all unnecessary technical expressions should be avoided. Notice must be taken of vegetable, fruit, and flower cultivation. The essay must have as an appendix (not included in the 5,000 words) a list of reliable but inexpensive books on the subject which could be recommended to a cottager. The prize essay is to become the sole and absolute property of the Society. The essays must reach the Secretary of the Society, 117, Victoria Street, Westminster, S.W., before January 1, 1904. Each essay must be signed with a motto, and a sealed envelope must be enclosed, bearing the same motto on the outside and the writer's name and address inside. These envelopes will not be opened until the judges shall have decided on the motto winning the prize. If any illustrations are added they should be of the simplest and plainest outline description.—W. WILKS, Secretary, September 10, 1903.

## Mr. T. Humphreys.

On a recent date, Mr. T. Humphreys, assistant superintendent of the R.H.S. Gardens at Chiswick, was presented by the students and his fellow workers there, with a gold watch chain, as a token of their esteem, and in proof of their good wishes for his success as curator of the Birmingham Botanic Gardens, which post he shortly assumes.

## Sheffield Chrysanthemum Society.

The monthly general meeting of this society was held on Wednesday evening at the Westminster Hotel. Mr. J. G. Newsham was in the chair. Reference was made to the death of the late secretary, Mr. W. Housley, and a number of letters read from kindred societies and friends expressing their sorrow. A vote of sympathy and condolence with the widow and family was passed by the members present. Mr. H. Willford, 96, Greenhow Street, was elected secretary provisionally for the remainder of the year.

## United Horticultural Benefit and Provident Society.

The monthly committee meeting of this society was held at the Caledonian Hotel, Adelphi Terrace, Strand, on Monday evening last. Mr. Charles H. Curtis was in the chair. Four new members were elected, and four members were reported on the sick fund. The annual dinner will be held at the Holborn Restaurant, on Tuesday, October 27th next, at 6.30 p.m. Peter Barr, Esq., V.M.H., has kindly consented to preside on this occasion. The committee hope that all members and friends who can possibly attend will endeavour to do so.

## Presentation to Mr. J. Doe.

At the conclusion of the King's visit to Lord and Lady Savile, Rufford Abbey, Notts, His Majesty presented Mr. J. Doe, the head gardener, with a valuable diamond scarf pin, in the shape of the Royal monogram. At the same time His Majesty expressed to Mr. Doe the extreme pleasure he had derived from the gardens during his visit, and congratulated him on their condition. Mr. Doe has had charge of the Rufford Gardens for upwards of nine years, and has effected several improvements, and it must be very gratifying to be the recipient of so great an honour.

## Tritoma uvaria.

*Tritoma uvaria*, alias *Kniphofia aloides* (see page 263), Torch Lily, otherwise Red-hot Poker, is happily not a stranger. Beds of the Tritomas (to use the garden name) at this season furnish one of the finest features in ornamental gardening. They do well to eke out a thin bed of *Gladioli*, or even if the *Gladioli* are robust and plentiful, the Torch Lilies do not "clash," but are, in any case, a grand addition. But the very best combination the flower gardener can employ is Tritomas and *Galtonia* (or *Hyacinthus*) candidans—a priceless gem when properly associated. If you have not set aside a bed of these plants, please do so: you will admit the handsome effect and the excellent contrast. (In passing, one may allude to another fine contrast in "bedding," and that is: *Anemone japonica*, over bright blue *Violas*). The Torch Lilies like generous treatment, a deep, moist loam, and sometimes require a dressing or protection of half-decayed leaves over the crowns in winter. Do not cut away their own foliage: this assists the crown.

## The Gale at Cardiff.

The gale on Thursday last played havoc with the Chrysanthemums in several gardens in this district. In one garden, that of Mr. Geo. W. Drake, the well-known grower, dozens of plants were laid low and snapped off, whilst innumerable plants were quite stripped of their leaves, just as if a knife had been drawn over them. At one time during the late evening the force of the gale was so strong that the pots were actually blown off the boards on which they stood, and Mr. Drake was obliged to cut the ties of every one and place the pots flat on the ground. The damage and loss to this grower is very considerable. His plants, which numbered about 600 (*Japs* and *Incurveds*) looked remarkably well before the storm, and it is questionable whether they will recover to be of any use. On the whole, the plants in the neighbourhood, where they escaped the gale, are doing well, and the number of growers, especially cottagers, this year is more than doubled, and keen competition is expected at the November show.—G.

## Old Time Gardening.

(Continued from p. 94).

Bacon's princely garden and Lawson's country garden would in conjunction afford us a very incomplete notion of the condition of gardening had not John Parkinson supplied in his incomparable "Garden of Pleasant Flowers" details of the rich material with which our old-time country gentlemen had it within their powers to furnish and embellish their gardens. Nothing whatever novel in the arrangement of a garden occurs. Knots, mazes, mounts and all the rest continue as formerly, but the number of flowers, principally "outlandish" flowers, are enormously increased, and in fact, for all the purposes of garden decoration, allowing somewhat for what a florist would consider a weakness in quality, it is clear that a garden in the beginning of the seventeenth century could have been furnished with as varied a selection of beautiful flowers as it would have been possible to supply during the next two hundred years. Even to-day we may well doubt whether numbers of gardens possess treasures of floral beauty equal to the "Garden of Pleasure."

The author, indeed, declares it possible to have a garden gay with flowers in nearly every month. "Whosoever—may have for every moneth severall colours and varieties even from Christmas untill Midsommer or after, and then, after some little respite, untill Christmas againe, and that in some plenty, with great content and without forcing, so that every man may have them in every place." He mentions about a hundred Daffodils, ten Fritillarias, fifty "Iacincths," "some like unto little bells or starres, other like unto little bottles or pearles, both white and blew, sky-coloured and blush, and some starlike of manv pretty various formes."

Then of Crocus there were twenty sorts, Lilies as many, Tulips beyond reckoning, and Anemones the same. Carnations of every colour in great variety, with Auriculas, Pinks, Holikocks, Hepaticas in ten sorts, and a great variety of other flowers. A lengthy chapter on the Carnation establishes the fame of this the queen of hardy flowers, and shows

the extraordinary hold it must have already gained as a high-class garden flower.

The cultivation of the Tulip, too, is recorded at much length and with not a little clearness in the details, and with regard to the treatment of Daffodils it would be quite safe to follow bluff John as a guide. He shows that this bulbous plant and, perhaps, some others, may be kept out of the ground without harm till the end of the year, and that they bear transplanting at the flowering stage with impunity, the latter a wrinkle that every present day gardener has not appropriated.

Names are, of course, a difficulty. Though there were plenty of Snowdrops, we must look for them among bulbous Violets! and though he pictures and treats on the Tuberose, it is by name of the Indian knobbed Jacinth. *Tradescantia virginica* is described as the soon-fading Spiderwort of Virginia, and is included in a chapter devoted to St. Bruno's and St. Bernard's

Lilies, which the author thought possessed affinities in common with the *Tradescantia*. A very extensive collection of Irises is named, and described under a variety of sectional names. Even a few Orchids were admitted into this garden. *Orchis latifolia*, *O. maculata*, *Habenaria bifolia*, *Ophrys apifera*, and *O. Myodes*.

Among Auriculas we have to look for *Ramondia pyrenaica*, which was distinguished by its Borage leaves from other sorts. It is curious to come upon this and other plants we now know under different designations; another of which may be mentioned is *Kochia scoparia*, here called "Scoparia or Belvidere Italorum Broome Tod Flaxe." *Thalictrum aquilegifolium* figures as Spanish Tufts or Tufted Columbines, and *Adonis vernalis* is "The Great Oxe-eye or the yellow Anemone." Tomatoes were cultivated along with Medicagos (called "Snails") as curiosities in the flower garden.

Not the least interesting phase of gardening was the hold that shrubs, evergreen and flowering, had gained in English gardens; Lilacs, various Clematis, *Laurustinus*, varieties of Cherry with double flowers, *Solanum capsicastrum*, *Rhus typhina*, Virginian Creeper, *Crataegus pyracantha*, and our now common Laurel, as well as Portugal Laurel, being a selection.

A few of the better class herbs, especially those with variegated foliage, were cultivated among flowers. Among these we discover the tricolor Sage, which at present is very rare, but not by any means an undesirable plant. Basil, "Lemon" and variegated Thyme and Sweet Marjoram also were highly esteemed: of the latter it is remarked "The Sweet Marieromes are much used to please the outward senses in nosegays and in the windows of houses." In this we have surely lost something. Then he mentions "yellow or golden Hyssope—so pleasant in colour, especially in summer, that they provoke many gentlewomen to weare them in their heads and on their armes with as much delight as many fine flowers can give." Adorning arms with vegetation seems to have been very common at this period, among other material used being the green Strawberry, specimens of which I saw exhibited perhaps twenty years ago in Edinburgh. How easy to satisfy with flowers were the grand dames of London is further proved by Parkinson's description of a nosegay.

In describing *Tropæolum indicum*, he remarks: "The whole flower hath a fine small sent, very pleasing, which being placed in the middle of some Carnations or Gilloflowers, make a delicate Tussimussie, as they call it, or nosegay, both for sight and sent." Could anything be simpler in material or more charming in the effects proposed?

Before leaving this enticing part of the subject I must mention the custom related by our author of gentlewomen (obviously confined to bed by illness) decorating their beds with a *Calamagrostis* "tyed in tufts, to set them instead of feathers about their beds—when as they have been much admired of the Ladies and Gentles that have come to visit them."

Like all his predecessors, Parkinson found it impossible to conclude his book without having something to say of vegetables and of fruit trees, and though less esteemed at the present day, his remarks on these are equally valuable with those on flowers. For example, he informs us that Muske Melons had lately come into cultivation, but we gather that more had failed than those that had succeeded in bringing fruit to perfection. The best seed is said to be Spanish. When it is noted that bell-glasses were the best covering available, it is not wonderful that success should have been problematical. As to the quality of the fruit when ripe, we are left to conjecture, but it was eaten with pepper and salt and drowned in wine! Cauliflowers were very uncommon, and the plants were raised on hotbeds, and seem to have been very late, as frost is said to destroy the plants before heads were formed. Tobacco was now and for long after cultivated as a garden herb, and it is incidentally mentioned that Liquorice was planted by the acre. It is curious to read to-day that Bloodwort (*Rumex sanguineum*) was one of the principal vegetables cultivated in a garden, being in constant use in cookery. Cabbages, as still practised by cottagers in Scotland, were set along the outer portions of other vegetables.

In this compendium it is interesting to fall upon the earliest mention of Celery. It is here called Sweet Parsley or Sweet Smallage. It appears to have been introduced from Venice, the Venetian Ambassador having been the first known to have cultivated the plant in his garden "neare

*Tritoma uvaria*. (See page 262.)

Bishopsgate streete." Three kinds of Potatoes are described, viz., Spanish or Convolvulus Batatas—the Potato of Shakespeare; Virginia Potatoes—the sort of the present day, which were not much in use; and Potatoes of Canada or Jerusalem Artichokes," so common that even the most vulgar begin to despise them."

Of Peas there is nothing new to be said, only that the earliest were produced at Fulham. It is not a little curious to find *Physalis Alkekengi* figuring as a vegetable, and also the Strawberry, the constant use of the foliage no doubt being the reason in its case.

Parkinson's Orchard is superior in many respects to that of Lawson, though it is perhaps hardly worth while to indicate too closely the respects in which that is so. The method of managing wall trees at this period are, however, so interesting that a few words must be permitted on this, and let it be remembered that the writer is detailing not so much his own practice as the best methods employed by gardeners of his acquaintance.

"Divers," he remarks, "by carefully nipping away the waste and superfluous buds, doe keepe their trees in conformity, without much cutting." It was the practice of some others to anticipate the usual winter pruning and training by overhauling their trees after the fruit was gathered. Then, can anyone to-day improve on the local treatment of canker? "Most men," he says, "doe wholly cut away as much as is fretted with the canker, and then dresse it—with vinegar and cow's dung." The last-named mixed with urine is recommended as a wash to apply to the stems of Apples and Pears to protect from rabbits and hares. I have used the same with the addition of a little clay with every success. Concerning Vines, he considered it fruitless labour to attempt planting vineyards, but he commends the practice of raising Grapes on walls, and cautions against allowing the Vines to bear too many bunches.

No fewer than twenty-four kinds of Grapes are described; some of these are still familiar. Of the White Muscadine, he relates bunches had been produced that weighed 6lb. and berries half an ounce each. The Frontignac and Alligant will also be recognised. A very large number of Cherries are mentioned, and also of Plums; while the list of Peaches is remarkable, Newington being a variety still familiar. Of Nectarines seven sorts are described, and were held in higher esteem than were Peaches.

Apples were numerous, and among these are such familiar names as Golden Pippin, Flower of Kent, Densan, Leathercoat, and Cat's-head. Even more interesting is the chapter on Pears, as indicating the great variety of that pleasant fruit in general cultivation, and not a few of these by their names undoubtedly English, as, for instance, the Windsor. "Peare Gorgonell is an early Peare, somewhat long, and of a very pleasant taste."

How exceedingly plentiful was this fruit may be gathered from the remark: "They are eaten familiarly of all sorts of people, of some for delight, and of others for nourishment, being baked, stewed, or scalded." In the chapter on "Oranges," in which it is stated that Citrons and Lemons will not live in England, some interesting notes occur on the method of wintering the plants, and what may be called an early form of plant-house described. They were placed in the open in summer, but had to be protected in winter, as he says in some instances, when planted in "great square boxes" by being removed under cover, "others plant them against a bricke wall in the ground, and defend them by a shed of boardes, covered over with a seare-cloth in the winter, and by the warmth of a stove or other such thing give them some comfort in the colder times; but no tent or mean provision will preserve them." The whole of the treatise of fruits, indeed, bears out what the author affirms in the Epistle to the Reader, that the country at this time was better stored and furnished with fruit than "ever in any age before."

The book is well known to have been published in 1629, but Parkinson states that it was long before this intended to be published, so that it may well be accepted as picturing the best things in cultivation at the period under review—the earlier years of the seventeenth century.

A few items of interest from a contemporary writer, who, among other subjects, treated gardening from a commercial point of view, may be of interest as rounding off the question in all its phases. Ground for market gardening near London was let as high at this period as £6 an acre, and among the crops mentioned as being cultivated

in large breadths are Roses, Cloves, Gilliflowers, Liquorice, and Lavender. Turnips and Kidney Beans were also grown by the acre, and Strawberries seem also to have been extensively cultivated, a method of producing large fruits by the application of manure water showing that the business was carried out on other than haphazard lines.

It seems hardly credible that many crops produced £50 and £60 an acre, and it is plain that a market gardener 300 years ago enjoyed a more rosy existence than his present day representative. He was, however, a notoriously exclusive individual, and in order to guard against the repeated introduction of a new species—the private gardener—into his ranks, he secured from James I. a monopoly of the trade, and we find him quite a century later putting the power placed in his hand, if not to oust from the ranks, at least to persecute to the utmost, a gardener—Switzer—who attempted to establish himself among them.—B.

## The Potato Disease.

### A PUZZLE FOR SCIENTISTS.

We are a puzzle-solving race—or at least we ought to be—judging by the wave of solve-me-if-you-can competition which is passing over the land. Millions of the British race must each week be deeply engrossed in attempting to unravel the posers set them in periodicals, which vie with each other in the attempt to catch, and hold, the public eye. Some good is undoubtedly done by such means, as it shows a way in which all may spend a pleasant hour, and leads others to become thinkers and investigators. Beyond that, however, when the puzzles have been chiefly solved, the world in general is none the better, and there is no advancement to be recorded on the credit side of human knowledge. How different things might be if the tremendous amount of mental energy exerted in solving problems, already known to a few, could be directed toward the serious ones which confront us in various walks of life.

In matters connected with gardening there is certainly no lack of problems awaiting satisfactory solution, and if the thoughts and observant powers of all interested in "Adam's art" can in the future be more closely concentrated upon such problems, progress will inevitably follow.

Among crops generally grown the Potato will supply enough curious examples of erratic behaviour to engage the attention of a few thousands, and there are many puzzles connected with the disease which have not yet been satisfactorily solved, although great advances have been made during the last twenty years. In this matter we are greatly indebted to scientists, who have taught us much concerning the dreaded disease, *Phytophthora infestans*, and have provided a valuable remedy which is unfortunately too little used.

Recent observations have, however, convinced me that there is a "missing link," if not several "missing links," as to the various methods by which the disease is spread. The usual course by which it is transmitted to the tubers is through the medium of leaves and stems. The active spores, having settled on the leaves, spread their mycelium through the tissues of such leaves, and downward through the stems to the tubers. It must, therefore, necessarily follow that the disease should first attack the tuber at the point where it is connected with the stem by means of the thread-like off-shoots. This is so in many instances, but by no means in all, and hence arises the question as to whether a tuber may not contract disease from active spores in the soil without any connection with top ground?

I am led to ask this question in consequence of a puzzle which was brought to my notice a few days ago when visiting some noted Potato-growers. I then saw a splendid crop—such as would delight the eye of an exhibitor—being lifted, and disease was already apparent in some of the finest tubers. The growers selected a beautiful shapely example six or eight inches in length, and drew my attention to the fact that it was only diseased on the end opposite to that by which it was connected with the stem: on no other part of the skin could the slightest trace of disease be found. The Potato was then cut into equal parts, from end to end, when it was clearly seen that the disease had only penetrated the outer skin: not a trace could be seen in the starchy matter, and none near the thread-like stem growth which connected the tuber with the main stem. No other tubers were growing near enough to touch this particular one, and as it had clearly not contracted disease from the stem, from whence did the disease come?

The only conclusion I can advance is that the active spores which fell from the leaves on the soil, were able to penetrate the soil, and to find as suitable a medium for germination and growth on the tuber as on the leaf. This is a point of interest to all, and if any of the able scientists connected with the Royal Horticultural Society can throw light on the matter a puzzle having great practical value will be solved.—R. H. S.

### "Botanical Names for English Readers."

The undersigned present the following query:—"Can you tell us if 'Botanical Names for English Readers,' by Alcock, is written in dictionary form? Also if anyone can supply us with a copy? It is an oldish book, and we cannot locate one at the moment."—MORGAN AND Co., 8, St. Mary-at-Hill, London, E.C.

### Wash for Gooseberry Buds.

If "Fruit Grower" will try two bushels of fresh lime, with warm water, in a large tub, and when hot add 10lb of Russian tallow, stirring until "drawn" and thoroughly melted, he can then strain it through a home-made sieve of fine-meshed zinc, nailed on to a square box 2in deep. When this is done, add two bushels of soot, through the same sieve. Thoroughly work these all together, and then strain it all through again, into a forty gallon barrel. While still warm, we apply this wash to Gooseberries, Currants, Plums, and any mossy trees by syringing. Use a nozzle syringe, not the ordinary spray. One must have a fine morning, for if caught by rain before the wash dries it will wash off, but if once dry it will keep on through a season. The tallow is important, and must be sufficient to keep off rains. Very rainy seasons may want a second doing. We have not had sawfly since using this simple remedy.—HENRY GALTON, Shawford House Gardens, near Winchester.

Our experience for the last ten years has proved that the only perfect protection is to thread the branches, using "Royles' Threader," as supplied by any seedsman. The buds are absolutely untouched. It is only a question of one or two minutes to each tree, and should be done before severe weather commences, say, about the middle of November. Once each year is sufficient, and the cost is infinitesimal, the result being always certain.—THOS. FLETCHER.

### Red Spider.

Who has not had his share of combating with the insidious attacks of this little "animal"? For it is not an insect, scientifically speaking. Few establishments are unacquainted with his presence at some time or other during the year, and more especially if the season is a hot and sunny one. He is, however, not by any means unknown in wet seasons. Where borders are entirely constructed inside, the predisposition to spider is very much greater. On the other hand, outside borders, especially those having a tendency to the damp side, may never be troubled with this pest. Indeed, I know some such borders where the appearance of spider was never known. This corroborates the well-known fact that defective moisture at the roots has a great deal to do with the first appearance of spider. It is pretty well understood that moisture is inimical to the welfare of spider, and as a safe course for preventing its appearance, this is the best known, at present, to gardeners. To be effectual, never allow the roots to get into a state dry enough to give rise to an attack.

This is, perhaps, in many cases, not such a simple matter as one would imagine, especially where the practice obtains of not allowing the operations of the syringe beyond the period of the breaking of the young buds. Many good practitioners maintain that beyond this period, surface moisture tends to unduly enlarge the foliage, and in consequence become in texture ill adapted to support a heavy crop of fruit. This may be so, but we think with necessary attention, a due amount of fresh air, which is always available, any danger arising from this can be rectified. When surface moisture and syringing are not admissible, the liability of defective root moisture becomes proportionately greater. Few can hardly believe the amount of moisture, under such circumstances, that a full-grown, healthy Vine absorbs in a hot day from the soil.

The attack generally takes place before the gardener suspects the presence of spider; indeed, it often happens that the little fellow has got a fair footing before it is detected. Then, of course, a rush is made to half drown the roots and foliage with water, perhaps fumigating and so forth, with only comparative success. The vitality of the spider is phenomenal; cold or heat

apparently does not very much interfere with its progress. Fumigating appears only to partially annoy him, and though sulphured pipes may be a preventive, it is not a cure. For my own part, I believe an occasional dressing of short grass from the mower a very good antidote for spider. I have always kept him at bay with this, and therefore recommend it to others as worthy of a trial.—C.

### Query: Vegetable Marrow Jam.

Would "J. C." or any other reader kindly give the recipe for Vegetable Marrow jam mentioned in *Journal of Horticulture* for September 10? That which we have previously tasted was very nasty.—E. C. C. D. [There may be various recipes for making the jam. We would be pleased to hear from readers.—Ed.]

"W. A." who has a large quantity of Elderberries, would be much obliged for a recipe for making wine from them.

### The Croft, Burcote, Oxford.

The many people who go up and down the river Thames all speak in high praise of the beauty and charm of The Croft, a riverside residence near Dorchester, which belongs to S. Randell Higgins, Esq.

This charmingly situated place is now at its best, and I am sure no words or paint could do justice to its sub-tropical and fairyland-like appearance. The flower beds and borders are filled with *Dracenas*, *Fuchsias*, *Humeas*, *Galtonia candicans*, *Cannas*, *Nicotianas*, *Ricinus*, *Silver Thistles*, *Ophiopogon*, *Calceolarias*, *Lobelias*, *Gladioli*, which are well grown and judiciously intermixed so as to give a charming effect. The boat-house and the balcony of the residence are enhanced in beauty and effect by hanging baskets containing an assortment of flowering and foliage plants, also by boxes and pots filled with plants—in all, over 400 plants.

On the lawn, close to the river, are several large tubs filled with the Ivy-leaved *Pelargonium Madame Crousse*, each about five to six feet high and twelve to sixteen feet in circumference. The towering *Coniferae* and the large and well grown forest trees relieve the architectural beauty of the residence.

Fruit crops here are under average, with the exception of Apples, which are a heavy crop. The many houses and frames are well filled with healthy and well-grown plants of *Caladiums*, *Ferns*, *Fuchsias*, *Stephanotis*, *Campanula pyramidalis*, *Crotons*, *Dracenas*, *Tuberous Begonias* (200 plants, some four feet through), *Gloxinias* (1,000 plants, which are going over), *Primulas* (200 plants, very healthy). The 500 pot *Strawberries* of *Royal Sovereign* and *Vicomtesse H. de Thury* look remarkably well.

The *Tomatoes*, *Holmes's Supreme* and *Sutton's Satisfaction*, have, and are, fruiting excellently. The *Melons*, *Hero of Lockinge*, *Best of All*, *Windsor Castle*, *Triumph*, *Sutton's Scarlet* and *Epicure*, are all carrying huge fruits. The *Cucumbers*, *Royal Windsor*, *Improved Telegraph*, and *Market Favourite*, give every satisfaction, and are carrying heavy crops of fine fruits. The work and condition of the place as a whole testifies to the excellent abilities of the very able gardener, Mr. A. Morris, who will shortly be leaving Mr. Higgins' service.—S. HEATON.

### Solomon's Seal.

*Polygonatum*, or *Solomon's Seal*, is a common occupant of the herbaceous border, but very frequently does not receive much attention. It is, however, an excellent subject to grow in pots for early forcing. If strong roots are growing in the garden, lift them in November, and pot in ordinary potting soil in 6in or 8in pots. Treat them in the manner usual with bulbs—that is, plunge under ashes outdoors until growth begins, and then remove to the cool greenhouse, affording a little heat later on to help them to flower. The plants produce long stems, which curve outwards in a charmingly graceful manner, on which are borne long white pendulous flowers, which are very sweet scented. A few plants will fill a greenhouse with delicious perfume. If roots are not procurable in the garden, the bulb nurserymen can easily supply them at a reasonable rate. After doing duty in pots, the roots may be planted out, choosing for them partially shaded borders, where they will prove attractive every spring. A top-dressing of soil and manure applied in March, just when growth is beginning, will prove beneficial.—E. K.

## Campanulas for June and July.

No section of summer flowering hardy plants that I know are more useful for brightening up the borders and rockeries than Campanulas, that open their flowers during the months named. Having taken for some time a special interest in this family, I thought a note might be of service to intending planters during the coming autumn.

The following are dwarf growing varieties specially suited for the rockery or edgings to paths, the latter a form of culture which is not only interesting, but useful. *C. G. F. Wilson* produces an immense number of dark violet blue handsome bellflowers, the growth is quite dense and very hardy. *C. Ranieri* is quite the best of dwarf-growing varieties with large flowers. The stock seems to be very low: too many persons sell *G. F. Wilson* for this variety. The difficulty appears to be to get it true to name. In height it grows but three inches, and bears rich blue bellflowers, over an inch across. *C. carpatica* grows nine inches high and flowers freely, and is a good plant, but is eclipsed by *C. C. "Riverslea,"* sent out by Mr. Prichard. This variety grows a trifle stronger than the type, and bears bells quite freely two inches across. This is a gem for any purpose.

*C. garganica hirsuta* grows four inches high, produces trail-like flower stems, which are densely covered with pale blue flowers, each having a distinct white eye. *C. garganica minor* is even smaller than the type, quite a gem. *C. muralis* (syn. *Portenschlagiana*), 6in., has deeply cut leaves, grows freely, and produces abundantly its dark purple blue flowers, on spikes nine inches long. *C. glomerata dahurica* (one foot) gives its purple blue flowers freely; *C. turbinata*, 4in., deep purple; *C. t. hybrida*, 6in., pale blue; *C. t. pallida*, azure blue, are all three gems for the rockery. *C. punila alba* grows quite freely and flowers abundantly.

*C. Hosti alba*, 9in., is a charming white flowered variety that should be in every collection. *C. Tommasiana*, 6in., pale blue, drooping flowers. *C. carpatica "Isabel"* (Prichard) is a finer form than *C. "Riverslea,"* and a deeper blue, quite a gem. *C. pulla*, 3in., dark blue.

Those named below are all taller in growth, many suited for a wide rockery, on which they succeed even better than in the open border. *C. Hendersoni*, 2ft., in two years produces a bush fully as much across, and produces quite freely its rich dark blue blossoms on stout stems. No collection should be without this sort. *C. aggregata*, 15in., is azure blue.

*C. pyramidalis alba* is one of the finest border plants known when properly grown. One plant two years old has at the present time twenty-four fully developed spikes of bloom nearly six feet high, the spikes clothed quite thickly from close to the ground to the summit. *C. versicolor*, 2ft., has a stem similar to *C. pyramidalis*, but the flowers are produced close to the stem. In colour the flower is somewhat difficult to describe. The centre is purple claret, the petals pale blue at their base, deepening to the points. This is a distinct and desirable plant. *C. saltifolia*, 6ft., produces huge spikes, which are completely covered with its purple blue flowers. Every collection should include this plant.

*C. micrantha*, 5ft., has large leaves, deeply serrated, large, pale purple, bell-like flowers. These, too, are deeply and widely serrated, a fine border plant. *C. m. pallida*, as its name implies it, is a pale coloured form of the preceding.

*C. Bononiense*, 4ft 6in., produces spikes of bloom fully 2ft 6in long, and completely smothered with small pale blue flowers. *T. B. alba* is a fac-simile in everything but colour, which is snowy white. These plants occupy so little space in width that they give a maximum of flower while occupying but a minimum of space.

*C. grandis*, 3ft. The numerous spikes from a stout plant produce their pale blue flowers quite thickly. This is a real good border plant. *C. Burghalti*, 3ft., has immense pale blue bells, fringed at the edge, most freely produced. *C. Van Houttei*, 2ft., dark blue bells, freely produced.

*C. rhomboidalis*, 15in., deep blue. *C. lactiflora*, pale blue. *C. persicifolia* is still a fine border plant, growing four feet high, and producing its large saucer-like blooms in abundance. From this many superb varieties have been raised, notably *C. p. alba grandiflora* (Backhouse), which is the largest flowered of the species; pure white.

From this Messrs. Ladhams have raised several sterling varieties. *C. p. grandiflora* is an exact counterpart of the former, but in blue. Then we have *C. p. g. alba plena*, giving immense blooms of pure white, especially useful for wreath-making. *C. carpatica alba*, 1ft 6in., pure white bells, free.

*Campanula spicata* is a biennial, grows one to two feet high, and produces violet-blue spikes in July, such as are shown in the illustration.—E. MOLYNEUX.

### Spring Bedding in Hyde Park.

The illustration of the Hyacinths in Hyde Park, on page 273, speaks for itself. Hyacinths and Tulips are magnificent flowers, stiff, if you like, but yet beautiful, and indispensable.

## Royal Horticultural Society.

Drill Hall, September 15th.

This was the red letter day of the fungus specialist, and "the school" was forward in strong array. On many benches were the "Mushrooms and Toadstools," and at the lecture end of the hall there were cordons of coloured drawings representing the commoner edible species of Fungi. Besides these, the hall contained a fine exhibit of *Nepenthes* from Messrs. Veitch and Sons; Apples from Spooner and Sons; and Lettuces from Dickson and Robinson. Hardy plants, Ferns, Begonia flowers, and Roses were also in goodly quantity. Over 1,130 new Fellows have joined since January last.

### Orchid Committee.

Present: Harry J. Veitch, Esq. (in the chair); with Messrs. James O'Brien, de B. Crawshaw, W. Boxall, H. Little, J. W. Odell, H. A. Tracey, W. H. Young, J. Wilson Potter, Jeremiah Coleman, W. H. White, F. W. Ashton, A. McBean, F. J. Thorne, G. F. Moore, F. Wellesley, H. Ballantine, and J. G. Fowler.

Amongst those showing Orchids were H. T. Pitt, Esq. (grower, Mr. F. W. Thurgood), of Stamford Hill, with a bright display of fragrant species. His *Miltonia Blunti Luttersiana* was good, and *Vanda cærulea* strong. *Eulophia guinnensis*, with pale purplish lip, makes a pretty show, and with these he had a fine *Cypripedium x Felicity*, a large and beautiful flower.

Hugh Low and Co., of Bush Hill Park, Enfield, Middlesex, added grace to showy colours. They staged *Cypripedium Olivia*, *Vanda Hookeri*, *Cattleya Minucia*, *Oncidium incurvum*, and *O. carthaginiensis*, and some good *Odontoglossums*.

C. H. Fielding, Esq. (grower, C. Stocking), from Southgate, had some hybrid *Cypripediums*, crosses with *C. Rothschildianum* with *Pallas*, *Massanianum*, *Elise*, and others. *C. x Vulcan* was the handsomest in colour, but *C. x Massanianum* is large in size and good in form.

James Veitch and Sons, Ltd., Chelsea, S.W., had *Cattleya Pittiana*, of most brilliant colour, bronzy gold sepals and petals, and crimson purple lip; and another form of the same hybrid with reddish bronze large sepals and petals, and finer lip. *Laelio-Cattleya Haroldiana* is very pretty with its tea coloured segments and purple lip.

Mr. Timmis, Stone Hall, Oxted, Surrey, set up a *Cattleya Loddigesii*, carrying four leads and close on forty flowers. J. M. Crooke, Esq. Hoghton, near Preston (grower, Mr. W. J. Perkes), had a really beautiful *Cypripedium* named *Rappartianum*, a *Charlesworthii* cross, which latter it resembles in many points. He also had a strange *Laelio-Cattleya*, a cross between *C. Bowringiana* and *L.-C. Clive*, and in appearance it is more like a *Dendrobium* than a *Laelia* or *Cattleya*. We note his certificated variety elsewhere.

Sir Trevor Lawrence, Bart., sent plants of *L.-C. Wellsiana* magnifica, a good flower; *L.-C. x Proserpine*, and a fine piece of *Miltonia Bleuana*. His *Disa grandiflora* carried six flowers on one spike.

Messrs. Charlesworth and Co., Heaton, Bradford, staged a very choice set, comprising *Brasso-Cattleya x gigas Digbyana*, *C. Chamberlainiana* (very handsome), *Brasso-Laelia Helen*, *Cattleya fulvescens* (very sweet), and *L.-C. callistoglossa*. With these they had *Lycaste hybrida*, a very pretty purple hybrid, the lip and petals white, spotted with purple. Their *C. x Lord Rothschild* is a perfect gem.

MEDALS.—Charlesworth and Co., Gold; H. T. Pitt, Esq., and Hugh Low and Co., Silver Floras; Sir T. Lawrence, Bart., Silver Banksian; C. Fielding, Vote of Thanks.

### Fruit and Vegetable Committee.

Present: Geo. Bunyard, Esq. (in the chair); with Messrs. H. Balderson, H. Esling, T. W. Bates, S. Mortimer, Alex. Dean, Geo. Ke'f, J. Jaques, H. Markham, G. H. Maycock, Owen Thomas, James H. Veitch, A. H. Pearson, H. Somers Rivers, W. Poupart, E. Molyneux, Ed. Beckett, and Jos. Cheal.

The chief exhibits before this committee were Messrs. Spooner and Sons' Apples, and the grand, samplary collection of Lettuces from Dickson and Robinson, of Manchester. It has been a good Lettuce season in most parts, and the plants were seen to advantage. The method of staging was first-class, the plants being in lines, set up as growing, in cocoa-nut fibre, and gave one a splendid means of comparing varieties. The firm's trial ground is about six miles from Manchester; and these Lettuces were all sown on May 30, and dibbled into beds 5ft by 4ft. Amongst the Cos were *Par Excellence*, a large sort, indeed the largest; also *Giant Market*, and *Champion White*. *Little Gem* is a firm, in-hearting new one. *Prince of Wales* seems of good average size. Then the Cabbage varieties (which were numerous) comprised *Great Heart*, a tender-looking, firm plant; *Golden Head*, which contains more useable foliage; and *Buttercup* is another fine, firm, round variety, with bronzy foliage. And for general use there would seem to be no finer Cabbage Lettuce than *Unrivalled*. In this section the smallest one was *Magnet*. Of reddish leaved varieties there were *Firstling*, a fine kind; *Red Besson*, quite a

*Campanula spicata.*

large grower; and Continuity, of moderate size. As a large market Lettuce Dickson and Robinson's new Lord Kitchener should stand high; and as a novelty for garnishing we have here Staghorn, whose leaves are quite like a Stag's-horn Fern in miniature. (Gold Medal.)

Apples, as we note, came from Spooner and Sons, of Hounslow, and splendidly finished fruits they were; large, clean, and well coloured. Potts' Seedling, Duchess of Gloucester, Red Quarrenden, Alexandra, and all the leading sorts were here. (Silver-gilt Knightian Medal.)

Fungi.—A. Leth Smith, Esq. (gardener, Mr. Quartermain), Silvermere, Cobham, Surrey, staged a collection of Fungi, the best known being *Russula emeticus*, *Amanita mappa*, both poisonous; *Amanita rubescens*, *Fishilia hepatica*, and others, amongst the edible sorts. It was a large and interesting collection.

Amongst others who staged collections were the following: Thomas Bristow, Manfield Cottage, Primrose Hill, Tonbridge; Dr. H. Franklin Parsons, Oakhyrst, 4, Park Hill Rise, Croydon; The Essex Field Club; Mr. Willard, Holly Lodge; A. Clark and C. Crossland, secretaries of the Mycological Club, Halifax; Yorks Naturalists' Union; J. F. Rayner, Ivy Bank, Highfield, Southampton. We furnish a report of Dr. Cooke's lecture on another page.

#### Floral Committee.

Present: Wm. Marshall, Esq. (in the chair); with Messrs. R. Dean, John Green, Chas. E. Pearson, H. B. May, Amos Perry, J. Walker, W. Howe, J. F. McLeod, G. Renthe, Chas. Dixon, C. J. Salter, Chas. Jefferies, R. M. Wallace, J. W. Barr, W. P. Thomson, E. H. Jenkins, Wm. J. James, H. J. Cutbush, Chas. Blick, F. Page Roberts, and Geo. Paul.

From Messrs. J. Cheal and Sons, Crawley, came a large collection of hardy flowers and Dahlias. These included the Cactus varieties, Clarence Webb, Mrs. Mawley, Clara G. Stredwick, Gabriel, Florodora, Mrs. Carter Page, Eva, Orion, Alpha, H. J. Jones, and others. The pompons included Mauve Queen, Nerissa, Psyche, and Donovan. The singles were beautifully staged. (Silver-gilt Banksian Medal.)

Messrs. H. Cannell and Sons, Swanley, contributed a large group of Cannas in six-inch pots, and carried large heads of their gorgeous flowers. Some of the best were Niagara, J. B. Van der Schoot, Mrs. G. A. Strohlein, Miss Amy Ket, Aug. Chatin, Mrs. F. Dreer, and Black Prince. (Silver-gilt Banksian Medal.) Mr. B. Ladham, Shirley, Hants made an effective bank of hardy flowers. (Bronze Flora Medal.)

From Messrs. Barr and Sons, Covent Garden, came a varied display of hardy flowers. The Tritomas were excellent. Gladioli were also represented in variety. Nymphaeas were also exhibited, but they wanted the sun to open them. A few pots of Colchicums reminded one of autumn. A few good Liliums and Montbretias were noteworthy amongst the many good things here. (Silver Flora Medal.)

Messrs. Gunn and Sons, Market Hall, Birmingham, made a fine display of Phloxes, which would have been seen to better advantage had a little foliage been employed. They were beautifully developed, and had not suffered by the weather. Some of the most striking were Sheriff, Ivory, Sesostis, Hercules, Etna, Jocelyn, Miss Pemberton, Esperance, Crepuscule, Sylphide, and Iris.

Baron Sir H. Schröder (gardener, Mr. H. Ballantine), Egham, staged a table of Nerines, and very bright they were. The pots were so full of bulbs that they were overlapping each other like Shallots. (Silver Flora Medal.)

Messrs. W. Wells and Co., Limited, Redhill, made a fine display of early flowering Chrysanthemums. They were also nicely arranged. The best varieties were: Carrie, a beautiful yellow; Jason, Blush Beauty, The Champion, Polly, Kitty, Orange, Esperance, Le Parisienne (a fine white), Goacher's Crimson, Leonard Peto, Bettie, Cactus, Champ de Neige, and Horace Martin. (Silver Banksian Medal.) Mr. A. L. Gwillim, Cambria Nursery, New Eltham, staged a good exhibit of cut Begonia flowers. (Silver Banksian Medal.)

Messrs. T. S. Ware, Limited, Feltham, made a good display of hardy flowers, the Gladioli being a fine feature. Phloxes were also staged in good variety, as were also Delphiniums, Helianthus and a variety of Asters. (Silver-gilt Banksian Medal.)

Messrs. Dobbie and Co., Rothesay, exhibited a large collection of cut Fuchsia sprays. These were most interesting and generally appreciated, although it cannot be said that they lend themselves for exhibition in this way. The best were Fred Passy, General Roberts, Abbé Farges, Mr. Gladstone, Champion, President, Duchess of Edinburgh, Duchess of York, and Achilles.

Messrs. J. Jefferies and Son, Cirencester, staged six boxes of Roses equal to many seen last July. They formed a pleasing feature to the show. (Silver-gilt Flora Medal.)

A large display of hardy flowers came from Messrs. W. Cutbush and Son, Highgate, the Phloxes, Pentstemons, Rudbeckias, Montbretias, and Asters were most prominent, the whole exhibit being tastefully arranged. (Silver-gilt Banksian Medal.)

A glorious display of Pitcher-plants (*Nepenthes*) were arranged by Messrs. Jas. Veitch and Sons, Limited, Chelsea, occupying half one of the central tables. The plants were in grand condition,

some carrying as many as forty pitchers. The leading sorts were *Nepenthes Wrigleyana*, a grand plant; *N. Rafflesiana*, *N. rufescens*, *N. Mastersiana*, *N. Hookeriana*, *N. Tiveyi*, *N. sanguinea*, *N. ampullaria vittata*, *N. distillatoria*, *N. intermedia*, *N. ventricosa*, *N. bicalcarata*, *N. Sir W. Thistleton Dyer* (a grand hybrid), and *N. mixta*. The firm also staged *Senecio tanguticus*, *Eupatorium japonicum*, *Smilax sagittifolia*, and *Achmidia chinensis*, the latter a plant with Vine-like foliage, and grows 14ft. in a season; grand for covering rough screens, &c. (Gold Medal.)

Mr. H. B. May, Dyson's Lane Nurseries, Upper Edmonton, staged a fine exhibit of *Adiantum Farleyense*, ranging in size from decorative plants to those of specimen size, the whole of them being well grown and perfect in colour. (Silver Banksian Medal.)

Messrs. W. Bull and Sons, Chelsea, contributed a splendid group of fine-foliage plants. The chief plants were *Kentia Fosteriana*, *Cocos Weddelliana*, *Dracæna His Majesty*, *D. Victoria*, and *D. Goldiana*. The Crotons were all well coloured, while a nice display of *Gymnogrammas* and *Ficus radicans variegata* completed the display. (Silver Flora Medal.)

Ferns came from Messrs. J. Hill and Son, Barrowfield Nurseries, Lower Edmonton, and were nicely arranged. The plants included some capital specimens, and several of decorative size. The *Gleichenias* were the chief features, and included the following Ferns:—*G. semivestita*, *G. Flabellata*, *G. dicarpa*, *G. Speluncæ*, and *G. dicarpa glauca*. *Pteris* and *Adiantums* were also strongly in evidence. (Silver Flora Medal.) Messrs. Paul and Son, Cheshunt, also staged hardy flowers in large bunches.

#### Certificates and Awards of Merit.

*Cattleya Loddigesi*, from Mrs. Timmis, received a Cultural Commendation.

*Cypripedium Lawrenceanum Gratrixianum* (T. M. Crook, Esq.).—The large dorsal sepal is white, with bold green veins, and the pouch is dull green. A.M.

*Cypripedium Rappartianum* (T. M. Crook, Esq., Houghton, near Preston).—Parentage: *C. Lathamianum* × *C. Charlesworthi*. A pretty form, like that of the latter parent, the dorsal sepal purplish with silvery edge, and the pouch brownish. A.M.

DAHLIAS.—The following received Awards of Merit:—

*Dainty, Cactus* ("Hobbies," Ltd.).—Primrose creamy centre, with rosy-mauve outer petals. A.M. R.H.S., and F.C.C. N.D.S.

*George Gordon* (Stredwick and Son).—Canary yellow centre, ruddy lower. Cactus.

*Darkness, single* (Cheal and Son and T. W. Ware, Ltd.).—Intense, deep blackish crimson, with yellow boss. A.M. R.H.S., and F.C.C. N.D.S.

*Mrs. H. Brousson, Cactus* (J. Stredwick and Son).—A bright and showy Dahlia, coloured bronzy-golden, slightly rosy tinted. A.M. R.H.S., and F.C.C. N.D.S.

*F. M. Stredwick* (J. Stredwick and Son).—A large Cactus, quilled petals, creamy white, with paler centre. A.M. R.H.S., F.C.C. N.D.S.

*Queen of Whites, pompon* (Chas. Turner).—A neat and pretty milk-white. A.M. R.H.S.

*Princess of Wales* (Cheal and Sons).—A pink single variety. A.M. R.H.S.

*San Toy, pompon* (C. Turner).—Creamy white, heavily edged purple.

*Sweet Nell, Cactus* ("Hobbies," Ltd.).—A pretty, rosy, shell-pink, good flowers, but hanging their heads. A.M. R.H.S., and F.C.C. N.D.S.

*Dahlia, Rosebank Scarlet* (Edward Mawley, Esq.).—A rich, scarlet-crimson single, with orange disc. F.C.C. N.D.S.

*Sidalcea candida, Rosy Gem* (T. S. Ware (1902) Ltd.).—The flowers are large, saucer-like, and profuse. The colour is a decided rose-purple. A.M.

*Smilax sagittifolia (aspera)* (J. Veitch and Sons, Ltd.).—The leathery leaves are over 4in deep, and as broad. They are heart-shaped, with rounded lobes, and are glossy on the surface. The colour is bright green, tinged with bronze. The hardy *Smilaxes* are not well known. This is a good climber. A.M.

*Senecio tanguticus* (J. Veitch and Sons, Ltd.).—A hardy border plant, with half-woody brown stems, growing erect to 5ft. and bears alternate leaves. These are bright green, deeply lobed, and the partitions again incised. This makes it very distinctive. The terminal inflorescences are loose and panicle, the starry flowers being deep yellow. A.M.

*Zygopetalum Bulli Roeblingianum* (C. G. Roebling, Esq.).—This showy *Zygopetalum* (lip large, purple at base, fading to nearly pink at edge, and mottled with white, the segments green and brownish) will be sold by Protheroe and Morris to-morrow (Friday), and the proceeds will go to the R.H.S. Building Fund. F.C.C.

#### Pelargoniums Ward off Snakes.

Pelargoniums in South Africa are said to be efficacious preservatives against snakes, as, though the flowers are in a sense scentless, the leaves contain a pungent odour, and, therefore, no snakes will approach a bed of the flowers. In the old colony, especially in those parts which are the hunting grounds of the puff-adder and the ringhals, it is common at farms to see beds of Pelargoniums at the homestead, and the plants in pots as close to the bedrooms as possible.

# FRUIT NOTES

## Figs under Glass.

**EARLIEST FORCED TREES IN POTS.**—Figs are more appreciated than formerly, and the earliest supplies are highly prized for dessert. Those out in large pots, say 13in or more, should have the roots examined, and as it is not advisable to increase the size of pot, a few inches of soil may be removed from the base of the balls. Loosen these a little at the sides to admit of fresh compost; remove the surface soil as far as loose, shorten the roots, and repot in fresh compost. Let this be of turfy loam, with a sixth of old mortar rubbish, and a handful of bonemeal with a quart of wood ashes and a pint of soot to each bushel of compost, thoroughly incorporated. Afford a good watering, and place the trees where they can have plenty of air, with shelter from heavy rains and snow, also safety from frost.

Trees in large pots that are stood on brick pedestals to prevent their sinking require different treatment. In their case every particle of old fermenting material (Oak or Beech leaves) should be removed, also all the surface dressing from amongst the roots, with a handfork. After shortening the strongest roots and attending to the drainage, apply a surface dressing of the compost named, with a fifth of well-rotted manure added, and ram it firmly into the pots. Supply water to settle the soil, and after that keep the house cool, dry, and well-ventilated until the time of starting in November or December. This method answers well for trees in 18in or 20in pots.

**SUCCESSION HOUSES.**—Remove all soft and useless growths, thin out where crowded, and when the fruit is gathered, cut away the growths that have reached the extremity of the trellis, and are not necessary for next year's bearing.

**UNSATISFACTORY TREES.**—Unfruitfulness is generally a result of exuberance, and commonly induced by too large and too rich borders. Lifting sterile trees is a certain means of promoting fertility, and should be performed as soon as the leaves have commenced turning yellow. Good drainage is of great importance, and should not be less than a foot thick with a drain to carry off superfluous water. There is nothing better for drainage than brickbats, with a thin layer over them of old mortar rubbish. Good turfy loam, preferably calcareous formation and interspersed with calcareous gravel or flints, when it needs no admixture, otherwise add a sixth of old mortar rubbish and a similar proportion of road scrapings. This forms a suitable compost for Figs, and 2ft depth of border is ample. The compost should be moderately moist when used, and a watering given to settle it. Keep the house cool and dry. A border of about one-third the width of the trellis, say 4ft to 6ft, is much better than a wide border, for what is wanted is a sweet calcareous soil firmly put together, yet so friable as to admit of the free percolation of water through consistently with retaining the elements essential to the production of Figs.—GROWER.

## Pine Suckers.

Those recently started should be raised near the glass as soon as the roots are plentifully made, so as to secure a sturdy, thoroughly solidified growth, especially in plants intended to be wintered in small pots. When the suckers become well rooted, transfer the strongest started in late summer to the fruiting pots at once, draining these well. Employ the fibrous part only of sound turfy loam, in lumps proportionate to the size of the pots. Jamaicas are apt to become weak and attenuated in growth when grown in large pots; 9in or 10in suffice for them, and they must not be grown away from the glass, or be kept very close and moist. Queens succeed in 10in pots, or very strong plants may be given a little more root space, say 11in pots; Envoies have all their requirements as regards soil supplied in 10in pots. Smooth-leaved Cayennes succeed in 10in pots, 11in at most, and Providence in 11in or 12in pots. The small plants should be shifted into 7in or 8in pots, in which they must be kept until spring. Plunge the pots in a bottom heat of 90deg to 95deg, in which they must be continued until the roots have taken freely to the fresh compost, when they may be raised, a temperature of 85deg being afterwards sufficient.

**GROWING STOCK.**—Young plants require free ventilation on all favourable occasions to keep them in a healthy, sturdy condition, maintaining a night temperature of 60deg to 65deg, with 5deg to 10deg more by day artificially, unless dull and cold, and keep at 80deg to 85deg from sun heat. Ventilate early in the day, but not so as to lower the temperature, keeping the bottom heat steady at 80deg. Water the plants whenever they require it, employing weak and tepid liquid manure. Avoid the use of the

syringe too frequently, as sprinkling the plants in the morning and evening will suffice in all but very bright weather. Fruiting plants should have a night temperature of 70deg, with 80deg to 90deg by day, closing at 85deg.—PRACTICE.

## A Pot Nectarine.

Following the article on "Orchard Houses" in our preceding issue, we have had a specimen pot Peach tree figured. Trees such as the one on this page are amongst the most profitable subjects in a garden. Year after year, for thirty years on end, the same sized pots will do for them, and every season they can be expected to yield a good crop. By reducing the root-ball annually, and supplying fresh, rich, loamy compost, the tree maintains its fertile condition. The orchard house treatment is simple, and a large number of varieties of all kinds of fruits can be grown side by side. Messrs. Rivers and Son, of Sawbridgeworth, make a speciality of such specimen pot trees as the one we here notice.

## Strawberries in Pots.

The plants must not be neglected in watering, but they are seriously injured by continuous needless watering. The varieties intended for early forcing should soon be given the protection

A Pot Nectarine.

of frames, only using the lights in frosty weather and to throw off heavy rains and snow, ventilating freely when the weather is mild, withdrawing the lights when fair, and when wet tilting them. Any plants that have the soil very wet, and remain so for some time without watering, should have the drainage seen to. The crowns are often too numerous, though some varieties, as La Grosse Sucrée, are single crowned, while other sorts, as Vicomtesse Héricart de Thury, have many crowns.

Where a number of small crowns cluster round the central one, remove the small ones sideways with a wedge-like piece of wood without injuring the central crown or crowns or the leaves. This will concentrate all the vigour of the plant on the chief crown or crowns, and though there will be fewer trusses of bloom there is no need to fear a deficiency of crop. There is nothing like a loose surface for Strawberries in pots, which prevents the soil leaving the sides of the pots, and admits of the water passing evenly through the ball, moistening the soil thoroughly.

A little dried cow manure or horse droppings, rubbed through a 4in sieve, applied to the surface of the pots, will keep all right there. Remove all runners, as they appear, also weeds, and do not allow the plants to suffer through want of room, giving them plenty of space for the full exposure of the foliage to light and air, which is essential to a steady growth, and plump, well-developed crowns.—G. A.

## Societies.

### Edinburgh Autumn Show, September 9th and 10th.

Continuing our report of this highly successful exhibition, we may say that more minute inspection than we had had time to give it confirmed the first idea of its great excellence, poor season notwithstanding. Not in one section, but in all, if it did not reach the highest water mark of some previous Edinburgh shows, it was little inferior to the best of them; possibly this was somewhat owing to the extent, variety, and beauty of the trade non-competitive exhibits, which probably surpassed all the previous efforts of the trade, and hid any deficiencies in the exhibits of private growers. As usual at the Edinburgh autumn shows, the most prominent feature in the competitive classes is

**FRUIT.**—The exhibits were somewhat short of some previous seasons, but with very few exceptions the quality was excellent. The first and most prominent on the list was for the best table of dessert fruit, decorated with plants or flowers. There were three entries, and for fruit Mr. Goodacre, Elvaston Castle, had an easy victory gaining 106½ points for sixteen dishes; viz., twenty-eight points for four dishes Grapes; Apples, two dishes, six and a half and seven; Melons, seven and eight; Pears, seven and a half and eight; Plums, seven; Figs, six; Nectarines, two dishes, seven and seven and a half; Peaches, two dishes, seven and nothing; these were mostly of superb quality. Mr. Kidd, gardener, Carberry Tower, was second with 90½ points. His Grapes were good, but some of the other fruits a little deficient. Mr. Smith, Oxenford Castle, was third, 86½ points. The prizes for decoration in this class were awarded separately, Mr. Kidd receiving first with 25½ points out of 28. His flowers were largely *Gloriosa superba*, Sunrise Roses, Francoa, Gypsophila and Smilax. The effect was rich, but much too heavy for the size of table. Mr. Smith received second for decoration with 21½ points, and Mr. Goodacre, with a sweet, elegant arrangement, only third, with 15 points. Many thought this should have been first, and in any case it was difficult to see why it was not second. It is not usually considered good taste for dinner table glasses to have such heavy flowers as white *Lapageria* dangling on the end of a wire, and two shades of pink Carnations used were not a harmonious blend.

The next prize in importance was for ten dishes of fruit. Mr. Goodacre was again first with fine Muscat of Alexandria and Madresfield Court Grapes, a good Queen Pine, Melon, Princess Peaches, Figs, Albert Victor Nectarine, Directeur Hardy Pear (extra fine), and a Gage Plum. Second, Mr. McKinlay, gardener, Wrest Park, Amptill. For twelve dishes hardy fruit, grown out of doors in Scotland, Mr. James Day, Galloway House, was first. For twelve dishes orchard house grown fruit Mr. Goodacre was easily first with grand specimens, his Apples and Pears being specially fine. Mr. Greenlow, gardener, Benmore, was second with fair fruit.

The class for six bunches of Grapes excited more interest than any competition in the show, as it had come to be known that Mr. Goodacre and the Messrs. Buchanan, of Kippen, would renew their Shrewsbury contest. The various exhibits under this class were excellent, and after long and careful examination Messrs. Buchanan were awarded first with two bunches each Muscat of Alexandria, Alnwick Seedling, and Black Alicante, gaining 49½ points out of a possible 52. Mr. J. Beisant, gardener, Castle Huntly, was second with fine examples of Muscat Hamburg, Muscat of Alexandria, and Madresfield Court, 47½ points. Mr. Green, gardener to C. M. Palmer, Esq., M.P., was third with 44½ points. His bunches were large and handsome, especially Gros Maroc and Muscat of Alexandria. In this class Mr. Goodacre was not placed. For four bunches Mr. Goodacre was first with Black Hamburg, Muscat Hamburg, Madresfield Court, and Muscat of Alexandria. These were awarded 27 points. Messrs. Buchanan got second award, with fine bunches, receiving 25½ points. Mr. Green was again third. For two bunches Muscat of Alexandria Mr. Hughes, gardener, King's Meadows, Peebles, was first with large, handsome bunches, not quite finished in colour. Second, Mr. Goodacre. For two bunches Black Hamburg Mr. Goodacre was first, Mr. Grieve, Kirkcaldy, second, and Mr. Kidd third. In a number of one bunch classes for various sorts, Mr. Goodacre, Mr. Green, Mr. Hughes, Mr. Grieve, Mr. Kidd, Mr. Sutherland, Polmont, and Messrs. Buchanan gained leading honours. Mr. Kidd was first with the new Grape, Diamond Jubilee; but the bunches were small, and hardly what was expected of this much-talked-of novelty.

Among miscellaneous fruits there was a fair competition, but except in classes confined to Scottish growers, the brethren from the South received most of the honours. In the class for twelve varieties of Apples, grown in Scotland, for which the Dunn Memorial Medal and £3 were given as first prize, there were no fewer than eleven competitors, mostly very good fruit for the season. The much coveted first award was gained by Mr. R. Sinclair, Congleton Gardens, East Lothian, with handsome fruits of leading varieties, mostly cooking. Mr. Day, Galloway House,

second; and Mr. Murray, Culzean Castle, third. Amongst "small" fruits there was nothing remarkable, good Currants and remarkably fine Raspberries from Mr. A. Dickson, Innerleithen. The Caledonian Society offer awards in fully forty classes of different Apples, which seems too many, as a number of the exhibits were most uninteresting.

Mr. Smith, Esq., Prestwick, Ayrshire (gardener, Mr. Lawrie), exhibited a choice collection of pot grown Apples, which were of very high quality. The specimens of Ecklinville, Peasgood's Nonsuch, Allington Pippin, Bismarck, &c., were very fine. A silver medal awarded.

**PLANTS.**—The various classes were well filled, but speaking generally were not up to a high standard of cultivation. Compared with plants seen at the leading South shows, those in Edinburgh seem poor, and are not equal to the specimens that have at times been the glory of Waverley Market shows. For a group Mr. Wood, Oswald House, was the only competitor, with a collection not rich, but graceful, and in arrangement was an improvement on Mr. Wood's usual exhibits. For four stove and greenhouse plants Mr. Wood was first, and Mr. McKenna, Ratho, second. In three Orchid classes, Mr. Sharpe, Freeland, Forgandenny, was first, and Mr. Wood second. Specimen Ferns were fine, Mr. Bruce, Murrayfield, being first with handsome plants, and Mr. Wood second. For Adiantums Mr. Moudie, Musselburgh, was first, and Mr. Pearson second. Dwarf British Ferns were a beautiful class, Mr. Brown, Waterloo Place, taking leading honours with very beautiful plants. Begonias were fairly good, and Fuchsias were well grown. Among foliage plants those shown by Mr. Thom were very attractive.

**CUT FLOWERS.**—The display of cut flowers was most extensive, and speaking generally the exhibits were fine, and more than anything added to the resplendence of the hall. Hardy border plants were a specially fine show, excelling anything seen anywhere this season. Sweet Peas were a good show, but miles behind Shrewsbury, where the display was grand in the extreme.

For Gladioli there were three competitors in each class of twelve and six spikes, and in both classes Mr. Bennett, Berwick-on-Tweed, Mr. Lawrie, Prestwick, Ayrshire, and Mr. A. Brydon, Innerleithen, were first, second, and third respectively. The quality was fine. For twelve Begonias Mr. Johnston, East Linton, was first with very fine blooms, and the Rev. R. Rodgers, from the same place, was a good second. For twelve Show or Fancy Dahlias Mr. Sutherland, Kirkintilloch, was first. The same gentleman was first for Cactus Dahlias and second for pompons. Mr. Thos. Robertson also showed well in the Dahlia classes. For twelve bunches Sweet Peas Mr. Malcolm, Duns, was first with a very fine lot, Mr. McKenzie, Aviemore, second, and a well-known grower, Mr. Duncan, Fogo, third. They were all fine considering the lateness of the season.

For six Orchids Mr. Sharp, Freeland, was first, and Mr. Veitch, Carlisle, second. Roses were fair for the season. In the class for twelve blooms Mr. Bennett, Helensburgh, was first, and the veteran rosarian, Mr. Parlane, Row, second.

For twelve Tea Roses Mr. Parlane was first and Mr. Bennett second. Roses in vases were a good show, but generally speaking not well set up. Mr. Whyte, Helensburgh, was a leading prize-taker, and also Mr. Parlane. In the classes for six vases Mr. Parlane was first, but the exhibit could hardly be called one of Roses in vases. About two dozen Roses tied to a stick with moss and squeezed into a vase is surely not the intention of the prize. Mr. A. Todd, Musselburgh, who was second in this class, had vases of good Roses, beautifully arranged. Pansies and Violas were a small show.

In the class for twelve blooms Chrysanthemums, not less than six varieties, Mr. Thos. Baird, Cambus, was first with marvellous blooms for September. Madame Gustave Henry and W. H. Lincoln were both very fine. Carnations were a nice show. Shown in vases these far eclipse the old method of single blooms on stands. Mr. Brydon, Innerleithen, had all the first prizes, followed hard by Mr. Bennett, Tweedmouth. In the classes for twelve and six hardy herbaceous perennials Mr. Brydon was first and Mr. Thos. Robertson second in both classes, with very fine exhibits, splendidly staged. *Eucomis regia*, *Lobelia Queen Victoria*, *Chrysanthemum maximum*, *Coreopsis grandiflora* were specially noticeable. For twelve bunches hardy border flowers Mr. Robertson was first and Mr. Brydon second, with handsome stands.

Asters were fairly good, but these should be shown in vases, and would be a welcome addition to a show. On boards with paper collars they are not worth looking at. Mr. Veitch, Carlisle, led with quilled, and Mr. Forest, Alexandria, with flat petalled varieties. Annuals were good and mostly well displayed loosely in vases. Mr. McAndie, Inveresk, was first with a handsome selection.

Bouquets were a small class, but fairly good, considering that the competitors (all ladies) seemed to be amateurs, the white shower bouquet by Miss Mackintosh being very elegant. For the most tastefully arranged dinner-table decoration on a space 5ft by 3ft, there were five competitors, showing fairly elegant work. The first prize was awarded to Miss Mackintosh, but

tastes seemed to differ much as to whether or not she deserved it. Her exhibit was rich, but certainly not elegant.

**VEGETABLES.**—In the collection for twelve kinds, Mr. Gibson, Danesfield, Great Marlow, towered above his fellows, which was as handsome a collection as ever exhibited, but judging from the points awarded compared with the possible obtainable, the judges had not thought so. They must have been in a severely critical mood. His Onions, Cauliflowers, Celery, Leeks, Carrots, and Beans were specially good. Mr. Harper, Tulliebelton, was second with a very fine lot, and Mr. Rae, Sunlaws, was third. In the separate classes for vegetables there was a very large display, mostly of good quality. Mr. Kidd was first for fine Cucumbers, Mr. Macdonald, Polmont, for twelve very fine Tomatoes, Mr. Harper for Peas, and Mr. Mackinlay, West Park, for Beans. Mr. Waldie, Dollar, had beautiful Celery. For twelve Leeks there was a keen contest, Mr. Macmillan and Mr. J. Cairns being first and second, both gardeners to the Earl of Home at different residences. For twelve Onions Mr. D. Murray was first with very fine samples of his Ailsa Craig. Mr. Caldwell, Polmont, was first for twelve varieties of Potatoes, six of each, and also for twelve kidney Potatoes, Mr. Hood, St. Boswell's, being first for twelve round Potatoes.

#### Nurserymen's Competition.

These were a prominent feature in the show, the Roses especially surprising everybody both as to their quality and quantity. For a collection of hardy flowers, not exceeding 100 bunches, a class in which there has been many a keen fight in Edinburgh, Messrs. Cocker and Son, Aberdeen, had matters all their own way, their usual opponents from the South being absentees; but the collection staged was well up to their reputation, and was a leading feature of the show. For thirty-six Gladioli, Messrs. Mair and Son, Prestwick, were the only exhibitors, but their stand was of outstanding merit. Dahlias were a splendid class. For a collection on a space 7ft by 5ft Mr. R. J. Hammill, manager, the Vineries, Acock's Green, was first easily with a very beautiful display, where quality and beauty of arrangement were both conspicuous. Messrs. Campbell and Son, Blantyre, were second with a good lot. They were also first for eighteen bunches and twenty-four blooms Cactus Dahlias, Mr. Smellie, Busby, following them in both classes. Mr. Smellie took the lead for twenty-four Show and Fancy Dahlias, Messrs. Campbell following, and for vases of Cactus and Pompon Dahlias Mr. Hammill was first.

The Rose classes were a most beautiful show, and the various prizes were most keenly competed for, chiefly by the old rivals, Messrs. Cocker, Croll, Dundee, and Hugh Dickson, Belfast. Messrs. Cocker had a long way the best of matters—it seemed to be their day. They were first for thirty-six, eighteen, and twelve blooms, with fine stands of good sized fresh blooms of beautiful colour, prominent among them being Captain Hayward, Madame E. Verdier, Marchioness of Londonderry, Caroline Testout, Mrs. J. W. Grant, Papa Lambert, &c. In all three sections Messrs. Croll, Dundee, were second, and Mr. Hugh Dickson third for thirty-six and eighteen. In Tea Roses Messrs. Croll and Adam and Craigmile were first and second. For twelve crimson Roses Messrs. Croll were first with beautiful blooms of J. S. Mill, and Messrs. Cocker second with very handsome Marie Baumann. For twelve pinks Messrs. Cocker were first with Mrs. Grant and Messrs. Croll second with Mrs. John Laing. For twelve vases of Roses (H.P.'s barred) Messrs. Ferguson, Dunfermline, were first and Messrs. Cocker second, a decision that would have been reversed if Messrs. Cocker had devoted a little more time to arrangement. For a collection of Roses to occupy a space 5ft by 5ft Messrs. Cocker were easily first with a very beautiful stand, prominent being a splendid lot of Alfred Colomb, Caroline Testout, Ards Rover, &c. An arch, mostly of Dorothy Perkins Cluster Rose, was very admirable. This class should be allowed a little more space. Cut Chrysanthemums were not remarkable, but Carnations and Picotees in vases were good, Mr. Whitehead, Selkirk, leading for Carnations and Messrs. Campbell for Picotees.

**TRADE EXHIBITS.**—These were, as usual, very numerous and good, and they contributed much more to the imposing and beautiful appearance of the market than the competitive part of the exhibition. So popular is the Edinburgh Autumn Show with trade exhibitors that it will soon be difficult to find space for them all in the Waverley Market. The flower and plant loving public are greatly indebted to the nurserymen exhibitors, as they have no other means of seeing many of the beautiful things shown.

The most prominent group was that of Messrs. Laird and Sons, Ltd., occupying over 1,000 feet of space, and was one of the most imposing ever put up even by this large-minded firm. Huge Palms, Bamboos, Dracenas, Crotons, &c., laid out in a unique and interesting manner, filled in with beautiful clumps of Mollis Azaleas, Lilliums, Eulalias, Orchids, &c., rendered this great exhibit a most attractive feature. One Palm (*Phoenix rupicola*), with a spread of over 20ft, was a source of great admiration. A gold medal was awarded. Another gold medal collection was the

beautiful exhibit of Messrs. Thos. Methven and Sons, arranged in an elegant and chaste manner: the effect was very pleasing. In the centre was a large group with Palms, Acers, Clematis, &c., surrounded by smaller groups of Lilliums, Chrysanthemums, Crotons, very beautiful Cocos Palms, &c.

Messrs. Dickson and Co.'s group was very large and imposing, with wealth of colour, largely supplied by their new double salmon bedding *Pelargonium Coronation Gem*. Some Vines in beautiful fruit, and others with striking foliage, were a feature in this fine exhibit, also beautiful vases of Roses. A silver-gilt medal was awarded. Messrs. Cunningham and Fraser, Edinburgh, had a splendid group of shrubs, including grand specimen Hollies; also a most attractive display of hardy border flowers. (Gold Medal.)

Mr. John Downie's exhibit was on a table and had a most imposing effect, largely consisting of cut flowers (arranged with great ability), hardy flowers, Carnations, Begonias, Violas, &c., being most noticeable. (Silver-gilt Medal.)

Mr. John Forbes, Hawick, exhibited a stand such as he is noted for, of everything choice in florists' flowers. Carnations, Phloxes, Pentstemons, Dahlias, &c.; also a circular group on the floor of East Lothian Stock and Hollyhock spikes, which were rather bare for effect. (Silver Medal.)

Messrs. Storrie and Storrie, Dundee, had a most attractive table, and most beautifully arranged, of Apples in pots, Begonias, Cockscombs, Feathered Celosias, *Streptocarpus*, new Iceland Poppies, and a host of other things. This was one of the most attractive exhibits in the show. (Silver-gilt Medal.)

Messrs. Dobbie and Co., Rothesay, had a gay and beautiful stand well arranged, as all their exhibits are, prominent being Cactus Dahlias (including their new gem *Lucifer*), Chrysanthemums, Violas, and Fuchsias of fulgens strain, of which one (*R. H. Hennell*) received an award of merit. (Gold Medal.)

Messrs. James Grieve and Sons, Redbraes Nurseries, had a beautiful exhibit of hardy flowers, including early Chrysanthemums, Violas, Carnations, and other attractive subjects, an award of merit being given for their new white Chrysanthemum, *J. C. Grieve*. (Silver Medal.)

Messrs. Laing and Mather, Kelso, had a large table of cut Carnations in great variety and choice quality, most elegantly arranged. At each end of the table was a miniature rockery planted with alpine gems, the whole having a pleasing and fascinating aspect. (Gold Medal.) Messrs. Campbell and Sons, Blantyre, exhibited choice variety of Cactus Dahlias, Carnations, &c. (Silver Medal.)

Mr. Henry Eckford, Wem, had his usual special exhibit of Sweet Peas, which were highly interesting, but his collection this season, while containing all the choicest sorts with which his name is associated, had little of novelty. Dorothy Tennant was the only one present that the public were anxious to see. Samples of Edward the Seventh and Scarlet Gem would have been welcome. (Silver Medal.)

Messrs. Wm. Thomson and Sons, Ltd., Clovenfords, had a nice table of decorative plants, and baskets of Grapes and Tomatoes grown with their well-known stimulants. (Silver-gilt Medal.) Messrs. Kent and Brydon, Darlington, had a small but interesting collection of Carnations. (Bronze Medal.)

A dainty corner in the exhibition was under the south gallery, where four of the most attractive exhibits were located. Messrs. Blackmore and Langdon, from Bath, presenting a charming stand of double Begonias, which captivated the fancy of the northern growers, no such beautiful exhibit having been seen here before. *W. Sparshott* (bright scarlet), *Dorothy Hardwick* (pink), *Avalanche* (white), and *Countess of Warwick* (golden apricot) were very beautiful. (Silver Medal.)

Mr. T. Jannock, the noted Lily grower from Dersingham, made his first appearance in Edinburgh, with a very dainty exhibit of Lily and retarded Lilacs. The Lily was the magnificent variety known as "*Fortin*," and was ahead of anything ever seen here before. The Lilacs were in beautiful bloom. (Silver Medal.)

Mr. A. F. Dutton, Bexley Heath, who has recently leaped into fame as a grower of perpetual Carnations, had a very beautiful exhibit, set up with charming taste, which gave the exhibit quite the air of novelty. *Floriform*, *Royalty*, *H. B. Crane*, *Madame Melba*, and others were very fine.

Messrs. Todd and Co., florists, Shandwick Place, had for their exhibit "*A Dream of Roses*," and was perhaps quite the most dainty setting ever accorded the queen of flowers. A table 16ft in length was devoted to bouquets, baskets, a magnificent harp standing 5ft high, an upright cross of white Roses, charmingly sprayed with pink, a wreath of crimson and pink, and a lyre of Pearl and Sunset yellow Roses, set in *Prunus Pissardi* foliage. The whole was nicely upholstered, and was a source of great attraction to visitors. (Gold Medal.)

Messrs. James Dickson and Sons, Edinburgh, were awarded a Silver Medal for a small collection of cut flowers and a fine lot of standard Bays, used to decorate the entrance hall. The Ranelagh Nursery Company, Leamington, had a nice lot of their new *Asparagus myriocladus*. (Bronze Medal.)

Messrs. Lister, Rothesay, had miscellaneous cut flowers (Silver Medal); Mr. James Rowatt, Glassford, a nice table chiefly Pentstemons of best varieties (Bronze Medal). Mr. Wm. Angus,

Penicuik, exhibited a nice stand of his beautiful new form of *Chrysanthemum maximum* King Edward, for which he was awarded a Certificate of Merit.

The attendance of the public during the two days was very large, the drawings at the styles amounting to nearly £430. This is a very large sum when the number of members and subscribers, who all get a number of free tickets, is taken into account. The cash drawings were £45 ahead of last year. Mr. Thomson, the energetic secretary, deserves great credit for the admirable way in which all the work was arranged and carried out, as well as for his praiseworthy courtesy and obligingness in what is often rather irritating circumstances.

The horticultural public will be glad to learn that at a meeting held on Saturday last of the Council of the Royal Caledonian Horticultural Society, it was resolved to hold a great international exhibition of fruit and flowers in autumn of 1905. Immediate preparations are to be made to carry this out on a scale of greater magnitude than any of the previous international exhibitions successfully held under the auspices of the Old Caledonian. The last International took place in 1891.

### National Dahlia, Northern Division.

The National Dahlia Society held its second show of the season at the Royal Botanical Society's Gardens, Manchester, on Friday and Saturday last; and considering the terrible storms of the past few days the show was unusually attractive, few soiled flowers being found in the stands. The general arrangement throughout was of more than ordinary merit. Mr. Weathers and Mr. Paul did all in their power to cater for the visitors by providing good music and plenty of promenading space. Many of the classes were lacking in competition, but the quality was most even throughout.

For thirty-six Show Dahlias, Mr. C. Turner, of Slough, was first with excellent flowers. Mr. S. Mortimer (who had suffered most severely from the storm) was a very good second, the flowers being smaller. Mr. J. Smellie, Busby, was a fine third. For twenty-four Show and Fancy varieties, Mrs. M. V. Seale, Vine Nurseries, Sevenoaks, was the only exhibitor. Only two staged in the class for twelve ditto, Messrs. J. Cheal and Sons winning with capital blooms.

The class for twelve varieties of Cactus, six flowers of each, brought out a charming set; and Messrs. Stredwick and Son, Silverhill Park, St. Leonards, took the lead. Messrs. Keynes, Williams, and Co., were a splendid second with telling blooms of Minnie West, Raymond Parks, Imperator, and Mrs. H. J. Jones; third, Messrs. J. Cheal and Sons. For the twenty-four Cactus, Keynes, Williams, and Co. scored, and Mr. J. Smellie was a smart second. The grand class in the show was undoubtedly that for twelve vases of Cactus Dahlias, arranged for effect, brought out some really good work on the part of Mrs. M. V. Seale. Messrs. Keynes, Williams, and Co., for second place, displayed good treatment in their work. Reliance (salmon, gold centre, a seedling), Gladiator, J. H. Jackson, Pink Pearl, and Mrs. Clarke were their best blooms. Mr. W. Treseder was third.

The pompon Dahlias attracted much attention, Mr. C. Turner taking honours with pretty flowers. Mrs. Seale second, and a very dangerous third were Messrs. Keynes, Williams, and Co., the flowers not being quite so large. The single Dahlias possessed a fascination for all. Messrs. Cheal were the winners.

The amateur section was moderately filled, but there were many striking flowers amongst them. The Show and Fancy Dahlias were quite equal to those in the professional classes. For twenty-four Show and Fancies, Mr. T. Jones, Bryn Penylan, Ruabon, led with typical flowers; Mr. E. T. Matthews, Derby, second. Mr. E. T. Matthews carried the honours for twenty-four Cactus, and Mr. J. Pilling was second. Mr. F. H. McGrath, Huddersfield, won for the twelve.

Messrs. Stredwick gained five certificates for new varieties, some of which did not appear to be any improvement on existing sorts. Comet, a deep heliotrope, striped crimson; Rainbow, rich rose but very thin; Hereward, warm creamy purple, and violet striped; George Gordon, yellow; and Mary, a Fancy Cactus.

TRADE EXHIBITS.—"Hobbies," Limited, Dereham, had a staging of sixty feet filled and arranged in the best style. A large gold medal was awarded.

Messrs. Dobbie and Co., Rothesay, sent of their best. Dahlias, Gladioli, herbaceous and florist flowers; in fact, everything for which they are famous was shown to perfection. The arrangement of colour was of the finest, and the large gold medal well deserved.

Yet another sixty feet was admirably filled by J. H. White and Son, Worcester. Phloxes, Scabious, early Chrysanthemums, Montbretias, amongst which was a handsome new seedling, yellow, with crimson blotch. Lobelias, Gladioli, Althæas in variety, and double Gypsophila. They exhibited a grand Tomato, White's Majestic, one bunch of seven fruits weighing 3½ lb. The gold medal was well deserved.

Mr. John Robson, Bowdon, secured the gold medal in competition for the best collection of herbaceous plants. They also secured the silver-gilt medal for a most beautiful collection of Dahlias in the best of varieties.

Messrs. Dickson and Robinson, Manchester, caused quite a sensation with their interesting display of Lettuces planted in cocoa fibre, quite a show in themselves. Their display of Dahlias, Gladioli, &c., were staged in extra choice variety.

On the opposite side the same degree of excitement was caused by the magnificent show of Tomatoes from Messrs. Dickson, Brown, and Tait, Manchester, consisting of 70 plates in 50 varieties and baskets, a very fine object lesson for connoisseurs, so well were they grown. Worth recording were: Invincible, Queen Alexandra, seedling, very free and handsome. Crimson King, extra good. Bunn's Superlative and Best of All in reds, and Golden Jubilee and Sunbeam in yellows. All the Fancy varieties were well represented. The highest award was granted to both firms. Mr. Edwards was well to the fore with his table decorations.—R. P. R.

### North Middlesex Dahlia.

This was held on September 9 and 10, and was the third exhibition of this growing society, and it took place as last year in the large hall of the Alexandra Palace, rather more than one half of it being filled with exhibits. The arrangements of the exhibits were considerably enhanced by a number of large specimen plants, and also groups of Ferns contributed by Mr. G. Hemming, the superintendent of the Palace Grounds. Certificates of merit were awarded to a promising new white Cactus Dahlia named Mrs. D. B. Crane, white, with primrose centre; and single Queen Alexandra, of charming heliotrope pink tint.

A certificate of merit was awarded to Mr. J. T. West, for Cactus Dahlia, Charing (pale orange, rich, the clawlike florets tipped with blush, one of the prettiest and most distinct of the tipped Fancy Cactus).

Messrs. W. Cutbush and Sons, Highgate Nurseries, had a bold collection of bunches of Cactus Dahlias and foliage plants.

Messrs. Wells and Co., Limited, Earlswood Nurseries, had a choice collection of early flowering Chrysanthemums.

Messrs. R. Emerson and Son, Fakenham, Norfolk, had a collection of Sweet Peas and other hardy flowers.

The Cactus Dahlia dominated throughout the show, and the best thirty Cactus were shown by Mr. W. Locker, of New Barnet. Mr. G. Stevens, Hornsey, was second. The best twenty-four blooms came from Mr. H. Brown, Luton; Mr. Stilwell, Finchley, was a close second. Mr. A. Brown, Luton, had the best twelve Cactus.

### York Dahlia, September 9th.

The first of York Dahlia shows was held on September 9th, in the large hall of the Exhibition building, and was as successful as the promoters could have wished. The Ancient Society of York Florists, in addition to the Chrysanthemum fixture in November, hold what are known as minor shows, and have this year made a new departure in connection with these smaller exhibitions by incorporating with the Dahlia Show the fourth of these minor fixtures; so that, in addition to the Dahlias, there were large numbers of classes devoted to other cut flowers and plants. Classes Nos. 1 to 78 inclusive were open to members of the society only, and the remainder open to all.

OPEN CLASS, DAHLIAS.—In the class for thirty-six blooms of Show and Fancy varieties intermixed, there were five entries, Mr. S. Mortimer, Farnham, Surrey, being placed first with a first-rate stand of bright, even-sized blooms. Messrs. Cray and Son, of Frome, second; and Mr. B. Stringer, Leeds, third. There was a splendid show of Cactus Dahlias, there being six entries for forty-eight blooms, in twenty-four varieties. Premier honours were awarded to Mr. W. Baxter, The Nurseries, Woking; Mr. S. Mortimer second, and Messrs. Clark and Son, Rodley, third. For twelve varieties of pompon Dahlias in bunches of six blooms each, Messrs. Cray and Son were first, Mr. W. Hutchinson, Kirby Moorside, second; and Messrs. Clark and Son third. For single varieties only two entered.

GROUPS.—For a group of miscellaneous plants and cut flowers, Mr. Cottam, of Cottingham, led, and the Rev. G. Yeats, of Heworth Vicarage, came second. For a similar table of Gladioli Messrs. Harkness and Son, of Bedale, had a very fair exhibit, setting up good spikes. Mr. W. Hutchinson was second. Messrs. Harkness and Son were also placed first for a table of herbaceous, or annual flowers, interspersed with summer flowering Chrysanthemums. Messrs. Kelway and Son gave a large silver-gilt medal and 7s. 6d., and a bronze medal and 5s., for the best collection of cut flowers and herbaceous perennials found in their "Manual" of 1903. Mr. Cottam had the best collection, Mr. W. Hutchinson second.

The same exhibitors who won in the open section were again in the running in the members', and the popular varieties were on view.

Amongst non-competitive exhibitors were "Hobbies," Limited, Dereham, with a capital stand (gold medal), Messrs. Isaac House and Son, Westbury-on-Trym, Bristol, had a large collection of herbaceous flowers, for which they received a silver medal. The same award was also given Messrs. R. H. Bath, Limited, Wisbech, for a stand of Cactus and pompon Dahlias and herbaceous flowers. Messrs. James Backhouse and Sons, Limited, decorated the orchestra with Conifers, Palms, and other plants.—J. S. U.

### London Dahlia Union, Sept. 16th and 17th.

The annual exhibition of Dahlias under the aegis of the Union was held on Wednesday and Thursday of the present week at Earl's Court, London. Mr. R. Dean, as secretary and superintendent, had seen to the proper furnishing of the Prince's Hall with Palms for the tables and green cloth for the walls, and the area was screened off from the public entrance. It was a good show, and competition was brisk.

**SPECIAL PRIZES (OPEN CLASSES).**—For a display of Dahlias in a space 12ft by 6ft ("Hobbies," Ltd., R. Dean, and W. Stevens giving the prizes), there was only one competitor (Mrs. M. V. Seale, of Sevenoaks), though two had entered. She certainly deserved the prize, even if alone, for the arrangement was a leading feature of the show. *Eulalia gracillima*, golden Elm, Asparagus, and *Berberis Darwini* were used along with the flowers, these being raised on bamboo tubes, 6ft high in the centre.

Three vases of Cactus Dahlias (Wm. Marshall's prizes).—Mr. Stephen Walker, High Street, Thame, with excellently dressed

**CACTUS DAHLIAS (OPEN CLASSES).**—For twelve varieties in bunches of six (Class 8), the first prize fell to Stredwick and Son, Silverhill Park, St. Leonards-on-Sea, with a set of varieties many of them new. Messrs. Burrell and Co. were second; Mr. Walker, Thame, third; and Cheal and Sons fourth; there being five good exhibits. For twenty-four blooms, distinct, the foremost place was taken by Burrell and Co.; second, J. Stredwick and Son; and Keynes, Williams, and Co., third, out of seven entries. For twelve blooms Mrs. Seale led with sweet flowers, Stredwick and Son second, Keynes, Williams and Co. third, and S. Mortimer fourth.

**CLASS 11 (AMATEURS).**—The "Hobbies" Challenge Cup, value ten guineas, and 40s., for nine bunches of Cactus blooms in trebles, was won by H. A. Needs, of Horsell, Woking, and Mr. W. Peters came second. Both lots were very moderate in quality. For the six varieties, Mr. M. H. Brown beat Mr. Mawley, and third, Mr. W. C. Pagram. For twelve blooms, Mr. H. A. Needs was first; W. Stephen, Isleworth, second; Mr. H. Brown, third; and Mr. Peters, fourth. Mr. E. West, jun., The Laurels, Hen-

Carter &amp; Co.

Hyacinths in Hyde Park, London. (See page 266.)

vases, beat Burrell and Co., Cambs., and third Keynes, Williams, and Co., Salisbury. Five entered. Mr. Walker had six flowers in each of his vases, and used grasses, Snowberry, purple Prunus, and Golden Honeysuckle.

**Six bunches of pompon-Cactus Dahlias.**—The pompon-Cactus may be defined as Cactus varieties of a small type, about 4in in diameter. For sprays they are useful. Keynes, Williams, and Co. were first with Dolly, Fairy, and Coronation. Mrs. Seale was second, and Burrell and Co. third.

**SHOW AND FANCY DAHLIAS (OPEN).**—For twenty-four blooms Mr. Stephen Walker, of Thame, Oxon, led with a fair average set. His finer flowers were Purple Prince, Mrs. Gladstone, Comedian, John Walker, Shottesham Hero, Duchess of York, Matthew Campbell, Florence Tranter, Merlin, Golden Gem, and Maud Fellowes. Second out of seven came Mr. C. Turner, and Mr. S. Mortimer third.

For the twelve in this section Messrs. Cheal and Sons were first, Mr. J. R. Tranter second, and F. Taylor and Sons, Chipping Norton, third. The latter had the larger flowers, but the others were of a better colour and greater refinement.

**AMATEURS.**—Mr. Anstiss, Brill, Thame, beat Mr. W. Peters, Holmhurst, St. Leonards, for the twelve Shows and Fancies in this section. For six blooms Mr. J. West, jun., of The Laurels, Henley, led; second, Mr. J. Findley, of Kingham; and third, Mr. W. Wheeler, Henley; the flowers all being fine.

ley, was followed by Mr. E. Mawley, and third Mr. Pagram, for the half-dozen varieties. H. A. Needs, Esq., was foremost; Mr. Mawley, second; and Mr. Taylor, of Finchley, third, for a vase of twelve blooms, with foliage. In Class 17, for six of a sort, there were seven good entries, the place of honour going to Stephen Walker, with Mrs. Mawley; Keynes, Williams, and Co., second, with a yellow seedling named J. Bryant; and third not discernible. Mrs. Seale was fourth with Mrs. de Luca.

**POMPONS (OPEN).**—In class 18, for twelve varieties in bunches, the lead was with Charles Turner, having Bacchus, Nellie Broomhead, Queen of Whites, Daisy, Nerissa, San Toy, Darkest of All, Jessica, Hesperia, Wilfred, Minnie, and Silvia. Mr. Walker, Thame, second; third, Burrell and Co.; and fourth, Cheal and Sons; there being seven entries. For the six varieties confined to amateurs Mr. J. F. Hudson led; Mr. M. H. Brown, Luton, second; and Mr. W. C. Pagram, The Whin, Weybridge, third out of five.

**SINGLES (OPEN CLASS).**—Messrs. Cheal beat Mrs. M. V. Seale for the dozen sorts, they having Darkness, a new one; also Hilda, Princess of Wales (new), Madge, Naomi Tighe, Miss Morland, Victoria, Serita, Leslie Seale, Vesuvius, Columbine, and Amos Perry. Mr. Walker, of Thame, Oxon, was a good third; and the Rev. S. Spencer Pearce, of Woodstock, Oxon, fourth; five showing. Mr. J. T. Hudson won for the vase of single Dahlias in class 22. Mr. A. Taylor, second; Mr. Ed. Mawley, third; and Mr. W. Peters, third.

The new varieties were being judged when our representative had to leave; but these will be noted in our next.

**NON-COMPETITIVE EXHIBITS.**—"Hobbies," Ltd. (Mr. John Green), of Dereham, filled half the length of the table on the south wall with Dahlias, all of the Cactus type, with arches of Smilax and bunches of Roses behind them. The other half of the same table was occupied by a gorgeous array of Gladioli spikes from Messrs. Burrell and Co., Cambridge.

On the opposite side of the hall there were collections of Dahlias from Messrs. Dobbie and Co., Rothesay; Cannell and Sons, Swanley; T. S. Ware (1902), Ltd., from Feltham; and Cutbush and Son, of Highgate, London. Mr. Eric F. Such had cut hardy border flowers; and the collection of Apples from Spooner and Sons, Hounslow, was very fine. Mr. J. T. West, of Brentwood, was also forward with a collection of Dahlias (pompons and Cactus), and Mr. Williams staged his Rustic Decorations from Ealing. Flower glasses came from James Green and Nephew, 107, Queen Victoria Street, E.C. Lawes' Garden Manures, in samples, came from 148½, Fenchurch Street, E.C. Messrs. Cheal had Dahlias. Pattison's Lawn Boots were shown.

### Moffat, September 11th.

This show, held at Moffat on September 11, in connection with that of the Moffat and Mid-Annandale Agricultural Society, passed off very successfully, although the competition in several of the classes was more limited than it ought to be in such a district. The managers might well consider the policy of throwing all the classes open, especially as some of the prize-takers in the confined classes do not appear to be included in the bounds of Upper Annandale.

The pot plants were well shown, and Mr. Ewan Cameron, Eriestane, won with a nicely arranged table of capital stuff over one of good quality shown by Mr. W. Murray, Ardenholm. Mr. Cameron had also the honour of carrying off the silver medal for the most meritorious plant in the pot plant classes. These were good all through, the leading prizewinners, in addition to Mr. E. Cameron, being Mr. Luke Fraser, Craigielands; Mr. A. Rankin, Viearlands; Mr. J. Hamilton, Heywood; and Mr. W. Murray, Ardenholm.

Cut flowers were very well grown and set up, and the Asters were much remarked upon for their quality. The leading winners in this section were: Mr. J. M'Allister, Drumcrieff; Mr. A. Rankine, Mr. E. Cameron, Mr. J. Raphael, Langshaw; Mr. J. Hamilton, Mr. Fraser, Mr. A. Taylor, Alfred Cottage, Mr. J. Allen, Mr. R. Stoddard, Thankerton; Mr. P. Marshall, Thankerton; Mrs. Farrell, Eaglesfield; Mr. D. Whitelaw, Locharbriggs; Mr. J. Pettigrew, Lamington; Mr. W. Murray, Mr. J. Purves, Marchbankwood; and Mr. J. M'Gillivray, Craigieburn, the latter carrying off all the firsts for bouquets and sprays.

There was little competition in the fruit classes except for Grapes, where some creditable exhibits were shown, Mr. D. Anderson, Sunnybrae, and Mr. J. Allen, Arundel, Dumfries, winning two firsts each, and Mr. E. Cameron and Mr. L. Fraser one each. The vegetables were not so good as in former years, and many of the prizes fell to winners in the classes already named. The winner for the collection was Mr. J. M'Allister, who set up a good variety of well-grown produce. The amateurs showed wonderfully well for the season, though their fruit was also very limited in quantity. The number of prizewinners here is too great for detail in the available space.—S.

### Kilmarnock, September 10th.

This old-established show continues to hold its own well as one of the leading provincial horticultural exhibitions in Scotland, and almost 200 additional entries cheered its promoters and gave promise of a good show, a promise which was amply fulfilled when it opened in the Agricultural Hall on September 10. Although the weather has been almost the worst on record for many years, the quality of the produce was, as a rule, splendid, and showed that much cultural skill and great care had been expended on the outdoor flowers and vegetables. The pot plants were exceedingly good and the cut flowers were surprisingly fine, although at this show these are always good.

In the open classes the Dahlias were very fine, Mr. G. Richmond, Mr. J. W. Templeton, Mr. W. Brown, or Mr. G. Richmond leading in all but the singles, where Mr. J. Kerr, Annick Lodge, was first. The best Gladioli came from Mr. Laurie, of Prestwick, that noted district for the Gladiolus. Mr. Begg, Dalry, was first for Pansies, the Violas from Mr. J. Muir being placed first in their class. Mr. J. Haddow led in the three classes for Asters, and Mr. J. Kerr in that for herbaceous. The Roses brought out a good competition, Mr. B. Martindale winning for twelve, and Mr. W. Hill for six. Among other winners in this section were Messrs. J. Tyre, H. M'Fadzean, D. Burns, G. Lawson, R. Brown, J. Anderson, W. Wilson, and J. Hart. Mr. T. M'Kelvie, Braehead, led for table plants and Dracaenas; Mr. H. Wilson for Fuchsias, greenhouse plants, Ferns, and Begonias, though Mr. A. Millar had the best two Fuchsias. Mr. J. Noble won for foliage

plants, and Mr. R. P. Laurie for Ferns, Mr. R. Brown being first for Chrysanthemums.

Fruit brought out a good competition, Mr. J. Hart leading with Hamburg Grapes and Mr. P. M'Donald with "any other" black; Mr. W. White, with white Grapes, and the same exhibitor with the best bunch of Grapes. Mr. D. Murphy had the best collection of Apples and the best twelve dessert and twelve kitchen Apples. Mr. R. Lawrie had the best Pears, and Mr. J. Hart won for the indoor fruit and the collection of hardy fruit. The vegetable classes were well competed for, and the first prize for a collection was won by Mr. T. Anderson; second, Mr. A. Dunlop; third, Mr. T. M'Kelvie. The amateurs' and working men's sections were well filled and some excellent produce shown.—A. T.

### Shropshire Horticultural.

The treasurers of this society (Messrs. William Phillips and James Vine) have had a list drawn up of the total subscriptions and receipts in connection with their shows, for each year since 1875 to 1902. In 1875 the subscriptions amounted to £318 odd, and this, with the gate money at the show, was £791. In 1890, the subscriptions were £428, and the general total for the year £2,963. Last year the society had £433 18s. subscriptions, £428 11s. 4d. from cheap tickets, £1,004 16s. 3d. and £1,918 5s. for the two days' respective takings, £1,216 4s. 10d. as "sundry receipts, including interest"; making a total of £5,001 15s. 5d. for last year alone. The grand total for the 28 years amounts to £79,586 15s. 8d.; and out of this £6,953 0s. 6d. have been donated for various improvements and objects connected with the town of Shrewsbury. Could not the committees of some poor, struggling gardening societies use some of the figures and facts in their letters of appeal to the well-to-do of their localities, and the members of their town Corporations? If outside people could be led to see solid, permanent, material gain in supporting a local organisation whose first object is the exhibition of the best garden produce of the land, doubtless they would more readily assist. But in too many cases the flower show is simply a flower show, and comes once a year. There is such a thing as courting the public aid.

### National Statistics.

Last week there was issued by the Government an important return which had been prepared and published on the motion of Mr. Gibson Bowles, M.P. The summary table in this return is as follows:—

	1861.	1881.	1891.	1902.
Population (millions) .. ..	23.9	31.9	37.7	41.9
Death-rate per 1000 .. ..	21.6	18.9	20.2	16.3
Birth-rate .. ..	34.6	33.9	31.4	28.6
Paupers, in and out-door (000 omitted) .. ..	1054	1110	956	1001
Emigrants, British and Irish ..	65,197	243,002	218,507	211,414
Wheat, average price per qr. (480lb.)	55s 4d	45s 4d	37s 0d	28s 1d
Beef, average per stone (8lb.) ..	4s 2d	4s 10½d	4s 0d	4s 0½d
Foreign grain, &c., imports, Colonial produce excluded (000 omitted)	£32,358	£51,852	£52,003	£52,979
Food imports, total (000 omitted) ..	£83,141	£131,673	£138,177	£224,520
Food imports from Colonies (000 omitted) .. ..	£16,655	£30,012	£36,117	£43,516
Food imports, total per head .. ..	£3	£5 4s	£5	£5 8s
Exports, total, in millions .. ..	£160	£297	£303	£349
Exports, British and Irish .. ..	£125	£234	£247	£233
Imports, totals (millions) .. ..	£217	£397	£435	£528
Trade, total per head .. ..	£13	£19 18s	£19 14s	£20 18s
Income-tax yield per penny (000 omitted) .. ..	£11 12	£19 15	£22 38	£25 80 (estimated)
Savings Bank Deposits (000 omitted)	£11,533	£80,535*	£114,484*	£197,105*
British Shipping Tonnage (000 omitted) .. ..	4806	6691	8279	10,054
Bankers' Clearing-House returns (in millions) .. ..	—	£63.7	£38.48	£10,029

\* Excluding investments in Government Stock.

**PUBLICATIONS RECEIVED.**—"The Agricultural Economist," September, 1903. \* \* "City of Boston, U.S.A.) Department of Parks"; twenty-eighth annual report of the Board of Commissioners for the year ending January 31, 1903. This book of sixty pages is wholly concerned with reporting the progress or alterations in the Boston Parks, with tables of expenditure. A few good half-tone illustrations accompany the letterpress. \* \* "The British Inventor," No. 5, September, 1903. \* \* "Agricultural Returns of Great Britain, 1903." This is a copy of the summary tables of the principal crops and live stock in each county of Great Britain in 1903, now in course of distribution to occupiers of land, and will be forwarded to applicants by the Secretary to the Board of Agriculture.

### Hardy Fruit Garden.

**RIPE FRUIT ON WALL TREES.**—Protection in various ways is essential for the well-being of trees carrying ripe fruit. Enemies abound, and will soon destroy, or at least injure and disfigure the choicest specimens. A constant look-out must be kept to thwart the depredations of earwigs, woodlice, and other creeping insects. The earwigs may be trapped in hollow Bean-stalks, folded strips of brown paper, small match-boxes, and similar contrivances, examining them every morning and destroying the pests. Birds are troublesome to Peaches, Nectarines, and Plums as soon as they begin to develop colour and flavour. Protection should be afforded by a covering of small mesh netting. Wasps, though not so numerous this season, may in some places prove annoying. Grapes, Peaches, Nectarines, and Plums may be enclosed in muslin bags to exclude them, also employing a few traps in the form of wide mouthed bottles, three parts filled with sweetened beer and hung about the trees. When sufficiently ripe gather all the fruit. If in perfect condition it will keep some time in a cool fruit room, laying all the soft fruits on a base of wood wool, and covering with tissue paper. Some of the choice late Plums possess good keeping qualities and remain excellent even until they slightly shrivel. Ripe Red Currants on north walls must be netted over as protection, and wet excluded with mats. Choice Apples and Pears must have all the light possible to attain colour, but protected with nets. Gather and store the various varieties as they can be readily detached from the spurs.

**WALL TREES CLEARED OF CROPS.**—More facilities are offered in the disposing of branches and shoots when the trees have been cleared of fruit. Superfluous branches ought to be removed, and it may happen that a number of the principal ones are too crowded, thus spoiling many others. This, then, is a suitable time to thin out, so disposing them that the main branches of trained trees on walls are not closer together than a foot. The presence of the foliage on the trees is a good guide as to distance. Peaches and Nectarines, which bear principally upon young wood, have no use for the shoots after the crop has been cleared, hence these shoots may be cut out, which will give room for the successional to receive the benefit of abundant light and air. Much benefit accrues from a thorough syringing of those trees which are likely to be infested with red spider or aphids. Water applied with the force of a garden engine dislodges them, and the moisture benefits the roots.

**WATERING WALL TREES.**—Lack of moisture is a common cause of poor and indifferent crops, and means should be taken to remedy the matter during the autumn and winter, where it is ascertained that the soil about the roots is deficient in moisture. Dust dry soil must be thoroughly soaked with clear water, and after this apply liquid manure copiously. This will add food to the soil, ready to be appropriated by the fibrous roots. Weakly trees will be improved by the treatment, and those partially exhausted by heavy cropping are recuperated to a great extent. The effects of adequate moisture will be in all cases immediate.

**PREPARATION OF GROUND FOR PLANTING FRUIT TREES.**—This is an important operation, and should not be

delayed until the time for planting arrives. There are many reasons for this, one of the chief being the necessity for freshly disturbed soil to become consolidated to some extent before the trees or bushes are inserted. The question of working in manure depends on the class of fruit to be planted. Apples and Pears and stone fruits require little or no manure adding to the soil. It will cause a strong, sappy, and fruitless growth. Manure when required may be given on the surface. Small bush fruit may, however, have the ground liberally treated with the addition of manure and no unsatisfactory results will follow. The soil should in all cases be made firm. Trench one or two spits deep below the surface spit, being careful not to bring inert, poor subsoil to the surface and bury the comparatively good top soil. The work may be carried out at convenient opportunities during the next few weeks. It will then have become firm enough for planting the trees early in November.

**LIFTING YOUNG TREES.**—While the leaves still remain on the trees the time is opportune to effect the removal of any that are growing too luxuriantly. Preparations should be made to lift and replant quickly, securing a good ball of roots if possible, but shortening back any strong roots, these rooting deeply being the cause of over-luxuriance. Apricots, Peaches, Nectarines, Plums, Cherries, Apples, and Pears may all be dealt with. Firm the ground about the roots, and use no manure, simply good soil of a loamy character. A good watering afterwards will prove beneficial, and a light mulching of manure of a strawy character. In the case of dry, sunny weather following immediately on transplanting freshen the foliage with the syringe, and this will greatly help the trees to retain their foliage for a longer time, and thus encourage new roots to form.—EAST KENT.

### Fruit Forcing.

**PEACHES AND NECTARINES: TREES RIPENING THE FRUIT IN JULY.**—Whenever there are cases of bad setting and stoning of the fruit, lifting the trees when they give indications of falling is desirable, as they respond to it and root-pruning in a satisfactory manner. If the trees are young, have a tendency to late growth, and do not ripen the wood well, a trench may be made for root-pruning in the manner indicated a fortnight ago. Older trees that make strong wood should have the roots wholly or partially lifted and pruned before the leaves have all fallen. Weakly trees, on the other hand, are greatly benefited by the removal of the old soil from over and amongst the roots. Fresh loam, rather strong, with a sixth of old mortar rubbish and a twentieth of wood ashes, answer in place of the soil removed, following with a good watering of weak liquid manure. Where the soil is calcareous, and wood ashes not available, employ steamed bonemeal and sulphate of potash, three parts of the former and one part of the latter, 80lb of the mixture to each cartload or cubic yard of the loam, incorporating thoroughly before placing in the border. Cleanse all the foliage of red spider and brown aphides by water directed with force from a syringe or garden engine, and repeat occasionally. Brown scale, however, cannot be so dislodged, and the other pests, especially brown aphids, only partially so; therefore, apply an insecticide.

**LATE HOUSES.**—The grandest Peaches, as regards size, colour, and quality, are such as Gladstone, Sea Eagle, Comet, and Golden Eagle, Thomas Rivers being a very promising variety, large round, freestone, with a bright red cheek, firm, juicy and full-flavoured flesh. All the late Peaches and Nectarines require generous treatment and liberal supplies of water through the growing season, with no lack of nourishment when the fruit is taking the last swelling, then there is no deficiency of juice and flavour. If the trees are pinched in these respects the fruit will

please the eye, but not satisfy the palate. When the roots find due supplies of liquid the trees and fruit do not suffer, but a rather drier condition of the atmosphere is beneficial when the fruit is ripening. Some soft netting, looped up in small pockets to prevent the fruits bruising each other, is useful to save any fruits falling through ripeness. Thin the shoots, where too crowded. The growths that have borne fruit, not being extensions, should, as soon as the fruit is gathered, be cut out to a successional shoot at the base.—ST. ALBANS.

## THE BEE-KEEPER.

### Driving Bees.

Autumn is the time when driving becomes general. The usual object of the practice of this art is to obtain the honey without destroying the bees. It is only necessary to drive the bees when they are on fixed combs as in skeps. If they are driven at the close of the honey harvest they may be utilised by forming extra stocks or for uniting and strengthening weak colonies. When it has been ascertained that the bees in the skeps are perfectly healthy, it is better to put them on ready built combs. There is, however, no need to join more than two lots together unless they are weak ones. By the time it is necessary to unite for winter, such a colony will have become fairly strong with five or more bars of bees and brood, and if not sufficiently strong to winter alone, will be a valuable addition to a weak stock.

The secret of success in driving is expressed in Langstroth's principle: "The honey bee when filled with honey never volunteers an attack, but acts solely on the defensive." The middle of a fine day is the best time for the operation, and if the skep is left on the old stand until the evening all the flying bees will be captured without loss. The process is as follows:—Puff a little smoke in at the entrance of the skep which it is intended to operate upon, and wait a few minutes to give the bees time to gorge themselves with honey. Now gently lift the hive off its stand and carry it a few yards away and place an empty skep on the stand from which the colony was taken to catch the bees returning from the fields during the operation, and also to prevent them going into the adjacent hives, causing fighting and robbing.

The hive to be driven must now be placed bottom upwards in a bucket, afterwards placing an empty skep over the full one and attaching them at the junction at the back. The ends of the comb should be nearest the operator, so that the bees can run along them and up into the skeps above. Thus arranged, there should be a good part of the two skeps in contact at the back, over which the bees may have their movements expedited if they are disposed to linger by brushing with a feather, or jarring the hive sufficiently to shake the cluster till it breaks. After smoking and properly subduing, there is no danger of the bees flying during the process.

In driving it is necessary to make the combs vibrate until the bees consider them untenable, and this is done by gently tapping with the hands the lower hive, and in a few minutes the bees will begin to run into the upper darkened hive. As the bees will not remain in the new hive without the queen the driver must keep a sharp look out for the queen as she runs into the top storey. The causes of failure in driving bees are generally cold, the absence of a sufficiency of unsealed food, or paucity of bees.

The cold deters a small population from leaving the brood, and bees will not drive until gorged with food, the absence of which unsealed renders them stupid, and instead of running out they fly, or cling to the combs: and a small population makes it possible for them to find a portion of the hive where the vibration is less as against the sides of the hives. By exciting them or warming them up, they may, after they have been subdued by smoking, in cold weather be driven by sprinkling on the bees and combs a little warm syrup. This they will quickly lick up, and they may be driven as merrily as at midsummer.—E. E., Sandbach.

## TO CORRESPONDENTS

\* \* All correspondence relating to editorial matters should be directed to "THE EDITOR," 12, MITRE COURT CHAMBERS, FLEET STREET, LONDON, E.C. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense. In naming plants we only undertake to name species, or well-marked varieties, and only six on any one occasion.

SPOTTED VINE LEAVES (T. T.).—Too late for an answer this week: see next issue.

FLOWERS IN GREENWICH PARK (W. J. M.).—We will be able to use some of the notes in due course.

GOOSEBERRIES UNHEALTHY (A. J. S.).—We think there must be some other reason for the branches dying. The galvanised netting, we presume, does not touch the bushes, but is elevated over them; and, further, if this netting was the cause of the injury we should scarcely expect the Currants to remain healthy in the same quarter. We know of Gooseberry bushes that have been covered with galvanised wire netting for a number of years, and not the slightest injury has resulted, the netting being fixed 6ft from the ground. The soil is perhaps too hot and dry for Gooseberries, and we should mulch it in summer to retain the moisture.

GRASS SEEDS FOR RENOVATING PERMANENT PASTURE (Robesten Walthen).—The most likely Grasses to succeed where there is great drought in summer and heavy rains in winter are *Festuca duriuseula*, *F. ovina*, *F. rubra*, *Cynosurus cristatus*, *Dactylis glomerata*, *Lolium perenne*, *Poa pratensis*, *Phleum pratense*, *Holcus lanatus*, and *H. mollis*, with the leguminous plants *Medicago lupulina*, *Trifolium filiforme*, and *T. repens*. Of Clovers the last-named is most likely to succeed, and of it we should employ 4lb of seed, and the others in proportion as follows:—*Medicago lupulina*, 4lb; *Festuca rubra*, 2lb; *Cynosurus cristatus*, 2lb; *Dactylis glomerata*, *Holcus lanatus*, *H. mollis*, *Phleum pratense*, and *Poa pratensis* each 1lb; *Lolium perenne* being employed alone with those named at the rate of 4lb per acre, or 21lb altogether if the pasture be very bare. If the situation be high add 2lb of *Festuca duriuseula*, and 1lb of *Festuca ovina*.

ASTER PLANTS DESTROYED IN THE STEM (D. W.).—The small white insect to which you allude as eating off the bark of the stem above the surface of the ground we did not discover, but found the bark present, and on its surface a delicate white mould, and this accorded with that causing sleeping disease in Tomatoes. The disease is known as Aster sickness, and has been attributed to attack by a white worm, termed the Aster worm (*Enchytræus parvulus*), but there are many cases of Aster sickness without the presence of the annelid, while in other instances of collapse the white worm is present in the dead tissues, usually between the bark and the wood, hence accompanies rather than induces the decay of the root stem. We consider the fungus the cause of the disease. It is a *Fusarium*. The fungus attacks the root-stem, or at least enters the plant by the root, young plants suddenly going off here and there, and frequently the plants do not succumb until well advanced for flowering or even coming into bloom. Steps should be directed to destroying the fungus in its saprophytic life by dressing the ground with lime or basic cinder phosphate, and kainit. If the ground be dressed with basic cinder phosphate 1lb to 2lb per square yard, and 6oz to 12oz of kainit per square yard, in the autumn, and the ground well dug and forked over in spring once or twice before planting time arrives, it is seldom that the plants suffer from Aster sickness.

There is a possibility, however, of the plants being infected in the seed pan or pricking out box, to guard against which the soil should be sterilised, heating to 180deg and not over 212deg, or mixing with the compost for sowing seed or pricking off 1lb of a mixture of eight parts basic cinder phosphate and three parts kainit to 28lb of compost some time, say six weeks, in advance of sowing, and turning once or twice before use. Dressing the ground with a mixture of air-slaked lime and soot in equal parts by measure, applying  $\frac{1}{2}$ lb of the mixture per square yard and forking in shortly in advance of planting, is also useful, and good against predatory animal and fungoid pests.

The varieties you mention are relatively weaker in constitution than the Victoria and Dwarf varieties, hence more susceptible to contract the disease. It is also supposed that the disease goes over with the seed, but on this point opinions differ, and no satisfactory data is forthcoming.

**BOTHY LIFE: GOOD AND BAD FOREMEN (Hopeful).**—The whole question was debated at some length only a few months ago in our columns. Our advice is: Do your best in all things; and if you think you have cause for complaint, ask, as a man, to state your case before the gardener-in-chief. Insist upon it, and let him be judge.

**THEORETICAL CERTIFICATE OF THE ROYAL HORTICULTURAL SOCIETY (T. T.).**—The secretary of the Society (117, Victoria Street, Westminster, S.W.) will send you full particulars if you apply to him. There is an annual examination in April, at which you are free to sit, and you will get specimen copies of the questions put from the secretary, as addressed above. Watch our advertisement columns for tuitioners by correspondence.

**BOOK ON TABLE DECORATIONS (X. Y. B.).**—Books on this subject are generally only to be had second-hand. We believe there is at least one in preparation for the Press. We have by us several, but the best is one by Mr. William Low, of Euston Gardens, Thetford, who details (and employs wood engravings) his decorations as carried out at Euston for the Duke and Duchess of Grafton. It was published in 1887 by Richard Clay and Sons, London, and is likely enough obtainable.

**DRESSING VINE BORDERS (H. C. C.).**—As a winter dressing to the border we advise a mixture of two parts dissolved bones, dry and crumbling, and one part double sulphate of potash and magnesia (known to the manure dealer as refined kainit, and having a percentage of 48 to 52 per cent. of sulphate of potash or about 26 to 28 per cent. pure potash, and 25 to 30 per cent. sulphate of magnesia, and containing under 2½ per cent. of chlorine, thus showing that the potash and magnesia are practically all in the form of sulphate). Of this mixture 4oz to 8oz may be applied per square yard, and very lightly pointed in. We have found this mixture have a good effect where Hamburgs do not colour well and are given to shanking.

**MUSCAT HAMBURGH GRAPE (Idem).**—The Muscat Hamburgs cracking when about half coloured is probably due to excess of moisture at the roots and of consequent excess of nutrition. The only preventive we have found of any real use has been keeping the Vine relatively dry at the roots, even to the extent of causing the foliage to become very slightly limp, but not to the extent of flagging under the influence of powerful sun, mulching the border with short, dry material, and affording a little ventilation constantly so as to prevent the deposition of moisture on the berries, and a free circulation of air on all favourable occasions. In extreme cases, and when the Vines are extra vigorous, cutting the shoots about half through a few joints below the bunch has a good effect, but the chief thing is dry condition of the atmosphere and soil consistent with the health of the Vine and finish of the Grapes. The cutting half through of the shoots should be done as soon as the berries commence changing colour.

**DISEASED ROSE LEAVES (S. P.).**—The leaves are infected by the Rose rust fungus (*Phragmidium subcorticatum*), which appears in three forms, and all produced on the same host. The æcidia appear in late spring on the leaves and young shoots, forming powdery orange patches, and often cause distortion of the shoots. About midsummer the patches become deeper in colour, owing to the formation of uredospores, and is known as "orange fungus." Finally the teliospores or resting spores are produced as minute black dots on the under surface of the leaves, and is the stage present on your specimens. The appearance of the disease in spring is mainly dependent on the presence of teliospores in the neighbourhood, though sometimes the fungus lives over the winter on affected shoots and produces the uredo stage in spring. It is therefore necessary to collect and burn all fallen leaves in the autumn, though some growers consider burying them deeply in the ground is equally effective. Then, in early spring, before the pruning buds expand, dress the trees thoroughly with a solution of sulphate of copper 2oz, dissolved in three gallons of soft water, applying with a brush or spraying apparatus, coating all the parts with the finest possible film. The spraying is perhaps the best, as the ground is also coated with the solution. If the fungus should afterwards appear spraying with dilute Bordeaux mixture or preferably ammoniacal carbonate of copper solution checks the æcidium and uredo stages, the application being so administered as to wet the under side of the leaves as well as other parts of the bushes.

**NAMES OF PLANTS.**—Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number. (C. A. Rocke).—Yes, *Lysimachia vulgaris*, a poor specimen. (Albyn).—1, *Campanula Mariesi*; 2, *Campanula urticifolia* fl.-pl. (Nettle-leaved C.); 3, *Leycesteria formosa*; 4, *Lathyrus megalanicus*, or Lord Anson's Blue Pea. (W. E.).—*Oncidium Forbesi*. (W. D.).—1, *Kalmia angustifolia*; 2, *Daboica polifolia purpurea*; 3, *Vaccinium corymbosa*; 4, *Pieris (Andromeda) floribunda*; 5, *Isoloma* sp., a much confused genus; 6, a hybrid *Lælia*. (F. J. P.).—1, *Olearia Gunniana*; 2, *Kerria japonica variegata*; 3, unrecognised; 4, *Cytisus Carleri*; 5, *Collutea arborescens*; 6, *Skimmia japonica*.

**NAMES OF FRUITS.**—Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number. (F. Norman).—1, Alfriston; 2, Scarlet Golden Pippin; 3, Reinette Grise; 4, Ribston Pippin. (Devon).—1, Warner's King; 2, Belle de Pontoise; 3, Blenheim Orange; 4, Tower of Glamis; 5, Bismarck; 6, Lord Suffield.

The weather during the greater part of the week was dull and cold, and a heavy fall of rain, accompanied by a rough gale of wind, occurred on the 10th, doing considerable damage to trees, glass, &c.

## The Potato Harvest.

Although we are not independent of foreign supplies as regards early Potatoes, we grow the major portion of our winter supplies; and in favourable seasons we grow practically the whole quantity we need. The quality of British Potatoes is also superior to any others. The German and Belgian tubers only compete with our second qualities, whilst almost every year consignments of fine English and Scotch are shipped to America to be sold as luxuries.

The acreage under Potatoes has largely increased during the last twenty years, farmers having perforce been allowed greater freedom of cultivation, and the crop is now without doubt the most valuable and important one we have. It is also of the greatest interest to the working man. The millions in large cities who are always living from day to day without resources, know only too well and quickly when the home Potato crop has met with disaster, and feel acutely the consequent increase of price. The farm labourer benefits greatly through the great demands which it makes on the labour market, and we say without fear of contradiction that the Potato growing districts are the most prosperous in the country. We refer only to rural districts, of course.

The Potato harvest commences generally late in September, but October generally includes the bulk of the work. As soon as the skin of the Potato is quite fast, the sooner lifting takes place the better. If we wait for the whole of the haulm to die off, we may miss excellent spells of fine weather, and it is important that the tubers should be stored dry, especially if they are intended for late keeping. A good supply of dry Wheat straw must be in readiness before work begins, so that there may be no delay in getting the pies covered and made safe.

Small plots of Potatoes are lifted with a fork, and there is no more thorough way, but it is slow and expensive, and quite useless in the case of large areas. The Potato plough is still the general implement. The spinning machine or digger is also common in some parts, but has not made much progress of late. At one time we quite thought that these machines would supersede the plough; but when Potatoes are large these rotatory forks are liable to break and bruise them, and the introduction of Up-to-Date and similar large varieties has tended to the retention of the older fashioned implement. Our own experience of both is in favour of the digger, especially if men cannot be obtained to do the picking up; for after the plough the sides of the furrow must be scratched down, work which children cannot do and women object to. If there is life left in the haulm the Potatoes are disinclined to part from it, and must be shaken off. In such a case very few are left in the ground. Diggers move the whole ridge, and leave all the tubers on, or near, the surface. If they never damaged the sample they would be very valuable.

Any fourth standard child could pick after a digger, but school regulations forbid it. In some parts the school holidays are fixed so as to include October, but the school staff object to have their holiday so late, and they have reason on their side. We suggest that all children over twelve years of age, having put in 350 attendances during the previous school year, should be qualified for a labour certificate for the month of October. Many farmers already are restricted to a small acreage of Potatoes by the scarcity of hands for picking, and until someone invents a machine with hands the difficulty will increase.\* Women do not work in fields as they once did, and every man is wanted for other work. Irish labourers at present fill up the gap, but the call for their services is so great that they command their own price. At one time they did the work for 17s. per acre; now they can obtain 24s.

Having got our digger, or plough, and the necessary hands, we shall want baskets to pick into. Oval wicker baskets holding about 21lb are generally used, and they can

be bought for about 1s. each; but we prefer a scuttle-shaped basket, costing about 15s. per dozen. They are made with wire plaited into them, which keeps them stiff, and makes them more durable. They hold about the same quantity as the baskets, but are much easier to empty, which is a great advantage. A man who has emptied scuttles into carts would find emptying baskets much harder work. Each picker will require at least two baskets, and there should be a supply in reserve. Some growers who send away second early Potatoes in five-peck hampers, having a handy supply of the latter, use them for gathering the main crops. Each picker has a hamper set down conveniently near, into which he empties his basket when full. Two men come round with a cart, into which they empty the hampers. This system is only suitable where the plough goes round in the same way as a digger, and only two rows are open at once. Where Irishmen are employed a number of alternate ridges are opened, and the men work in line, each in his own row, with a cart following behind. The drawback to this system lies in the danger that a sudden downpour of rain may find a large quantity of Potatoes exposed.

Potato "pies," or "clamps," vary in width from 6ft to 9ft. Seven feet 6in to 8ft we think wide enough. If there is much disease, do not exceed 7ft. To make a good job, prepare long batts of Wheat straw about 6in or 7in thick, and tied tightly with straw bands at every foot or 14in. Lay two of these down lengthwise, 7ft apart, and shoot the Potatoes between them. These batts may be continued for any length, and the pie kept the right width without trouble. The batts keep the Potatoes from slipping out at the foot, and make it much easier to get the ridge well up. This is desirable, for the sharper the pitch, the less likely will it be for wet to penetrate the straw.

The batts are a great safeguard against frost, for the portion of the pie near the ground is specially liable to be penetrated. It is along the foot that an extra thickness of straw is required, and the batts ensure this. The Wheat straw must be put on as straight and as much like thatch as possible, on each side, covering the batts well; then a light covering of soil, say 3in to within 12in of the ridge. Then a capping of straw over the ridge, the ends being fastened with soil. After any resulting sweat is over, another 4in of soil over all will complete the work.

## Work on the Home Farm.

The weather being still very unsettled, harvest progresses slowly. Very little corn is uncut and a fair quantity of Wheat is in stack, but all the Oats and the greater part of the Barley are still out. We have heard the threshing machine to-day for the first time this season, but have not a report of the yield. We note that new Wheat is not meeting a ready sale, at least according to market reports. This is probably owing to poor condition, for very little can have been got really dry enough for immediate threshing. If farmers can hold off until their Wheat is fit to thresh there should be a good market for it. With a drop in the acreage of 144,000 acres, English Wheat must be scarce.

A neighbouring farmer has got all in except twelve acres, and is thin-furrowing stubbles. He is to be envied and copied, for he is a very early sower, and it is a case of early sow, early mow. These are the men who make farming successful. He prefers ploughs to cultivators for breaking up stubbles, but his land is on the heavy side, and wonderfully clean. He offered his labourers £1 for each barrowload of twitch they could find on his land the other day, but none have started collecting it.

Potatoes are dying off quickly. The spot on the leaf is spreading rapidly, and in some fields the leaf is nearly all gone. All kinds are affected, and without a spell of fine weather disease must make a serious attack upon them. The Potatoes will certainly be ready for lifting before the end of the month.

There is plenty of work before us at present. Many annual weeds have shown themselves amongst the Swedes and late Turnips, and they will all have to be looked over, so there will not be much time for hedge trimming, which is often done in September, or for autumn fallowing, even if the weather should be suitable for it. Rye for green spring food and tares for early summer use will soon require sowing, but the land must first be ploughed, and for tares will want manuring first. It is good land which will grow tares without manure. On clean stubble a good stirring with the cultivator might make a fair seed-bed for Rye, but it is slipshod farming, and the real saving a doubtful one.

Sheep will shortly be very dear. Lambs are doing better generally, and here are above the average. Dairy cows are scarce and dear, but other cattle, both fat and store, are cheaper.

\* In a part of Dumfries-shire, last year, a school was closed specially that the children might be free to assist at the Potato harvest.—ED.

# Barter's WILD GARDEN BULBS.

OUR SELECTION OF  
DWARF - GROWING INDIGENOUS  
AND OTHER BULBS,

Adapted for Rockeries, Sloping Banks,  
Odd Corners, and Naturalization.

CONTAINS

**1,100 Fine Bulbs. Price 21/- nett.**

Sent Packing and Carriage Free on receipt of remittance.

100 Aconites	100 Blue Grape Hyacinths
100 Blue Bells	50 White Grape Hyacinths
50 White Bells	50 Feather Hyacinths
100 Star of Bethlehem	50 Chionodoxas
100 Fritillarias, mixed	50 Allium Moly
100 Snowdrops	50 Dogtooth Violets
100 Triteleias	25 Anemone Fulgens
50 Snowflakes	25 Anemone Apennina

Half the quantity, price 11/6. Packing and carriage free.

**Carters Wonder Box of Bulbs**, containing  
1,000 Hyacinths, Tulips, Narcissus, &c., price 21/-

THURSDAY, SEPTEMBER 24, 1903.

### Root Pruning.

THE question is often asked, Is it really necessary to prune the roots of fruit trees? The answer must be in the affirmative. In many cases it is the only thing that can be done to bring some trees into a fruit bearing condition. There are gardeners who maintain that it is unnecessary, and say, "Crop a tree well, then root-pruning will not be needed." But what about trees that will not bear fruit?

The most favourable time for this operation is during the months of October and November; the earlier it can be safely performed the better it is for the trees. Some four years since I root-pruned three Pear trees in the month of January, but two of them had hard work to recover. When a root is pruned in a proper manner, a callus is formed on the face of the wound, and from this the roots are emitted. When the pruning is done early, the soil will be in a warm state, and new fibrous roots will be made before winter.

It may be asked, How shall we know when root-pruning is required? I say by the condition of your trees. All fruit trees must make a certain amount of growth to keep them in a healthy state, and for the bringing to perfection a crop of fruit. But it sometimes happens that some trees, especially young ones, will have a tendency to make too much growth, at the expense of bearing fruit. This is especially noticeable when much manure is used, or if planted in rich soil. If the annual growths much exceed 12in in length, and very little or no fruit is produced, it will then be necessary to root prune to bring the tree to a bearing condition. Root pruning checks overgrowth, equalises the balance of strength between root and branches, and hastens and heightens the fruitfulness of trees. Fruit

READERS are requested to send notices of Gardening Appointments or Notes of Horticultural Interest, intimations of Meetings, Queries, and all Articles for Publication, officially to "THE EDITOR," at 12, Mitre Court Chambers, Fleet Street, London, E.C., and to no other person and to no other address.

trees that are allowed to grow more or less as they like, as in the case of standards, will not require root-pruning; but with trees that are restricted in size, as wall trees, pyramids, open bushes, and other forms, it will often be found necessary.

Varieties of Apples that are naturally free fruiting, such as Lane's Prince Albert, New Hawthornden, Lord Grosvenor, Devonshire Quarrenden, and others, will scarcely ever require root-pruning. Stone fruit, as a rule, require more attention to this matter than do Pears or Apples, Apples, perhaps, the least of all. Some are under the impression that root-pruning takes up so much time, and hint that they have quite enough to get the top pruned. This is false economy, for when a tree is properly root-pruned it will greatly lessen the need for branch pruning; not for one year only, but for several. One is sometimes asked what to do with old trees on walls that have not fruited for years. These may be improved in some cases, but unless it is the wish of the owner to have the trees preserved, which is sometimes the case, the better plan would be to take them out and replant young trees in their place. It can scarcely be expected that old and exhausted trees can be brought into a very satisfactory fruiting condition. Then there is the risk as to whether they may be good varieties.

When root-pruning, a trench must first be taken out at a given distance from the stem of the tree. This will depend upon the age and size of the specimen dealt with. A tree three or four years planted about 2ft or a little more will be all that is required. But 3ft or 4ft should be allowed for larger trees. It is always best to have plenty of room, because one can always work as near to the stem of the tree as may be required and considered safe. Indeed, with some young trees it is even a better plan to carefully lift and replant. With pyramids or bushes half of the tree may be done one year, and the other half subsequently. The trench must be taken out wide enough for a man to comfortably work in, and deep enough to get as low as the roots are likely to go. All the soil should be taken out, leaving the trench quite clear. A fork is often recommended for removing the soil from the roots, but many of them will be broken. I find it much better to have a light one-sided pick, with a handle about 3ft long; this can be more conveniently worked, not being so clumsy as a fork.

The soil must be carefully picked out from between the roots down into the trench, and thrown out from time to time, so that a clear working space may be kept. All roots of a fibrous nature should be preserved; they may be turned back toward the stem of the tree, and kept in position by a lump or two of soil. Sometimes they may be loosely tied to some of the strong roots. When young trees are operated on the soil may be removed fairly close up to the stem. An important point to bear in mind is that there are no roots left that are pushing straight down. This is rather a difficult matter with some kinds of trees. The thick roots should be cut well back to different lengths, a sharp knife being best for this purpose. It is best to cut in an upward direction, so that the new roots may ramify in a horizontal direction.

In returning the soil it should be made firm, and the roots carefully spread out at different levels as the work proceeds. It is a good plan to add some burnt soil, wood ashes, and bonemeal to the staple soil, which will greatly assist the trees. With Plums, indeed all stone fruit, and especially in non-calcareous soils, old lime or mortar rubbish should be used, and the whole made very firm. It may seem to some rather a long process, but a couple of men used to the work will get a number of trees done during the day.—J. S. U.

## Autumn Thoughts.

Can one realise that, to all intents and purposes, the active part of the year is over, and that the great scene shifter is now ringing up the curtain for "The passing smiles of autumn"? Yet it is so, and over the gardening world steals a feeling, not of rest, but of restfulness; and not of satisfaction, yet one of anticipation for better things to come, for at the dying embers of disappointment the torch of hope is rekindled to guide on into the unknown—the unfathomable future. As autumn passes with all the pomp and pageantry of an almost unearthly beauty in its train, gardeners, of all men, surely, who live so much in com-

munion with Nature, can feel some sympathy in the hard hand of the great, yet capricious, mistress to whom they minister ere the icy grip of winter enforces rugged realities, and incites to more prosaic work.

There is no lack of work now; may be said. That is so. And there is but small comfort in contemplating the effects of the passing year. That may be so. Yet who can look upon their immediate surroundings without feeling a stimulating hopefulness that the comparative barrenness of the year is again pregnant with possibilities for another season; or fail to feel that power which lies in the ministering hand to promote that desired result? Nature is always busy in some shape or form, and has many little surprises in store.

In our own immediate sphere of work we are to some extent prepared to meet the latter, or should be; and it is generally admitted that much of the erratic activity she displays is amenable to control if a prescient knowledge of what should be done and the energy to do it obtains. There is, truly, but little pleasure in looking back now; there is some pleasure in looking forward at this particular season; and, probably, in gardening, as in most other phases of life, most of our pleasures and the keenest of them are anticipatory.

In speaking of autumn as a period of restfulness the term is comparative only. The hurry and rush of the year has gone, but much remains to be done, and the vital necessity of doing it without delay cannot be too strongly impressed. Nature is quieter, certainly, and there is a spirit of quietness prevailing over this early period of the passing year which penetrates the soul of the worker, bringing him so closely in touch with it as to make this autumn work very enjoyable. Never was outside growth more active than in this year, nor was there ever greater evidence of misdirected natural force than is now to be seen. The less fruit the more woody growth, and in some old-world gardens the season has been conducive to a mild luxuriance, which bodes ill for future prospects unless vigorous measures are promptly taken to admit all possible air and light ere it is too late to derive their full benefit. It is not only in the customary "breast" pruning of wall trees and normal thinning of bushes that claims attention, but after an extraordinary season measures should be employed judiciously to gain the end in view.

In the glass department much may now be done to promote those happy conditions conducive to rest during the dull, short days of winter. A general overhauling of stove and greenhouse plants, and a general cleaning of both plants and pots, and re-arrangement of the permanent occupants with all the additional room that can be given to them by the removal of Caladiums and similar things to winter quarters in the background, may at once be done; anything, in fact, to avoid even a suspicion of overcrowding, if that is possible, will well repay the labour or even sacrifice that common sense prompts. Possible?

Of course some will say such preaching is vain, and that their houses get more blocked at this time than any other. That is so. Yet it is not rarely the case that a lot of useless stuff is held over to be eventually thrown out, and the grower may well take second thought now over the matter than defer it until spring. Fire heat, not higher temperatures; ventilation, not draughts; and the removal of temporary or discontinuance of permanent shading, are small things which mean much now and more hereafter.

As with the plant houses so with the fruit houses. There are many examples of the evils of overcrowding amongst Vines and Peaches, particularly amongst the latter; and where the removal of canes (thinning out) or spurs in the vineries has been determined upon, their prompt excision whilst atmospheric conditions still keep foliage and roots active is obviously worth more than a passing thought. Why so many lay in and tie down such an abundance of superfluous growth the Peach is capable of making in a season it is not easy to understand, the more so as the custom, which it appears to be, is useless labour—nay, worse than useless. However, that mistaken policy leads further back than these remarks are intended to do. The bulk of bearing wood can now be removed with distinct advantage to the current year's growth. It is now the time when next year's bearing wood fairly revels in autumn sunshine, if it can get it, and future prospects lie in this maturation if prevailing conditions allow it to obtain.

Outside, our theme might be prolonged and extended indefinitely, for it is not alone applicable to the fruit bearers first mentioned, but the ethics of free trade in light, air, and such sunshine as may be vouchsafed to us in declining days includes nearly, if not all that we wish to pass, not only comfortably through the possible ordeals a winter may bring, but with stored up energy enjoy that rest which means renewed vitality and productiveness in its turn. It is an old, old story, oft repeated, always wanted, and worthier of being more deeply graven on the mental tablets of this gardening generation than lies within the pen power of—A. N. OLDHEAD.

KYLEMORE CASTLE.—The Duke of Manchester has purchased Kylemore Castle and the estate of 13,000 acres for £63,000. The estate is in the heart of Connemara, and the castle has several times been assigned by rumour as a probable Royal residence.

**Cattleya x Pittiana, Wilson-Potter's variety.**

The flower received a first-class certificate on September 1. Our figure on this page is a very true likeness of the flower, with its wavy petals of a tawny brown colour, and reddish flush. The lip broadens in front, and is rich mauve-purple.

**Dendrobium Phalaenopsis.**

This magnificent Orchid is now about to flower on this season's growths. Everything should be done to get them developed. Water must be given till after flowering, and no shading is necessary.

**The Week's Cultural Notes.**

A constant supply of fresh air is one of the most necessary details in Orchid culture just between the seasons, as at present it is apt to be neglected. Thinking to economise fire, perhaps the ventilators at the bottom of the house will be closed and kept closed during the night, but this is not economy by any means. Beside robbing the plants of the necessary air, it causes the moisture to condense on the glass and from there to fall upon the plants, cold chilling drip that does more harm in an hour than can be put right in a year. Many fine specimens of Phalaenopsis and Angræcum have been lost owing to this icy cold moisture falling into the centre of growth.

During the summer and well into the autumn a little air should be put on top and bottom a couple of hours after closing time, a nice fresh feeling in the morning resulting from this. Even in winter a chink of air below at least should be allowed even in the warm houses, while in the intermediate and cool structure a little top air must be allowed except in the very coldest nights, always providing, of course, that the heating apparatus is capable of keeping the correct temperature without overheating the pipes. This is important, hot pipes causing a dry atmosphere and very unpleasant smell injurious to the plants.

In the cool house the plants will be taking on that rusty appearance that only comes from cool airy conditions, and it is a pleasure to work among them. Foliage that is hard and rustling, instead of flabby and pale green, is a sure sign of health and a forerunner of plentiful flowering. Just as the plants have been repotted or surfaced, a slightly closer atmosphere may be given for a few days to re-establish them, but when this has not been done the autumn air, laden with moisture as it often is at night, must be fully and freely admitted. As long as the temperature ranges somewhere between 55deg. and 60deg. as a minimum none of the Odontoglossums, cool Oncidiums, Disas, Lycastes, and the general run of alpine Orchids will take any harm.

September is getting well on, and towards its end frosts are sure to occur, consequently all Orchids outside must be placed under cover, the semi-hardy kinds, such as Bletia hyacinthina, being left until last. The deciduous Dendrobiums may still be left in a sunny frame. They are hardier than generally supposed, and rest more surely and flower more freely from having a good airing now. The evergreen kinds are better in the house, but these, again, must be cool and fairly dry, though not sufficiently so at the roots to cause the pseudo-bulbs to shrivel.—H. R. R.

**Cyclamen Culture.**

Cyclamens are now cultivated more extensively than ever. Flowering as they do throughout the winter, they help to fill the gap between the last of the Chrysanthemums and the first of the bulbs. The old method of growing Cyclamens was to grow the corms year after year. When the plants had finished flowering they were dried off, and after being rested for a time were shaken out, repotted, and started again. This method is still in vogue, although not on such a large scale as previously.

The system generally adopted now is to grow the plants without a check from the seedling to the flowering stage each year. Sow the seed at the latter end of August in well-drained pans. Good drainage is an essential factor from start to finish for the successful cultivation of Cyclamens. The seed should be sown thinly and evenly over the surface of the soil, pressed in, and covered lightly with fine soil. Cover the pans over with glass, and place in a cool frame to germinate. Remove the glass covering as soon as the seedlings appear above the soil, and raise the pans up to the glass to prevent them from getting drawn. So soon as the plants can be handled prick them off into other pans filled with a similar compost, and keep the plants growing in a night temperature of 50deg., rising to 60deg. in the day until the new year.

In January pot them off singly into 2in. and 3in. pots, according to the size of the plants. For potting use two parts loam and one of leaf soil, adding sufficient charcoal and broken lime scraps to make the soil porous. The lime scraps are used instead of sand. Cyclamens root with exceptional freedom where they are employed. As the roots of the Cyclamens emanate from the base of the corms only, a good half of the latter should be above the soil when the potting is finished. A great mistake is made in completely, or nearly so, covering the corms with soil, as, apart from causing them to rot, it encourages a disease which sometimes attacks the plants, and failure is the result.

At this stage, in particular, care must be taken not to allow the soil to become dry, for if that occurs the bulb will become hard, and it will be some time ere it commences to grow again. Maintain a moist atmosphere in the house or frame wherein the plants are growing, and syringe them lightly during bright weather. By the middle of April the plants will require a shift into large 60-size pots. The weather by this time should be favourable enough to admit of the plants being put out into cold frames, which should be filled up with ashes, so that when the plants are placed on them they will be quite near to the glass. Keep the frame closed for a few days, and then air may be admitted when required, and shade lightly from bright sunshine.

Towards the end of June the plants will have filled the pots with roots, and will require potting into 48's

and 32's, in which they will flower. Use the same compost for potting, and pot firmly. Keep them close for a day or two after potting, and then gradually increase the amount of air. Syringe the plants morning and afternoon during bright weather. From July to September remove the lights at night time when the weather is favourable.

Cyclamen are very apt to throw up adventitious flower buds, and these must be pulled out as they appear. Turn the plants round occasionally to promote an even balance of growth on all sides, and where a large number of plants are grown it is advisable to divide them into batches; the first coming in the middle of October, the others being brought on as required. Afford the plants weak manure water as soon as they show the flower buds on the crown of the bulb.—G. R., Waddesdon.

**Cattleya x Pittiana, Wilson-Potter's var.**

#### A New Eremurus.

Under the name of *Eremurus Himrob*, M. Van Tubergen, horticulteur à Haarlem, has put into commerce a new variety of this Liliacée, the issue of *E. Himalaicus* x *E. robustus*, hence the compound name Him. rob! The foliage is that of *Himalaicus*, and hardier than *robustus*, the flowers resembling *Elwesianus*, but are clearer.

#### Commercial Culture of Hyacinths.

We have the privilege to reproduce an illustration of one of Messrs. Toogood and Son's Hyacinth fields, as grown for them in Holland. The photograph (page 286) speaks for itself; the irrigation channel down the centre is sometimes necessary in such dry porous soils. The bulbs, of course, are grown in beds, each bed containing many thousands of bulbs, and all of one variety.

#### The Water Hyacinth in American Rivers.

A successful method for destroying the Water Hyacinth (*Echornea*) which seriously obstructs navigation in southern rivers of North America, has been tried on the St. John's, where some wharves have been abandoned because of it, according to the Boston "Transcript." A boat filled with a laboratory and force-pump sprays a swath 90ft wide with a chemical which causes them to die at the roots.

#### A "Friendship Garden."

Sir William Harcourt is an enthusiastic gardener. At Malwood, says a contemporary, where his estate comprises only twenty-five acres, he has devoted four to his garden—a beautiful and carefully-kept retreat, across the green swards of which peacocks strut proudly, as though conscious of the Royal descent of their owner. A feature of the retreat is the "Friendship Garden," in which trees planted by old friends are growing. The garden was commenced in 1890, when the first Oak was planted by Mr. Gladstone and the first Elm by Mrs. Gladstone.

#### Allium Neapolitanum.

There are a number of species of *Allium*, but the most useful for greenhouse cultivation is *Allium neapolitanum*. The flowers, which are borne in heads or umbels, are of the purest white. The bulbs are easily forced, so that they can be had in bloom early, and at a time when white flowers are sought after for various purposes. Place the bulbs in 4½ in or 5 in pots, 1½ in apart, and 2 in deep, in a sandy mixture of loam, leaf soil, and sand. Plunge the pots under ashes until growth begins, after which place in a cool greenhouse, and allow them to come gradually into bloom.—E.

#### Beautiful Asters.

On September 15, Mr. Amos Perry, of the Hardy Plant Farm, Winchmore Hill, London, N., sent us bunches of perennial Asters, and his splendid form of *Geum Heldreichi*, that seems to improve on acquaintance. The following letter accompanies the flowers: "I herewith send you a few flowers of my new *Geum Heldreichi* superba. This is without a doubt one of the best new hardy plants introduced during the last two or three years. It is now in full flower with me, and will remain so until the frost sets in. It has been flowering since the first week in May, and is of a pretty, neat habit, with flower stems well thrown up above the foliage, and lasts some time cut. Its delightful colour will make it a very popular plant. Aster, Perry's White, is without a question the finest white Aster up to date. It is quite distinct, with its pretty loose petals reminding one of a Japanese *Chrysanthemum*. It is of a pretty, neat erect habit. Aster Elsie Perry is the best pink variety introduced up to the present. It is a seedling I raised here some three or four years ago, and which received an Award of Merit at the R.H.S. last year. The flower is a clear rosy pink. I also enclose a few flowers of my new double pink Aster. I have several very promising double ones which I hope to show before the R.H.S." [The flowers are in each case all that is claimed for them.—ED.]

#### Nepenthes x picturata.

The following shows the genealogy of a beautiful and handsome new Pitcher plant possessed by Messrs. J. Veitch and Sons, Ltd., Chelsea.

#### The New Iceland Poppies.

In August, Messrs. Storrie and Storrie, of Dundee, sent the following letter with a delightful bunch of pale pink, rose, carmine and tea-coloured Iceland Poppies: "We send you herewith a few blooms of our new strain of Iceland Poppies, which was certificated by the R.H.S. in June last. We hope to send you a larger bunch later on, when the possibilities of seed production are spent; but, meantime, we think you will admire the delicate shades and harmonies of these new colours."

#### A New Disease of Turnips.

A new disease of Turnips was discovered in Lincolnshire in the early part of this year. It is caused by a fungus of the genus *Phoma*, which is not yet defined, but which is very infectious and closely allied to that which has caused great destruction to Mangolds. Although it does not appear (says the "Nottingham Guardian") to have been seen as yet anywhere except in Lincolnshire, it is very desirable that vigorous steps should be taken to prevent its spreading, and, therefore, the Royal Agricultural Society has done useful service by issuing a little leaflet, by its consulting botanist, Mr. William Carruthers, F.R.S., in which some very practical advice on the subject is given to growers. Farmers are warned to be on the watch against the disease during the present Turnip season. It appears that no possible treatment can get rid of the fungus when it has once got possession of the roots of the Turnip or Mangold. The only thing to be done is to prevent the spread of the disease by removing the affected roots from the field before the ripe spores escape into the air. On the assumption that the fungus reaches the Turnip through the leaves, the foliage should be sprayed in the autumn with dissolved sulphate of copper, or, better still, with a Bordeaux mixture, made up of 12lb of sulphate of copper, 9lb of quicklime, and 100 gallons of water. This is an operation that should be performed at once.

#### Our Fruit Supplies.

If the season had been at all favourable the wholesale salesmen in the Birmingham market would have been receiving daily at the present time at least a thousand pots each containing 72lb of English Plums, whereas recently there was scarcely an English Plum on the market. The Dutch and German Plums are brought across the water to Hull, from which port they are consigned to all the great distributing centres. Birmingham get its full share, and the Plums of the best quality were selling at 3s. to 3s. 6d. a sieve of 24lb, while the inferior sorts were disposed of at from 2s. down to 9d. a sieve. Of late, the Apples from Italy and Spain have been in demand in the absence of English but on the 20th there were far more home-grown Apples in the market than a month ago, with the result that the demand for the foreign fruit was considerably curtailed. The price for English Apples was 6s. to 12s. per pot of 64lb, according to quality. The Italian Apples arrive in chips containing 18lb, and they were sold at from 2s. 3d. to 2s. 9d. per chip, a marked reduction on the 5s. a chip, which was readily given a few weeks back. The Spanish Apples are selling at 8s. to 11s. per case of 84lb, whereas a month ago the price was nearly double. The season for American Apples is commencing, and the consignments already received are in capital condition. It is expected that the Apple crop in Canada will be plentiful, and that the supplies in the English markets will last well into the new year, when the Australian season will begin. A few English Melons were on sale at from 1s. 3d. to 2s. 6d. each, but the greatest supply was from Valencia. The Spanish Melons were sold at from 6s. 6d. to 8s. per case, each containing twenty-four or thirty-six; but the best class of Valencias sold freely at 9s. to 10s. 6d per case. These Valencia Melons are of very fine quality. Each Melon is wrapped in tinted paper.

## Some Typical Gardens.

### VIII.—The Blind Man's Allotment.

Imagine, if you can, a piece of ground, rectangular in shape, about twenty square rods in extent, surrounded by wire netting, and differing only in the way in which it is cropped from a number of others in the same field, and you have the example that I have selected for the purpose of bringing this series of sketches to a conclusion. As I have stated in the headline, it is not only an allotment, but a blind man's allotment, and is cultivated by an individual to whom day is the same as night, as a hard fate robbed him many years ago of one of the greatest of earthly blessings—eyesight. Naturally, then, I shall be forgiven if I wander a little from my task of describing the garden to discuss the gardener, who is an actual living being, and, though lowly in estate, is to my mind a striking figure in the world of horticulture.

With his own lips this poor blind man told me that his twenty rod allotment had been his salvation in more respects than one. Blindness came to him when he was too old to learn any trade, and he stood in danger of going melancholy from the need of something to occupy his mind. In the days when he enjoyed his eyesight he had a taste for gardening, which fortunately did not leave him, and he found in his plot that solace which he could not get elsewhere. So perfect has practice made him in his various operations, that some narrow-minded, suspicious persons have been heard to suspect that he can really see, and the blindness is a sham; but knowing better, as I do, I will let that pass for what it is worth.

A stout stick is the man's constant companion. With it he feels his way to and from the allotment, and by its aid he works about his various crops. For more than twenty minutes at a stretch I have watched him, but without revealing my presence, engaged in such an intricate operation, for a blind man, as thinning Onions. Every moment I expected to see his foot go on to the row or a plant come out that should be left in the ground. But old blind Richard is too expert at Onion thinning for that. His fingers move among the plants with lightning-like rapidity in feeling over the seedlings to determine their character, and measuring distances. He seems to have a special touch for weeds, and never did I see him pass one over. In fact, to watch him is a wonderful illustration of the capacity of a blind man, and I can only assume that with the loss of his eyesight his sense of touch has grown more acute.

It would seem also that Richard's sense of imagination has also developed, for on several occasions after making my presence known to him he has invited me to walk round the plot with him, while he has discussed the various crops, just as any person might who was endowed with all his faculties.

"There's a row of Peas, not looking so bad, are they? What do you think of those Beans? Onions are doing well, aren't they?" These are a sample of Richard's remarks; while he has stopped before some crop that did not look so well as it might, and remarked dolefully on its appearance. As he feels his way along the path that runs the whole length of the allotment, Richard has no guide but his own memory and imagination to aid him in the location of the various crops; yet I never knew him to make a mistake. He has an "eye" for beauty, too, for at the top end of the plot he has a bed of simple garden flowers, which he genuinely admires, and were not the sight so pitiable it would be amusing to see a blind man turn up a Carnation or some other flower and remark upon its character and form.

"Now, Richard," I once remarked, "you can't really see all this, then how does it appear to you?"

"No, I can't see it with my eyes," answered the man, a tear trickling down his furrowed cheek, "and yet in a way I can. My whole plot is in front of me, almost as clearly as if I could really see it, and I know as well as could be where every plant is, and how it is doing. I don't know how it is, except that I go over the ground a goodish many times."

This is quite true, and it is a touching sight to watch the man when engaged in the work of planting or sowing. He takes the line of wire netting at the end of the plot as his starting point, and then, by means of lines and numerous measuring pegs, he sets out the rows, going over the ground time after time, before he is satisfied that every-

thing is correct. I may say, however, that so accurate is his judgment that from one end of the plot to the other every row of crop is parallel to its neighbour, perfectly straight, and quite square with the shape of the ground. This speaks volumes for a man who cannot see his hand before him.

Nor is blind Richard only an ordinary everyday sort of allotment gardener, for he is a leading light in the local gardening society, and secures a fair share of prizes at the monthly meetings and the annual show. He is close to the top of the list of prizewinners every season for the cleanest and best cropped allotment in the parish, and without any special favours at the hands of the judges, for Richard would not care to win on those terms, but prefers to start level with his neighbours and trust to his own gardening skill to bring him out somewhere in the front rank. One thing that Richard has at his disposal is time, for his blindness prevents him following any occupation, and it may safely be said that his allotment is his hobby, companion, and friend; in short, it forms the greater part of his life, and it is a standing joke amongst the rest of the plot holders that there is no fear of birds of any kind doing much damage to the crops, because Richard is always there.

In his gardening operations the blind man is not without friends, one of whom presented him with the wire netting to surround his plot, because the rabbits were such a plague to him. Another helps him with manure, a third with seeds, and there are several persons in the village who buy Richard's produce when he has any to dispose of; so that, as he puts it himself, "he manages to grub along one way or another, and keeps outside the workhouse."

Such is my concluding type of garden and gardener, and if the presentation of it does nothing more, it gives an illustration of the subtle power of the gentle art of horticulture, which can bring a ray of light and solace to a poor afflicted creature whose life, hard as it must be now, would otherwise be all darkness.—A BRITISH RUSTIC.

[This is the concluding article under this heading.—ED.]

## Retarded Lily of the Valley.

It cannot be denied that the originator of the system of retarding the various bulbs, roots, and plants conferred an inestimable boon both on the flower-loving public, and on those made responsible for a winter and spring display for decorative and other purposes. It is only too clearly remembered what futile attempts have been made with home-grown and purchased roots with a view to force them into early growth in past times. Those so grown, too, were bereft of the natural foil which their own foliage supply, and Valley Lilies are not much without foliage.

The forcing of these ever-favoured flowers now becomes a very simple matter. A warm greenhouse will, in the space of from two to three weeks, afford a display of these delightful flowers in numbers and effect consistent with the extent of purchase. That they are more expensive to purchase is a fact that justifies the thought, for the cost of upkeep and the investment of retarding plant must be borne by those for whom it is provided. The certainty of result, however, together with the production of such finely developed leaves and flower spikes, makes the cost appear much less, and except for late spring use I should neither adopt nor advise the purchase of any but retarded roots. Those Journal readers who have refrained from purchase of these retarded Lilies have no idea what a welcome change over and above the natural root is thus effected.

The point so much in their favour is simplicity of culture, and this is one that should appeal to the amateur and gardener not well provisioned with forcing houses and pits. Forcing, as this is usually understood, is not at all necessary, because a greenhouse temperature will bring them on—more slowly, of course, than a warmer house will do.

Another point of value following this cooler conditioned culture is that they last so much longer either for room adornment or the smaller stages of the conservatory than the hard-forced pot. The crowns are so well selected that rarely does there appear a flowerless growth. The investment, therefore, combines a profitable as well as a pleasurable aspect that cannot afford long to remain unrealised and untried by every class of cultivator.—W. STRUGNELL.

"SYMPATHY" IN PLANTS.—A week ago we observed in Wm. Paul's nursery a batch of *Populus argentea* growing next to the golden Canadian variety. The former were all tinged with yellow.

### The Climbing Varieties.

(Concluded from page 174.)

Nowadays this section is much more sought after than formerly. Pergolas, arches, and poles are so much more in evidence in gardens that a list of varieties specially adapted for this purpose may be of service to intending planters.

Crimson Rambler still holds the place as the most gorgeous Rose in existence. It is difficult to plant this Rose out of place, except at the foot of a south wall, where it does not succeed owing to red spider attacking it. Growing over a rustic arch, up a pole backed by evergreen shrubs, or in front of a specimen golden Yew, or allowed to grow in a natural manner on grass, are the ideal spots for this Rose.

Aglaia is a disappointing Rose to those who do not understand its requirements, as until it is established and thinly trained it fails to flower abundantly. When it does, its appearance is simply magnificent, smothered as it is by a full crop of pale yellow blossoms in clusters.

Céline Forestier is not now planted as much as its merits deserve. Given a south wall or another sunny spot, and liberal treatment at the roots, then abundance of its light yellow blossoms would be forthcoming.

Ards Rover is seldom seen; no Rose that I know of gives more pleasing blooms. The colour—crimson-shaded maroon—is pleasing, while it has a perfume all its own. In growth it is vigorous, carrying large deep green leaves. Claire Jacquier, for a pergola, is unequalled where a mass of nankeen yellow is required.

Dorothy Perkins is quite an autumn flowering Rose, and all the more valuable in consequence. The small double rose pink flowers are produced in large clusters, most sweetly scented. The growth is vigorous, making shoots twelve feet long in a season. This Rose is said to be of American origin, and has, I should say, some Wichuraiana blood in it.

Félicite Perpétué, for freedom of growth and flower, is quite one of the finest of climbing Roses. Planted at the foot of a south wall and allowed to ramble away at will is an ideal way of cultivating this variety. Over a pergola, tree, stem, pole, or arch, in any aspect, this Rose is a gem. The small flowers are produced in huge clusters, and are white, with a faint flush of pink.

Mdme. Alfred Carrière is a good pillar Rose, giving shapely blossoms—white with a flush of yellow at the base of the petals. Noella Nabonnand has rich, velvety crimson, semi-double flowers, most beautiful in bud and gorgeous when fully expanded. Its growth is vigorous.

Psyche is a pale rosy pink, suffused at the base of the petals with salmon and yellow; a free flowering variety, and capitally adapted for a pergola or pole.

Queen Alexandra is best described as a rose-coloured form of Crimson Rambler, from which it is a seedling. Reine Olga de Wurtemberg is semi-double in form, having vivid red blooms.

The Wallflower is a desirable Rose, flowering most abundantly, rosy lake crimson in colour.

Thalia, or White Rambler, is a pure white free flowering variety worthy of extended cultivation. Waltham Climber No. 3 is a vigorous growing variety, producing large deep crimson blossoms quite freely.

Paul's New Tea Rambler promises to be an acquisition. The colour is so attractive—salmon pink, heavily suffused with a coppery sheen. The flowers are small, quite shapely, and abundantly produced.

Climbing Mrs. Grant is a sport from that popular Rose, Mrs. W. J. Grant, and is characteristic of that variety in every way except growth. The blooms are most shapely; colour, salmon pink.

England's Glory may best be described as a pink Gloire de Dijon. Alister Stella Gray is a glorious pillar Rose, flowering quite late, rendering it all the more valuable; white with yellow centre.

Lamarque, where a southern wall can be given it, is quite one of the best climbing Roses. The flowers are produced in clusters. When in bud the colour is pure white; fully expanded blooms have a cream or yellow centre.

The Garland has huge bunches of small semi-double flowers, nankeen and pink, which change to white. Fellenberg has crimson lake flowers, which are freely produced; a good variety for a pole or tree stem.—E. MOLYNEUX.

### Rose, Morning Glow.

This we saw in Wm. Paul and Son's nursery at Waltham Cross on September 16, giving a grand account of itself. The flowers are bright rosy crimson, suffused with orange; it is dwarf, vigorous, and very floriferous.

## Cucumber Culture for Market.

(Concluded from page 103.)

The question is often asked whether it is better to grow two crops in one season or let one planting run right through. A house that is planted, say, the middle of February, or after, is better let run through the season. I can generally get more Cucumbers with one planting than if I planted twice. I find it best to cut all the old wood out of them about June; and by giving them a good thinning out, they will then make a lot of fresh growth with a bit of coaxing and feeding, and in a short time be practically a new house, and will throw some first-class fruit.

In giving air to "Cues" the temperature of the external atmosphere must be taken into consideration, as the lower this is, the greater care is necessary in its admission. I find during March and April, before you have got them shaded, it is better to air them early, say between eight and nine o'clock if it is likely to be a hot day: just a crack about this time; and increase a bit later in the morning. This saves them from scorching, which checks them considerably. I never shade until I am obliged to, and then only just sufficient to stop the glare of the sun. After shading you should reduce the air, only opening the ventilators after the thermometer has reached 85deg.

Cucumbers should be closed up early in the afternoon, always give them a good damp down, and close up by half-past three o'clock. In applying water there is one rule to be observed, and that is: water only when necessary, applying such a quantity as will soak the whole mass of the soil. I have known cases where it is a rule to water every morning and damp down a stated number of times per day, regardless of the outside weather conditions; and the plants receive a soaking at the roots at equally regular intervals with a supreme indifference as to whether they require it or not, until the soil becomes sodden and sour, resulting in the inevitable decay of the roots and consequent inability of the plants any longer to produce first rate fruit. It is wise, therefore, to be careful in the application of water to the roots of the plants, for, depend upon it, more failures are brought about by the excessive use of this than from all other causes put together. It is better to closely examine the beds before watering, and if the plants require watering, perform the operation; but a good deal depends upon the weather, for sometimes two waterings per week will be found sufficient; other times they will require three or four waterings.

### Disease and Pests.

Cucumber disease, commonly called "gumming," sometimes attacks the plants, and there is no cure for it. The origin and cause are very obscure. There are two things which I believe are most likely to cause it; they are bad drainage, and watering with the water at too low a temperature. Should anyone be so unlucky as to get disease in the house, the best plan is to root-out the plants, and after cleaning the house thoroughly, make a fresh start with new plants and soil. This is the only safe plan, and the sole one I can recommend. Green fly and thrip can both be exterminated by fumigating.

Red spider is one of the worst enemies the Cucumber grower has to contend with. Dryness at the roots, and where atmosphere is not kept sufficiently moist, will give cause for the pest. There are several fumigators on the market that guarantee to kill, but I have failed to find one as yet without doing serious harm to the foliage. My plan with red spider is to apply clean water plentifully through a fine-roset syringe, morning and evening. This is repeated for about a week, and the air kept surcharged with moisture will clear them off. Woodlice do injury in some cases, but, as a rule, it is not of much moment unless the insects are very numerous, in which case they must be cleared off as soon as possible. The best plan is to stop the drainage holes in some flower pots, and place a piece of boiled Parsnip or Potato at the bottom of each, and then fill up lightly with some moss or hay. Take up the pots first thing in the morning and empty the contents into a pail of boiling water. Follow this up, and you will soon clear them out. Wireworm being occasionally present in the loam, and causing much injury to the plants by feeding on the roots, a close inspection of the soil before it is used is necessary. If on examination you find it contains the wireworms you must either break the soil up into small pieces, and thoroughly examine it, or bake the soil until it is too hot to handle. No preparation will destroy wireworm without being injurious to the plants.

Mildew is induced by a dull, stagnant atmosphere. Its prevention is easier than its cure, as, with a proper amount of air, mildew will be absent. If it should appear, the best remedy is to get some flowers of sulphur and make it into a thin paste; then spread it on the hot water pipes. This, with a fair amount of air, will soon dry off the mildew.

Careful selection as to the size of marketed fruit is necessary, for, while small fruit is small priced, that which is large and coarse is of still less value. "Cues" from a foot to 18in in length are the most remunerative, as they sell freely at a fair price; while longer ones, if in fine condition, obtain relatively higher

prices, but do not sell so freely, and the most prolific varieties exist amongst the shorter fruited kinds. A "Cue" from a foot to 18in in length does not exhaust the plants so much as a longer one: thus more can be grown in a given space.

The four best varieties for market purposes are Western Wonder, Masters' Prolific, Tender-and-True, and Cardiff Castle, the latter being the best of the four. In conclusion, I will say that the quality of the produce must be first-class; and its condition when unpacked in the market must be the same, as only the best articles obtain the highest prices. They should be packed tight, so that they will not shift about in the flats. As I mentioned before, the better the fruit looks, the higher prices it will obtain, and in all market work appearance is really as important as quality.—(Read before the Cardiff Gardeners' Association on February 24, by Mr. WALLER, Cucumber grower to Messrs. Nurton and Co., Dynas Powis, Glamorgan.)

## Shelter Hedges.

Not only shelter hedges, but hedges for ornament as well; and the purpose of the illustration which accompanies these notes is to draw attention, ere the planting season begins, and plans have

## Gadding and Gathering.

Richard Smith & Co., Worcester.

Worcester is a quiet little town, at the present time undergoing a transition from the horse tram-car system of transit, to an electrified one. The township lies in the midst of a fertile country, in the valley of the Severn, the Malvern Hills being in sight south-westerly; and within twenty or thirty miles are the renowned fruit lands of Evesham (southward); Shakespeare's birthplace to eastward; and Warwick, Birmingham, Dudley, and Kidderminster northwardly. The county of Worcester is like Cromartyshire in Scotland in this, that many of its parts are quite detached from the main area, and are surrounded by other shires; yet they are fragments of Worcestershire. The mineral springs and brine baths of Droitwich, a few miles from the county town, have a European reputation.

So much for a general statement; and now for a few notes on Richard Smith and Co.'s nurseries, a name known everywhere. The visit to which these notes pertain was only of one hour's duration, which enabled one to see only the hardy plants and some of the shrubs.

*Elæagnus aurea variegata* was pointed out as being one of the shrubs for which a brisk demand has been made. The *Elæag-*

Sheltering Yew Hedges and Grass Walk.

been made—to draw attention to the cosy, clothed effect produced by Yew hedges. They are always clean, and are not, to our knowledge, subject to blights or insect pests. They do get dusty, and may catch soot in smoky districts, but on the whole the Yew is one of the best ornamental hedge plants we have. Planted a foot and a half apart, in a well-dug soil (almost any soil will suit the Yew) the plants speedily establish themselves, and make rapid growth. They need hardly be touched with the shears for three years; but when they have interlaced and are becoming thick-set, the lateral growths may be shorn evenly in. This will be continued annually afterwards. It is well to cut pretty hard at first, in order to get a good centre to the hedge. A mulch of short dung is very beneficial. On dry, poor soils the Yew sometimes dies unexpectedly, but generous treatment can do much to prevent this. With a double-lined hedge, and borders for "old and new fashioned" hardy plants, the most fitting path is a grass one: a firm sward.

nuses are ornamental, showy, and not deciduous, so that a place can always be found for them. Another subject of much grace is the cut-leaved weeping Birch, of which some lovely trees of a mature age were noticed in Messrs. Smith's grounds. Their weeping Beech near the offices is quite a specimen figure, and is widely known. A figure of it appears in the firm's catalogue of general nursery stock.

While writing of the arborescent members, it is fitting to allude to certain Bamboos, including amongst them the following:

*Phyllostachys Marliacea*, which is a beautiful subject, making 8ft to 9ft of growth in a season at Worcester. It is said to be rare.

*Arundinaria nobilis* and *Simoni*, forming handsome, feathery, irregular masses 10ft high.

*Phyllostachys sulphurea*, having bright golden yellow stems, slender reed-like growth, and narrow light green foliage. The stock of this is limited and valuable.

*Phyllostachys heterocycla*, another slender kind, is also rare.

*Phyllostachys Castillonis*, a robust plant, and very beautiful at St. John's Nurseries, was other to which attention was directed. Some of these are grown in tubs and pots under glass, while many of the hardier sorts flourish in the open-air collection. For those who may wish a list of these plants, I print from Cook's book on "Trees and Shrubs" the following,

**LARGE AND HEAVY PEACHES.**—A large Peach was lately exhibited at McKinney, Tex., measuring 13in and weighing 13oz. Dr. Trimble, of Duplex, twelve miles north of there, exhibited a Peach which measured 13in in circumference and weighed exactly 14oz.

which have proved the hardiest and most ornamental at Kew: *Phyllostachys Henonis*, *P. viridi-glaucescens*, *P. flexuosa*, *P. nigra*, *P. boryana*, *P. sulphurea*, *P. Marliacæa*, *P. ruscifolia*, *P. Castillonis*, *Arundinaria nitida*, *A. japonica*, *A. auricoma*, *A. fastuosa*, *A. Simoni*, *A. Fortunei*, *A. anceps*, *A. Hindsi* var. *graminea*, *Bambusa palmata*, *B. tessellata*, and *B. marmorea*.

*Solanum crispum* is a trifle tender I believe; but where it succeeds, such as in the Bath Botanic Garden, it is undoubtedly a charming subject. The clustered flowers are pale lavender-blue, and the bush has a close furnished habit of growth. Against a wall it does well in less favoured districts. Also of a shrubby nature is the Southernwood or American Sage (*Santolina viridis*), a huge plant of which all but covered one of the rockery mounds here. The flowers are mere yellow disks, like so many golden balls held forth on green stakes. The plant, of course, is odorous, like others of its kind.

Passing by one of the numerous hedges which serve as divisions to the brakes and shelter screens as well, a glorious show was furnished by the Flame-flower, *Tropæolum speciosum*. The roots are set on the north side, the growth running through the hedge, climbing up and flowering on the south side. The hedge is *Thuja Lobbi*.

The *Eryngiums* are a host in themselves, and one of the best of them is the true *amethystinum*. *Oliverianum* (*amethystinum* of some) lasts better than *alpinum*, which has lighter bracts than the foregoing. *E. planum* grows 18in high, and has white and blue stems. The rounded blue inflorescences are numerous borne. Lastly, we may note *E. Bourgati*, growing to 2ft., and has beautiful light blue bracts, making it certainly one of the finest.

*Platycodon grandiflorum album* will be prized by all who know or grow the blue form. It is rather scarce, therefore all the more valuable. Somewhat in the same line is the double white flowered nettle-leaved *Campanula*, which, I feel sure, is less grown than its merits warrant. It is a real good border plant. One of the best of the *Rudbeckias*, too, is *maxima*, with long "cones" and yellow ray petals. Altogether it is very handsome.

To mention another plant of much refined beauty, and hitherto overlooked, one need but name *Digitalis ferruginea*, one of the Foxgloves. The tubes are of a peculiar, quiet, greyish brown, the lip or front of each being pure white, and as the plant grows 2ft high this would make a pretty addition to vases or glasses of cut flowers. It flowers in July and August.

The Snow Queen variety of *Lupinus arboreus* is one of the best shrubby border plants we have had during recent years, and some

There are the crimson berried spikes of *Actæa spicata*, a fine subject, with foliage like *Spiræa japonica*. *Prunella Webbiana* has handsome rosy flowers, making it valuable along with the purple-blue type. *Ligularia* (*Senecio*) *thyrsoides*, with its Cabbage-like leaves and handsome flowers, is another capital wild garden plant. *Chrysanthemum leucanthemum lacustre* seems to be an improved form of *latifolia*. It is taller, and has handsome, pure white flowers, and robust growth. *Cimicifuga racemosa* is a favourite everywhere, and is a distinctive plant.

In *Campanulas*, apart from those more generally seen, attention was claimed for *C. Bononiensis* and *C. alliarifolia*, the latter with leaves like a Burdock, and has drooping white flowers 1½in long, borne in long racemes at the ends of the shoots. The first named has bluish-violet flowers in long racemes.

*Anthericum graminifolium* is graceful, and *Oenothera speciosa* is showy. *Statice Bonduelli* is a yellow biennial "Sea Lavender," sometimes grown in pots for spring use in conservatories. Then we have *Chelone latifolia* or *Pentstemon pubescens*; and the true *Helianthus mollis*, together with *Achillea* "Snowball," and the blue *Delphinium formosum* *Belladonna*, are each very choice hardy border plants.

In a concluding sentence one must name *Tunica Saxifraga*, pink flowers like those of a *Claytonia* or small *Dianthus*, and foliage resembling *Nierembergia*; also *Salvia virgata* and *S. argentea*. All departments of nursery stock, from trees and shrubs and fruits, to tender exotics under glass, are grown extensively by Richard Smith and Co.—WANDERING WILLIE.

## Jottings for Decorators.

The floral embellishments in many large private houses are now often carried out on a most extensive scale, too much so for the peace of mind of many a struggling gardener, who is trying to accomplish great things with the moderate facilities at command. Under the most favourable circumstances it is not an easy matter to hit upon new ideas, or to find materials of the right description to carry them out successfully. One great essential, if not the greatest essential, in connection with decorative work, that it must possess elements of boldness if it is to achieve more than passing notice. The huge trumpet-shaped vases often used in entrance halls and large rooms, are capable of contributing the necessary boldness, provided they are well arranged with suitable materials; but they are too often dressed with a total disregard to proportion, and few things look more incongruous than to see a big vase supporting an arrangement of flowers and foliage, so insignificant in size and devoid of striking effect, as to make the vase appear far more prominent than the decorations.

I have no doubt that all of us sometimes err in this direction, not through being unaware of the weakness, but because suitable materials are not always at command. The lake, pond, or river bank will, at this season of the year, and onward through the autumn months, help many out of such difficulties, as Reeds and Rushes of every description—especially the Reed Mace, wrongly called the Bullrush—are splendidly adapted for such work. I have, however, quite recently become convinced that, with very little trouble, gardeners generally might increase their stock of materials suitable for supplying boldness to their decorative work. Not nearly enough use is made of the various varieties of Maize, and by growing good batches in pots and in the open ground splendid materials would be secured during the summer and autumn months. *Zea japonica*, and its variegated form are often used for bedding purposes; both might, with advantage, be largely grown in pots; but what I find to be still better is the strong growing flat-seeded Maize.

About the end of last April I obtained a few seeds from a corndealer, and planted them in a narrow border against the back wall of a greenhouse. By the aid of plenty of water and liberal feeding the resulting plants grew grandly throughout the summer, and now they range from 8ft to 10ft in height, all crowned with feathery plumes, and form some of the finest material I have ever seen for giving boldness to decorative work. Some of them will soon play a prominent part in harvest festival decorations. If cut close to the ground, and the cut stems are plunged at once into water, they will be splendidly adapted for arranging in large vases, or in groups of plants. Just at the present time, when large Russian Sunflowers are plentiful, these might be cut with stalks from 3ft to 6ft in length, and arranged in a trumpet vase with a single plant of Indian Corn

Commercial Culture of Hyacinths. (See page 282.)

Toogood and Sons.

fine samples were seen here. *Dianthus Walkeri* and *D. coronaria alba* are both gems of their types; while *Potentilla Hopwoodiana*, a lovely variety (hybrid?), with quantities of salmon-pink flowers, was much admired and chosen from amongst others. *Potentilla veveana* is also a telling sort, having brilliant orange-scarlet flowers. *Phygelius capensis* is good in its way, with drooping crimson flowers, and is fairly well known.

While referring to *Rudbeckia maxima* I omitted to notice *R. hirta*, which flowers a month earlier than *R. speciosa*; and *R. digitata* and *triloba*, each of which are very good.

One might go on for a long time naming hardy plant gems from the St. John's Nurseries, but these notes are already becoming lengthy. Brief references must suffice for what remains.

rising above them, and common *Asparagus* intermixed, also long trails of *Ampelopsis* beneath, would then form an object of striking beauty.

In arranging the noble corn stems among groups of plants, the ends should be inserted in large wide-mouthed bottles filled with water; the bottles could then be easily hid by the surrounding plants, and if necessary, moss could be packed in firmly to keep the stems in position. A little later on when giant blooms of *Chrysanthemums* are, for the time, the kings of our gardens, the stately Maize plants would be fitting companions to associate with them in filling large vases, or in groups of plants. In fact, the uses to which such bold materials may be put are so numerous that the busy decorator would welcome them in large quantities. The great point is to have them when wanted; and those who lack them now should provide a supply for next year by sowing successional batches of Maize seeds next spring, and growing some of the plants in a sheltered position in the open air, others in pots, and a few in odd corners of glass houses, where they may be planted in borders, and will give but little trouble.—ONWARD.

[The following are useful for large vases perhaps not often enough requisitioned: Golden Cut-leaved Elder, golden and purple *Corylus* or Hazel-nut; yellow forms of the Elm; *Prunus* *Pissardi*; *Berberis* in sorts; *Rosa* *rubrifolia*, *Physalis* *Alkekengi*, Snow-berry, golden reticulated Honeysuckle, and variegated Vine.]

## Sir William Chambers.

Sir William Chambers, of Scottish parentage, was born in Sweden in 1726, but came to England when only two years old, and was placed at Ripon School. On arriving at manhood he became supercargo of a Swedish East India ship, and made one voyage in that capacity to China. On his return he commenced the study of architecture under the patronage of Lord Bute, by whose interest he was appointed drawing master to the Prince of Wales, afterwards George III. His first architectural erection was a villa for the Earl of Besborough at Roehampton. He was afterwards employed in laying out the Royal Gardens at Kew, where he introduced the Chinese ornaments. In 1771 he was invested with the Swedish order of the Polar Star. He became a Fellow of the Royal and Antiquarian Societies.

In 1775 he was appointed to conduct the erection of Somerset House, being Architect to the King, Surveyor General to the Board of Works, and Treasurer to the Royal Academy. In 1758 his style of design, &c., was severely attacked in two satires termed "An Heroic Epistle," and "An Heroic Postscript of Sir W. Chambers." In that Heroic Epistle is observed that "he teaches us that a perfect garden must contain within itself all the amusements of a great city; that *urbs in rure*, not *rus in urbe*, is the thing which an improver of true taste ought to aim at."

The volume which entitles him to our notice is entitled "Plans, Elevations, Sections, and Perspective Views of the Gardens and Buildings at Kew in Surrey, the Seat of H.R.H. the Princess Dowager of Wales. 1763." In the introductory description of the plates is mentioned that Mr. Kent designed some of the ceilings and chimney-pieces. Sir William remarks that "the situation of the gardens is not advantageous, as it is low and commands no prospects.. Originally the ground was a dead flat, the soil in general barren and without either wood or water. What was once a desert is now an Eden. The judgment with which art has been employed to supply defects of nature and to cover its deformities hath very justly gained universal admiration. The orangery or greenhouse design is mine, and was built under my inspection in the year 1761. The physic or exotic garden was begun in 1760. For the cultivation of the plants I have built several stoves." The thirty-ninth plate is of the aviary and flower garden. Sir William Chambers died March 7, 1796, at his house in Norton Street, London, and was buried in Poet's Corner, Westminster Abbey.

## Bedding in London Parks.

(Continued from page 210.)

The following notes are a continuation of the descriptions of Hampton Court bedding:—

3. Another bed, 27ft long by 15ft broad, had *La Fayette* Begonia a foot apart all over, with two dozen plants of Gardeners' Garter (*Arundo* *Lindleyana*); the same number of *Eulalia gracillima*; while all over the surface, between the Begonias, was the wiry, grey-skinned *Lencophyton* *Browni*. The edging was *Abutilon megallanicus*, otherwise called *A. vexillarium*, the latter pegged down. This was at once a simple, yet brilliant bed.

4. Foliage and flowering bed (27ft by 15ft). This was filled with *Abutilon vexillarium* as standards, 5ft and 6ft high, bearing flowers. Beneath these were *Salvia* *Horminum* and Mrs. Pollock *Pelargonum*, edged with *Antennaria*.

5. *Koehia seoparia* and *Centaurea candidissima* were used in another bed similar in all its other features to the foregoing. The *Koehia* is very neat, and its pea-green colour is beautiful; but the plants must be maintained small, else they get too formal and dumpy.

6. Foliage and flowering bed (27ft by 15ft). There were twenty-one *Fuehsia gracilis*, of bushy, floriferous character; also *Arundo* *Lindleyana*, and a good toning of *Begonia semperflorans atro-purpurea* (chocolate leaved) above a dense white carpet of *Koniga maritima*, the Sweet Alyssum, and edged with *Echeveria*.

1726—Sir William Chambers—1796.

7. Circular bed (12ft diameter). This had double crimson tuberous Begonias, yellow *Celosia pyramidalis*, and *Arundo* *Lindleyana*, the surface being carpeted with *Mesembryanthemum*.

8. Salmon-apricot coloured double tuberous Begonias over a carpeting of *Mesembryanthemum*, and having dot plants of *Eulalia gracillima*, the whole edged with *Abutilon vexillarium*, was exceedingly rich and fine. This was certainly one of the finest beds. The Begonias were a selected strain, all coloured apricot, or apricot-salmon and carmine.

9. *Lobelia fulgens* and *Gaura Lindheimeri* over Harrison's Musk, was very graceful and highly effective. So, too, was the large bed (20yds long) filled with *Tritomas* or Red-hot Pokers, *Montbretias*, and *Galtonia candicans*. Then, again, bushy, pyramidal plants of *Veronica Andersoni variegata* over *Verbena venosa* and *V. ericoides erecta* (white), was good. A few *Abutilon Thompsoni* plants, and the broad edging of *Stellaria repens*, gave added effect. *Anemone japonica* above Blue Bell Viola, is perfection.

### Regent's Park.

Under the superintendence of Mr. A. D. Webster, who succeeds Mr. Jordan (now in charge at Hyde Park), the many frequenters of this fashionable park have every reason to feel thoroughly satisfied with the bedding arrangements of this season. Perhaps in colour contrasts some alterations for the better might be effected, but the season has been of the worst description possible for effective bedding.

Regent's Park boasts one very large bed of Cactaceous plants imposingly grouped. In it are Aloes—huge plants towering high upon eminences, and having smaller samples of their kin at their base and round about them. *Sedum glaucum* and *Lotus Jacobaea* are two of the carpeting plants used all over the surface. *Yucca filamentosa variegata* stands out here and there, as do plants of *Echinocacti*; while the bays and interspaces are devoted to *Kleinia repens*, *Pachyphyton rosea* and *Mesembryanthemum cordifolium variegatum*. *Echeveria metallica* and *Sedum tabulaeforme* are placed in places best suited for them; these are large plants of their type.

A narrow border of *Nicotiana affinis* with small slender plants of *Fuehsia virgata* (finer than *F. Riccartoni*), and thirdly, a sprinkling of crimson *Celosia pyramidalis*, is worthy of note. A similar narrow border, in fact, a yard wide, and backed by a dwarf hedge, contains a back line of *Dracenas*, set 6ft apart, the interspaces having bushy plants of *Veronica Andersoni variegata*, the undulating front line being of variegated *Dactylis* or Cocks-foot Grass, mixed with rosy everflowering Begonias (*B. semperflorans*), and a margin of Bluebell Viola. This is very pretty.—D.

# Impney Hall, Droitwich.

Sometimes the garden makes the gardener; generally the gardener makes the garden. By his effort or want of effort, so is the garden rich or poor, well dressed or ill, beautiful and plentiful in its products and features, or otherwise. Impney is a garden where the man in charge makes the impress of his assiduity apparent in many ways. He cultivates well; he cultivates intensively. The walls of the Muscat vinery afford an illustration, for they are clothed with cordon Pears, a thing not to be seen once in a hundred places; and if the reader will follow these notes to their conclusion, he will find that the most is made of the available space and materials.

The estate, if not very extensive, is well planned, and has charming features. Impney Hall is a beautiful mansion built of ornamental red brick and creamy sandstone, in turreted style, with Grecian angles, giving it an air of elegance and grace that pleases everyone. The powers of the architect had been further exercised at the time of erection in 1875, by carrying out his plan to form a handsome terrace, surrounded by an ornamental wall, and having flights of steps, a forecourt, and a lovely fountain and statuettes within its area. This terrace is on the west front, and furnishes the best scenic view of the park, and a wooded eminence named Pidzer Hill, that culminates the scene about half a mile in front. This little verdant Oak covered hill, rising 500ft, gives much character to the immediate environs, and is well known locally. Between the hill and the terrace lies an ornamental sheet of placid water, whose sinuous shore is suitably planted. With wood, lake, park, deer, and plenty of enlivening bird life, the surroundings are very pleasant.

## The Terrace Garden.

The prettily designed walls of the terrace are laden with Crimson Rambler Roses, whose floriferousness could certainly not have been surpassed. Finding that the stone of which the wall is built was not weathering well, but was likely to crumble rapidly, Mr. Corbett, the owner, had it covered with the close-growing Ampelopsis, whose growth is now ensnathing the material, and so protecting it. Along the top of the same wall are fixed marble sculptures of the head and busts of twelve or fifteen Roman generals, statesmen, and emperors. The terrace parterre is nicely bedded in the conventional manner; and in keeping with the strictly formal scheme are the upright Yews and shrubs dotted here and there. This western front altogether is of rich interest in a number of ways.

The kept grounds contain some shapely Wellingtonias and Cedruses, and the single line of the former that skirt the outer limit on one side of the fruit and vegetable garden, are most imposing and exceedingly handsome. Between them and the garden wall (outside the latter) there are magnificent hardy plant borders (separated by a central path), whose great feature at the season of my visit was the bold groups of Spiræa Aruncus, and the standard plants of William Allan Richardson Rose. Pæonies in the early summer, Dahlias and Delphiniums later, together with Pinks, Stocks, Pyrethrums, Asters, and many other of the best subjects of the English flower border, were here noticeable. The verge is of grass, is kept in prime condition. Some Cupressus macrocarpa trees, 20ft high, in line with the fruit room and offices, were good of their kind, but Impney is not famous for its coniferous or its flowering trees.

## The Indoor Fernery.

The indoor Fernery is, however, something to wonder at, and few similar places are to be found in gardens. Another large and notable indoor fernery is at Woodside, near Paisley, in Renfrewshire; and elsewhere one finds a small construction, generally the work of Pulliam, London; but our view on the opposite page shows the Impney house to be of considerable dimensions, and possessed of large Tree Ferns. The view is only a small corner of it, and indeed, one man is kept employed in the house practically the whole year through.

Originally a disused gravel pit close to the mansion, it was transformed to what it now is, in 1890. The house is 150ft long by 60ft wide. It is approached by rugged steps, planted with hardy Ferns, Ivies, and other plants; but a more private entrance is from the hall, through a grotto to the fernery. The building is heated by a powerful boiler 150yds away, and the six 6in pipes are hidden by built-up rockwork. The rocks, caves, steps, and bridges are formed with tufa stone brought from Matlock Bath, and about 200 tons were used. The water enters dripping at a cave in one end, and runs in a winding stream the whole length

of the house, golden carp luxuriating here. In suitable places there are seats, and the whole structure is electrically lighted. When the building was completed Mr. Corbett imported fifty Tree Ferns from New Zealand, and there are, of course, a considerable variety of other Ferns and plants.

## The Glass Houses.

The progress of these notes has now brought us to the plant houses, a brief review of which, and a look at the kitchen garden, will conclude this summary survey. The glass ranges are in good keeping, and their contents are meritorious throughout. Fruit is a leading feature, and Mr. Jordan, the gardener, yearly secures some of the leading awards at the greater English shows, as close Journal readers may have noticed. Strawberries to the number of 1,800 are forced annually, and Strawberries entail much labour ere they yield their crops. The variety employed is Royal Sovereign.

Melons and Tomatoes are plentiful, and the variety of Tomato named Worcester Prolific, which is a new one of Richard Smith and Co.'s, crops heavily, and has nice shapely fruits; while of the Melons we find Royalty, British Queen, and Frogmore Orange each in favour. The latter is recommended as a good early scarlet fleshed. It is worthy to be recorded that no less than eleven batches of Melons are planted each year, the first cutting being about April 30, and the last at the end of the present month. The earliest batches are grown in pots, and only one fruit is taken from each plant.

Though there is no special pit for Pines, just as there is no orchard house for pot fruit trees, yet the gardener at Impney manages to cultivate both sections: the Pines in the centre of a plant stove, and the pot fruits in the peacheries and vineries, placing them at the front of the house, beyond the trellis, for the sake of the greater light. The Pines were heavy and even, some of the Queens weighing the respectable figure, 6½lbs; and Smooth Cayennes 1lb heavier. The side stages of this house contain shapely, clean, and brilliant Crotons.

## Pines and Bananas.

One feels disconsolate on reflecting that Pine culture is so little attempted nowadays, notwithstanding a plentiful market supply of cheap fruits; for the latter will never taste so well as those from one's own pits and houses. In order to give the younger men the necessary cultural hints, the *Journal of Horticulture* still supplies occasional "Jottings on Pines," and in this connection it deserves well at the hands of gardeners.

Then, again, there are the Bananas, a plant of which has been figured in these pages bearing the enormous crop of 100lbs, or 256 "fingers." These are small plants in small pots, and a great deal of space is certainly not necessary for the successful culture of this nutritious fruit. In what I will call Vinery No. 2, there are seventeen varieties of Grapes; yet the crops are highly satisfactory, and the Vines in good condition. Diamond Jubilee Grape is being discarded because of its inferior flavour. It is a robust grower, however, and therefore may please some, and in "American Gardening" I notice that a man who has "studied" it for two years says he considers it one of the finest black Grapes ever introduced. Five years ago he inarched it on Canon Hall Muscat. There are four vineries, also Peach and Fig houses.

The greenhouse contained the usual class of plants, and I think there is room in many gardens for greater diversity, and the lists of plants tried at Kew, which the papers publish from time to time, ought to be of service in this respect. Francoas, Trachelium oeruleum, Humea elegans (silvery form), and Lilium speciosum among other things, were remarkably fine. In a top range the Zonal Pelargoniums were as fine a sight as a traveller could regale his visual sense upon, and the varieties are up to date. Probably Phœna is not well known, and I name it in case that be. It is of the Jacoby stamp, with enormous trusses. Ian Hamilton is another gem. And while the "Geraniums" are respected and treated as they deserve to be, the Gloxinias from Sutton's and Veitch's seed strains, are another pride of the Impney garden; and, thirdly, there is a most excellent collection of Cyclamens. The Gloxinias are sown in July, and wintered in small pots, which saves trouble in the spring. The Cyclamens, I should note, are plunged in ashes, in cold frames, and in July they were 6in to 8in across the foliage, so that ere the spring they will furnish grand plants. The new Coleus thyrsoides, and Kalanchoe Kirki are among the novelties doing well.

Lastly, one must note that sweet rosy-flowered plant Chironia

linoides or ixifera, which was beginning to flower, and will continue for a long time. This is the pink flower used by Mr. Goodacre on his decorated dessert table at Shrewsbury this year, for which purpose it is excellently fitted. Mr. Jordan strikes cuttings in March; he grows them on until October, when the plants are given 4½ in pots. They are grown cool all winter, and are at the flowering stage by July.

The kitchen and hardy quarters are trim; though fruit in the Droitwich district, and all over Worcestershire, as elsewhere, is almost entirely absent this year. Mulching for both fruit and vegetables is largely (and heavily) practised, even the prize Onion bed having its dressing. Through the kitchen garden one is led to a most charming rosery full of decorative varieties, and a long line of the dwarf pink Gloire des Polyanthes was at once pleasing and telling. The Rose garden is, indeed, a very fine one, though

Sow the seed in shallow boxes or pans the first week in March, and place in a warm house to germinate. Prick off into boxes, or pot singly in small pots as soon as they can be handled, and keep in a warm house near the glass. Pot on into 54's when ready, and put them out into a cold frame; keep close for a few days, and thin gradually; harden them off.

Towards the end of June they will need a shift into 32's, and when they have recovered from the check received in potting stand them outside on ashes. Up to this stage the soil used for potting should be two parts loam and one of leaf soil, but at the next and final potting substitute dried cow manure for the leaf soil. The last potting into ten and twelve-inch pots should be done early in September, so that the plants will be well established ere the winter arrives.

During the winter the only protection they require is from

Indoor Fernery, Impney, Droitwich.

simple, being but two borders with a grass walk severing them. The planting and choice of varieties had been originally carefully accomplished. Thus end the notes of Mr. Corbett's fine garden, one of the best in a county of great gardens, second to no others in England.—J. H. D.

### *Campanula pyramidalis.*

When preparing the seed-list for the ensuing year, do not omit to order a packet of seed of this charming plant. It is invaluable for filling in the gap which occurs in most places when the major part of the summer-flowering plants are over and before the Chrysanthemums come in. Formed into a group by themselves, or dotted in among other plants in the conservatory, they are equally effective.

the rains, and if a frame is available in which to place them, so much the better. Admit plenty of air, both at the top and the bottom—the latter by raising the frame on bricks—except during very cold weather. Remove the lights on all favourable occasions; in March they may be stood outside again.

As the season advances and the plants begin to take water freely, it is advisable to plunge the pots in ashes; for, if the plants are allowed to become dry very often, they soon begin to lose their foliage, and by the time they are in bloom are entirely devoid of leaves.

Campanulas, to bring them to perfection, require a great amount of feeding. Commence giving manure water as soon as the flower-spikes begin to appear; apply it weak at first, and then gradually increase the strength. Continue to afford the plants manure water alternately with clear water until the first flowers expand. This Campanula does equally as well planted out in the borders as it does in pots. Plant out in August, when the plants are well established in 32's; in March apply a top-dressing of cow manure.—G. R.

### Bad Effect of Grass on Apple Trees.

In the third report of the Woburn Experimental Farm,\* the compilers say: "As to the general effect produced by grass on young Apple trees, the results of the last few years have brought forward nothing which can in any way modify our previous conclusions as to the intensely deleterious nature of this effect, and we can only repeat, that no ordinary form of ill-treatment—including, even, the combination of bad planting, growth of weeds, and total neglect—is so harmful to the trees as growing grass round them. . . . The results of weighing some of these trees in 1898 showed that the grass-grown trees had not increased by more than about two-thirds of their original weight since they were planted in 1894, whilst their neighbours, which had been kept free from grass, had increased in weight from 10 to 13-fold. Judging by the appearance of the trees, we believe that a similar comparison at the present time would show a still greater difference. . . . Experiments have been devised to ascertain the cause of the action of grass on trees, and we may say at once that we have not yet succeeded in discovering this cause, although we believe that we have made considerable progress in the right direction, by reducing the possibilities of the case to within certain narrow limits. The evidence which we shall bring forward will, we believe, be sufficient to dispose of the views that the grass-effect is due to an interference with either the food supply, the water supply, or the air supply of the tree, and that it must, in all probability, be attributed to the action of some product, direct or indirect, of grass growth, which exercises an actively poisonous effect on the roots of the tree.

"The fact that numerous Apple orchards exist where the trees are flourishing in spite of being grass grown, forces us to conclude that grass is not seriously deleterious to Apple trees under all circumstances; and the one circumstance which naturally suggests itself as counteracting the evil effects of the grass, is the age of the trees. While discussing this subject in our second report (p. 173), we assumed, therefore, that the grassing-down of older trees might be effected without much injury, and, also, we suggested that certain of our results might be indicating that our trees, even then (1899), were beginning to recover from the effect of the grass (Second Report, p. 166).

"We have, however, now, no doubt but that such recovery as has occurred in our grass-grown trees, may be due simply to some of the roots having extended beyond the grassed area; whilst, on the other hand, experiments instituted to examine the effect of grassing-down trees of eight or nine years of age have proved that the action of the grass (at any rate, in our soil), is quite as deleterious to trees of this age as it is to younger ones, and we have received confirmation of our own experience from a practical fruit grower who has tried the experiment on still older trees. This will simplify the problem which we have to discuss at present, for, so far as our results have yet extended, the effect of grass on Apple trees is uniformly serious, independently of the age, variety, or root-stock of the tree.

"But, as recovery follows when the roots extend beyond the grassed area, it is probable that it will occur also, whenever the roots extend sufficiently far downwards to escape from the grass roots; and we must remember, therefore, that a tree may recover as it grows older, without implying that the effect of grass on its roots is different from the effect on the roots of younger trees: and this consideration will also lead us to conclude that trees might recover much faster in deep, rich soils, which favoured the extension of the roots downwards, than in shallow soils like ours, where a close subsoil of stiff clay tends to keep the roots very near the surface. Further, if recovery be brought about by the extension of the roots of the tree downwards, we should expect trees on the Crab stock to recover sooner than those on the Paradise."

### Value of Very Early or Late Fruits.

Considering how the price of ordinary fruit doubles or trebles at the beginning or end of its season, the value of an early or late variety may be easily understood. An example of the value of cross-breeding fruits is to be seen in Peach Duchess of Cornwall. It has been known to ripen nearly a fortnight before any other British hothouse Peach. It is a cross between an early Peach and an early Nectarine, and is earlier than either of its parents.

## Edible Fungi.

(Concluded from page 258.)

The following notes conclude our report of Dr. Cooke's lecture, delivered on September 15. The veteran scientist, in a letter on our "Readers' Views" page, names two useful publications for students.

*Agaricus villaticus* should rank as a species, but J. M. Berkeley only made it a variety of *A. campestris*. The cap is 9in in diameter, and has a skin like the common Mushroom.

Twice or thrice Dr. Cooke had received specimens, and each had come from coal-cellars: it is always associated with coal, which is significant. The Horse Mushroom is found in rings, in meadows; moreover, it is cultivated for ketchup. It is a well-marked form, and is widely distributed. The Bleeding Mushroom (see page 258) was first found in Hungary some years ago. The St. George's, or May Mushroom, so called because it makes its appearance about St. George's Day, has a distinctly strong odour. It grows in rings or parts of rings. The flavour bears some resemblance to that of the common *Agaricus*.

The Blue Caps (*Tricholoma nuda*) are found amongst decayed leaves in woods. They are three or four inches in diameter, and sometimes even five or six inches. They are of a bluish-purple colour, and make good eating, being best when cooked young.

The Dusky Caps (*Clitocybe nebularis*) attain considerable size, are of a cloudy-grey colour, with darker centres. They are found in December, and the flesh is thick and firm. This species is gregarious.

The Parasol Mushroom (*Lepiota procera*) has a cap of a dirty-white colour, borne on stems eight to twelve inches long, and only half an inch in thickness.

The Shaggy Caps (*Coprinus comatus*) is one of a very few black-spored *Agaricini* that are fit for food. It comes up freely in waste spaces, by roadsides, or amongst the rubble left around building sites. It is sometimes cultivated; and it should be cooked as soon as gathered.

Then the lecturer named the Chantarelle (*Cantharellus cibarius*), which is a brilliant golden-yellow fungus, one of the commonest, but, according to the Doctor, it has been praised far beyond its merits. However, "it may on occasion arrest the pangs of death." The top of the pileus is depressed, or crater-formed. These growths are to be found in woods in September and October, and for a surety in the New Forest and Epping Forest. It is considerably used in Paris.

The next little subject, the white-spored Fairy-ring Champignon (*Marasmius oreades*), has a great reputation, both at home and abroad. (In France, by-the-by, all *Agarics* are called Champignons.) Its stems are white and slender, the cap about one inch across, convex at first, but flat later; and it has creamy white gills. As a product, it can be dried and kept for winter use, as is invariably done on the Continent, and is employed in soups. By placing the dried caps in water, it soon assumes its original shape. Its habitats are widely placed, and it is common in Siberia and in Borneo.

Coming to the edible *Boletus*, Dr. Cooke said it possesses the external appearance of the typical *Agaricus*, but the minutiae of the gills and under surface differ. It is common in woods, and forms an article of commerce in Soho (London), and likely enough elsewhere. The flavour is like that of the common Mushroom. *B. scaber*, the rough-legged *Boletus*, has a quality much the same as that of *B. edulis*.

The Morellas, or Morels (*Ascomycetes*), are not so much esteemed in this country as in France, Paris particularly, though one sometimes sees them offered in Covent Garden Market; and can be purchased by the pound weight, for flavouring soups. In the British Islands there are five or six indigenous species. They are not "*Agarics*," but are closely related to that genus. Unfortunately, no methods have been found whereby they can be cultivated. In their natural state they are found from April to June on chalky or clayey soil, Smith's Morel attains one foot in height and seven inches in diameter. It is of a warm tawny colour.

The Helvellas are found in our woods, but much scattered in numbers. Where found, however, they can be gathered and hung up to dry. While the Morels all appear in spring, the Helvellas are autumnal. Dr. Cooke stated that in one afternoon's foray during this year his party collected no fewer than fifty species.

Lastly, the lecturer named the Great Puff Ball (*Lycoperdon bovista*), which, he said, was a phenomenon by itself. It is often as large or larger than a man's head. It has no gills, the spore-bearing mass being inside. The flesh is moist, juicy, and firm. It can be sliced a quarter of an inch thick, like a Turnip, fried in butter, and served hot, with spices. In olden days it was used as a dressing for wounds. It occasionally grows in gardens, singly, or two or three together. The full text of the lecture (doubtless with some illustrations) will be published in the Journal of the Royal Horticultural Society.

It has frequently been remarked that while certain kinds of Fungi appear every year in the same locality, others are ex-

\* Woburn Experimental Fruit Farm. Third report by the Duke of Bedford, K.G., and Spencer U. Pickering, F.R.S. 1903. Eyre and Spottiswood. Price 1s. 6d.

tremely capricious as to the time of their occurrence and the number of specimens produced. A single specimen, for instance, of *Paxillus paradoxus*, an Hungarian species, occurred last year, one in the west of England and the other in Kent, and in both instances was perfectly new to the British mycologist. The genus *Sprassis* was utterly unknown in this country till lately, but has now turned up in more than one locality. The White Truffle of Sowerby is a remarkable instance of the excessive scarcity of a particular species. From the time when it was figured by Sowerby a single specimen only occurred to Mr. Currey at Blackheath; Cooke found one also, and it has occurred in Herefordshire, and we have heard that it has lately been found under Oaks at Windsor—a species, it may be remarked, which has never been found by Messrs. Tulasne in their numerous researches, though it was not unknown to Vittadini. Corda appears to be the only one who has hitherto met with it in abundance, and excellent figures are given from his pencil in Krombholz grand volume. It was, therefore, with peculiar pleasure, during an excursion to the very interesting grounds of Rockingham Castle in Northamptonshire, that fine specimens of this rare plant were given to us by the excellent gardener Mr. Brown, who has found it more than once under Oak trees, not truly subterranean, but just peeping out of the ground, as is sometimes the case with the common Truffle, as in Somersetshire, where we have seen it cut in half in mowing the lawns.

The White Truffle appears to be very common in Bohemia, where it occurs in shady woods, and is much valued on account of its delicate flavour. It is too rare in this country to make it of much importance.—M. J. B. (in *Journal of Horticulture*, August 3, 1876.)

## Sir William Jackson Hooker.

There is a strikingly interesting biographical sketch in vol. xvi. of the "Annals of Botany" dealing with the life of a very eminent man of great individuality, whose history is one with that of the progress of botany in the most important period of last century, to whose force of character, indeed, we owe an entirely new development which gave to this country a pre-eminence which it still enjoys—very largely increased and augmented by the author himself.

The names of men who did good work can easily be recalled, but the modern developments of systematic and economic botany were to centre at Kew, and Sir William Hooker it was who laid the foundations and earlier courses of the present world-famed edifice. He founded the Herbarium, the Library, the Museums, and the Gardens, practically as they are to-day. The three chapters of this sketch cover three periods: Norwich and Halesworth, 1785-1820; Glasgow, 1820-1840; West Park and Kew, 1841-1865; and after them are extensive appendices, to be enumerated at the end of these abstracts. The following selection must be taken as omitting as much or more of equal interest.

### I. NORWICH AND HALESWORTH, 1785-1820.

"William Jackson Hooker was born in St. Saviour's parish, Norwich, on July 6, 1785. He was the younger of two sons, the only children of Joseph and Lydia Hooker, of that city. His father was a native of Exeter, the home of many generations of the Devonshire Hookers, where he had been a confidential clerk in the house of Baring Brothers, woolstaplers, with whose family his was distantly connected. From Exeter he went to Norwich, and into business there, where he had a collection of 'Succulents,' the cultivation of which class of plants was a favourite pursuit of many of his fellow-citizens. He was mainly a self-educated man, and a fair German scholar. My father's mother was a daughter of James Vincent, Esq., of Norwich, a worsted manufacturer, grandfather of George Vincent, one of the best of the Norwich School of artists, and whose works are now much sought for. Thus my father presumably derived his love of plants from his father's side, and his artistic powers from his mother's."

"When only four years old he inherited the reversion to a fair competency in landed and personal property in Kent, through the death of his cousin and godfather, William Jackson, Esq., of Canterbury, a young man of great promise. After leaving school he was sent to reside with a Mr. Paul, of Starston (a village on the borders of Suffolk), a gentleman farmer, who instructed sons of the landed gentry in the management of estates. Early in life he devoted himself to ornithology, visiting the Broads and sea-coasts of Norfolk, which abounded in rare birds, shooting, stuffing, and drawing them, besides learning their habits and songs.

"Sixty years later he knew the birds in Kew Gardens by the eye and the ear, and in a manner which surprised me. Though a keen ornithologist, and as keen an entomologist, he was almost

morbidly averse from taking life; he never shot for sport or for the pot; and many years afterwards, when instructing me in entomology, he was ever urging me to kill with the least suffering, and never to take more specimens than were necessary. His was one of those temperaments that later in life could not look on blood without a feeling of faintness, or on a wax model of the human face, with equanimity."

Sir William was born a student of natural history, and botany may not have been his first love. We read: "That his entomological pursuits were, when still in his teens, appreciated by the veteran Kirby is evidenced by the latter having, in 1805 dedicated to him and his brother a species of *Apion* with these words: 'I am indebted to an excellent naturalist, Mr. W. J. Hooker, of Norwich, who first discovered it, for this species. Many other nondescripts have been taken by him and his brother, Mr. J. Hooker, and I name this insect after them, as a memorial of my sense of their ability and exertions in the service of my favourite department of natural history.'

"I do not know the age at which my father took up botany. The first evidence of his having done so is the fact that he was the discoverer in Britain in 1805 of a very curious Moss, *Bux-*

The White Truffle.

*baumia aphylla*; but it may be inferred from this and from his correspondence with Mr. Turner (which I possess) that he had at the age of twenty-one thoroughly studied not only the flowering plants but the Mosses, Hepaticæ, Lichens, and freshwater Algæ of Norfolk. The *Buxbaumia* he took to his friend, Dr. (afterwards Sir James) Smith, of Norwich, the possessor of the Linnean herbarium, who advised him to send specimens to Mr. Dawson Turner, F.R.S., of Great Yarmouth, author of 'Musculogæ Hibernicæ Spicilegium,' and, with L. W. Dillwyn, F.L.S., of 'The Botanist's Guide through England and Wales.' This he did, and it was immediately followed by an invitation from Mr. Turner to visit him, which led to the colouring of his future life.

"In 1806, when only four months over his majority, my father was elected a Fellow of the Linnean Society, probably the youngest individual so honoured. In the same year he visited London, and was introduced to Sir Joseph Banks, König, Brown, and other naturalists. The years 1806-9 were passed between Norwich, Yarmouth, and London, with intervals of travelling in Scotland and Iceland. . . . In 1807, when botanising in the neighbourhood of Yarmouth, he was bitten by a viper. Fancying he had been pricked by a thorn he paid no heed to the pain, till giddiness came on, under which he succumbed. After lying for some time in a state of collapse he was accidentally found by some friends who carried him to Mr. Turner's, where violent fever supervened, followed by tedious illness. On recovery he started with Mr. and Mrs. Turner on a botanical tour in Scotland. . . .

(To be continued.)

### Lettuces at the Drill Hall.

Referring to your report of our exhibit of Lettuces at the Drill Hall on Tuesday, September 15, your paragraph stating that "These Lettuces were all sown on May 30, and dibbled into beds 5ft by 4ft," should have read: "These Lettuces were all sown on May 30, in beds 15ft by 2ft, drilled 12in between the rows."—DICKSON AND ROBINSON, Manchester.

### Hedges for Ornament, Shelter, and Profit.

Notwithstanding the fact of depredations even amongst fenced-in orchard crops, we still think fruit-tree hedges are possible in some parts. In its proper place we answer the following letter, which, however, for the subject it introduces, deserves the prominence we give it. Our querist writes:—"Now that we are hard driven to make the land pay, I shall be glad if you will tell me, in your 'Answers to Correspondents,' what hedge I can plant to pay me best. I want a quick-growing hedge for shelter, and the situation is an exposed one. I have thought of Cob Nuts, Fairleigh Damsons, and Cherries. Which of these do well in this part (St. Albans) of Herts? I do not see why our hedges should yield nothing.—E. R."

### Edible Fungi—Potato Disease.

Whilst thanking you for your courtesy in sending me a copy of the Journal for 17th inst., it is but justice to congratulate you on the report of the Fungus Show and Lecture at the R.H.S. meeting as one of the best, if not *the* best, of the many which have come under my notice; and I shall look out for the continuation. I may observe in reference to the last paragraph, that "British Edible Fungi," with twelve coloured plates of over forty species, is published by Kegan Paul, Trench and Co., and "Edible and Poisonous Mushrooms," with eighteen coloured plates of forty-eight species, by the Society for the Promotion of Christian Knowledge, at half-a-crown.

I have noted the remarks of "R. H. S.," page 264, on "Potato Disease," and shall take the first opportunity of publicly stating my opinion on the subject. My experience accords with that of the writer.—M. C. COOKE.

### Transplanting Large Trees.

I have had some experience in transplanting large trees, on one occasion planting about seventy Elms of from six to fourteen inches in diameter. About half of the number were frozen balls of roots. The remainder were dug after the frost left the ground with as long roots as possible, the roots being followed, and after digging being bagged and kept moist. The latter method is the better of the two, and is the one adopted by O. C. Simonds with the large Elms transplanted into Graceland cemetery, Chicago, of which Mr. Olmstead speaks. In the case I refer to, roots often twenty feet long were procured, and the trees planted in clumps on the surface of well prepared ground. The roots were carefully laid out, the trees guyed, and loam wheeled in to cover. Not one tree so treated was lost; on the contrary, all grew well. This work was done under the best possible conditions, the trees being selected in summer from open pasture lands, carefully dug, the roots kept moist, and carefully planted and mulched.

The trees dug with frozen balls did not compare nearly so favourably in results. About 10 per cent. died within three years, and a large percentage showed, in five years, their inability to recover from the murderous treatment of the roots at digging, the balls being dug from 6ft to 8ft in diameter.

Now while such good results may be had in transplanting Elms, Willows, or soft Maples, there are no other trees, in my experience, from which as good results might be expected. I have seen hundreds of thousands of dollars spent in the planting of large trees in Chicago, and, I think, nearly all wasted. The same amount of money spent in the proper preparation of the ground, with the planting of young nursery stock, would have been infinitely better.

There are times when the horticulturist has to do violence to his better judgment; and in such case, in the transplanting of large trees, I would recommend the getting of all roots possible; never mind the ball of earth if you can get roots and keep them

moist. Thin out a portion of the branches, but do it without seeming to have done it. Thoroughly prepare the bed for the tree; and, I ought to add, only attempt it with the trees I have previously enumerated, with the possible inclusion of red and hard Maples.

Conifers of 15ft or 20ft in height are no little things to transplant. As to what trees it is better to transplant in fall and which in spring, I have found it best to leave Oaks, Beeches, Magnolias, Tulips, Thorns, and Cornus florida for spring planting.—J. A. PETTIGREW, New England Park Superintendent.

### The Country Show.

The unfavourable season for bedding and flowering plants in general has naturally left its mark on the country flower shows. Moreover, the difficulties to be overcome only make exhibitors all the more eager to display their products. Some people urge the amalgamation of small country shows, but it is to be hoped that the day when the small country show will be a thing of the past is far distant. The local show is an event of the year, and it gives encouragement to small farmers and cottagers to grow the best.—S. D. N.

### Recipe for Elderberry Syrup or Wine.

In reply to "W. A.," page 265: Take any quantity of ripe berries; strip roughly from stalks, put into a stew-pan or enamelled saucepan; place by side of fire until all the juice is extracted; strain through muslin and put juice into clean pan; and to each pint add 1½lb preserving sugar, some bruised cloves, and root ginger, tied in muslin: these should be added according to taste. Boil about half an hour (or, if the quantity is large, until it thickens), stirring well. When done, bottle it. About two tablespoons to a tumbler of hot water, and a little grated nutmeg, makes a delicious drink.—(Mrs.) E. MARLOW, Greenwich Park.

### Recipe for Marrow Jam.

Seeing your invitation to readers to send receipt of Vegetable Marrow jam, I am sending my wife's. Nearly all the ladies ask for the receipt when they have tasted, and I can say it is very good: "1lb of sugar to each pound of Marrows; two lemons and ½lb of ginger to 5lb of Marrows. Cut the Marrow into squares an inch thick; put them into a pan and stew part of the sugar over them. The following day pour off the juice and add the ginger. Let it boil well, then add the Marrow, lemon juice and remaining sugar; boil until it sets, then take out the ginger and put the jam into jars. The Marrows ought to be ripe.—W. BYGRAVE, 22, Blatherwycke, Wansford, Northants.

In answer to query on Vegetable Marrow jam, I have made it for years in the following way, and it has always turned out well: Take the Marrows after they have been cut for a month; peel them, taking out all seeds; cut them up into 2in squares, and to every pound of Marrows put 6oz of best loaf sugar. Peel off half a lemon, and take its juice, add a good grating of nutmeg, also a piece of whole ginger. The lemon peel must be cut very fine, without any of the white on it. When the jam has boiled fast for one hour and a quarter, take it off, and take the ginger out. This jam must boil quickly, and be kept stirred all the time. P.S.—On no account put more than 6oz of sugar to the pound.—Mrs. PIKE, Melton Mowbray. [Is it not better to boil slowly?—Ed.]

I send you herewith a receipt for Vegetable Marrow jam which I have found most excellent. Take Vegetable Marrow which is too old for use as a vegetable, but not quite ripe. Cut it up in blocks about 1in cube; remove the seeds and the outer skin. Of this, place 7lb in preserving pan, and with it two lemons sliced right through, and very thin (with the pips removed), and over all put 7lb of best preserving sugar, and allow the whole to stand in a cool place for at least twenty-four hours. After this put in 2oz of crushed dried ginger in a muslin bag; and boil the whole slowly till it is quite clear, and the Marrow quite soft; it will take about four hours. The bag of ginger may be removed when the whole is nicely flavoured. No water need be added.—A. H. WILLIAMS.

In answer to "E. C. C. D." page 265: Peel and remove seeds from Marrow (which should be thoroughly ripe); cut into 1in pieces, and put into large vessel, and let stand for twelve hours. To each pound of Marrow add 1lb preserving sugar, and to every 5lb Marrow, the rind of three lemons, cut very thin, and about ½lb bruised ginger, tied in muslin. Boil until the Marrow is transparent; pot, and tie down while hot, which prevents the jam from crystallising. The lemon rind can be omitted if desired. I have always found this jam most delicious, and I should be pleased to forward a recipe for Marrow pickle if cared for. [By all means.—Ed.]—(Mrs.) E. MARLOW, Greenwich Park.

## Pointers for the National Dahlia Society.

The following letter has been laid before the Committee of the National Dahlia Society:—

During this my first year as secretary of the National Dahlia Society, I have been considerably impressed by the fact that whereas the number of applications for schedules from non-members since January has reached thirty-five, in only four cases have the applicants subsequently joined the society, and in looking through the list of applications received by Mr. J. F. Hudson in 1902 and the preceding years, I find the proportion to have been even less than this. The above fact suggests two reflections to my mind: firstly, that these persons are Dahlia growers, and are inclined to become members in order to exhibit at our shows; secondly, that having seen our schedule they do not consider the prizes sufficiently tempting.

There is without doubt a large field for recruiting amongst gentlemen's gardeners and amateurs of the industrial and trade class, who grow a limited number of plants; but these will not join unless the prize money offered is sufficient to cover the expense of getting to, and returning from, the show. I therefore wish to propose at the next meeting of the committee, that certain classes at present included in the schedule be abolished, and that the prize money, plus something in addition which, I think, we shall be warranted in offering, be transferred to other and more popular classes. To enable you to arrive at which classes can best be dispensed with, and which are the most deserving of additional prize money, I append a list of the entries for 1902 and 1903. The figures of previous years are not available, as the Crystal Palace Company kept the entries. [Here follow figures which we have omitted.—Ed.]

What I should like to propose is that Classes 5, 16, 17, and 21 be abolished, and that Class 19 be for "Twelve Show and Fancy Dahlias," instead of "Twelve Fancy Dahlias" as at present. This would release £10 2s. 6d. of prize money, to which I propose to add the sum of £5 2s. from the increased revenue of the society, making a total of £15 4s. 6d., which I suggest should be spread over classes in the Show and Fancy, and Cactus sections for amateurs [which are named in letter.—Ed.]

In recommending the deletion of three classes from the Show and Fancy section it must be pointed out that even then this section will have more than its share of the total prize money offered, as shown by the following figures:—

	Number of Classes.	Total Prize Money Offered.	Total Entries, average of, 1902-03.	Prize Money per class.	Prize Money per Entry
Show and Fancy ..	12	£ 28 10 0	40½	£ 2 7 6	14 1
Cactus, including Decorative classes..	16	£ 35 15 6	88½	£ 2 4 8	7 3
Pompon ..	5	£ 10 0 0	24	£ 2 0 0	8 4
Single ..	6	£ 10 0 0	17	£ 1 13 4	11 9

### NEW SCHEDULE AS PROPOSED.

Show and Fancy ..	9	£ 27 5 0	40½	£ 2 19 8	13 5
Cactus ..	16	£ 42 2 6	88½	£ 2 12 8	8 6
Pompon ..	5	£ 10 0 0	24	£ 2 0 0	8 4
Single ..	6	£ 10 0 0	17	£ 1 13 4	11 9

As I ventured to predict last year, when the new Class 21 was put in, this class has proved to be beyond the capacity of our amateurs, the one exhibit staged being of inferior quality, with the blooms tied together like an ordinary market bunch. I have suggested the addition of a fourth class for amateurs, "who have never won a prize," &c., and the raising of the prizes in this section to the level of similar classes in the general amateur section. My reason is that the entries prove this section to be the chief attraction to new members, and as our main object is to increase the membership, it seems doubtful policy to treat the new comers as inferiors by offering them prizes of considerably less value than we give for exactly similar exhibits in the old classes.

The net income of the society for this year promises to show a surplus balance of not less than £15, and probably of £20. Should the sale of advertisements in the new official catalogue realise the same sum as on the last occasion, namely £12 10s., the cost of the catalogue will be about met out of this year's income without reckoning on the proceeds of sale of copies to non-members, which on the last occasion came to £4 10s. Assuming, then, that we start next year with the official catalogue paid for, and with an evenly balanced account, as compared with a balance of £4 16s. 8d. at the end of last year, and that next year we make no progress, but obtain the same income as during the present year—our surplus at the end of 1904 would be about £15, so that I think we should be justified in taking £5 2s. out of this for additions to prizes. I much regret being unable to suggest better prizes in the open classes, but am sure that our professional supporters, who have been so generous to the society in the past, will cheerfully forego any addition to prizes in this section at present if they are of opinion that the above suggestions are in the true interest of the society.—P. W. TULLOCH, Sterndale, New Church Road, Hove, September, 1903.

## NOTES

## NOTICES

### Oxfordshire County Council Horticultural Students' Association

At a meeting of the above association held at St. John's College, Oxford, on Saturday, September 19, at 3 p.m., Mr. P. Elford, M.A., County Education Secretary, read a paper on "Nitrogen-forming Organisms," illustrated by lantern slides. This association is formed for the purpose of continuing the studies in horticulture and botany of those who have obtained the R.H.S. certificate through the County Council classes.—S. H., Hort. Instr.

### Orchid Sold for the R.H.S. Hall.

Possibly most of our readers noticed in last week's report of the R.H.S. meeting, that the *Zygopetalum* which received a first-class certificate, was to be sold, and the proceeds were to go to the building fund of the Society. We are informed that it (*Zygopetalum Rœblingianum*) was sold at Messrs. Protheroe and Morris's rooms for fifty guineas, Sir Frederick Wigan, Bart., being the purchaser, the auctioneers foregoing their commission. This *Zygopetalum* is a new hybrid raised by Mr. H. T. Clinka-berry in the gardens of C. G. Rœbling, Esq., of Trenton.

### The Testimonial to Mr. W. B. Latham.

At a general meeting of subscribers held at the Athletic Institute, John Bright Street, Birmingham, on September 14, after consideration it was decided that it was advisable to postpone the dinner from September 24 (as originally fixed) to October 22, in order that Mr. Latham's many friends at a distance may have an opportunity of showing their appreciation of his many kindnesses and life-long service to horticulture. We learn that Mr. Owen Thomas (late head gardener to His Majesty) and now of 25, Waldeck Road, West Ealing, W., has kindly promised to preside at the dinner and present the testimonial, and he will be glad to receive subscriptions, or they may be sent to the Secretary, Mr. J. Hughes, 140, High St., Harborne, Birmingham.

### County School of Gardening, Pymmes Park, Edmonton.

It is proposed to form a Gardeners' Mutual Improvement Society, and a meeting for this purpose will be held on Monday, September 28, in the Garden Library, Pymmes Park, Edmonton, at 8 p.m. The gardeners of Edmonton and the surrounding district are invited to attend this preliminary meeting with a view to arranging the details. The Middlesex Education Committee have kindly placed the garden library at the disposal of the proposed society; and the valuable collection of gardening and botanical books may also be utilised for the purpose of reference. Meetings will be held once a week, at which papers dealing with some branch of gardening will be read and discussed. Gardeners in the neighbourhood who are willing to join the society, or to read papers, are invited to communicate with Mr. J. Weathers, Pymmes Park, Edmonton.

### Fruit and Vegetable Show at Chiswick.

The Royal Horticultural Society will hold an Exhibition of British grown fruits and vegetables in their gardens at Chiswick on September 29, 30, and October 1. A Conference on Vegetables will be held on Tuesday, September 29, at 2.30 p.m., Mr. George Bunyard, V.M.H., in the chair. The following gentlemen have been asked to read papers:—1, "On Cooking Vegetables," Dr. Bonavia and Mr. James Hudson, V.M.H.; 2, "On Vegetables all the Year Round for a Private Family," Mr. W. H. Divers; 3, "On Vegetables for Exhibition," Mr. Edwin Beckett; 4, "On Vegetables for Market," Mr. W. Poupert. The exhibition will open at 12 noon, on September 29, and at 10 a.m. on the two following days, closing at 6 p.m. Fellows of the Society, on showing their tickets at the entrance, will be admitted free, and the public on payment of 2s. 6d. on the first day, and 1s. on the second and third day. At a general meeting of the Royal Horticultural Society, held on Tuesday, September 15, twenty-four new Fellows were elected, making a total of 1,141 elected since the beginning of the present year.

Our next issue will contain a full report of the gardeners' dinner and of the show.

**Appointment.**

Mr. G. Pike, as head gardener at Craven Lodge, Melton Mowbray.

**Potatoes above Ground.**

A singular freak of Nature has been grown by Mr. W. Meek, at Gayton, King's Lynn. Instead of bearing tubers at the roots, several Potato plants have grown the tubers on the stems above ground, like Gooseberries. On one plant alone between fifty and sixty tubers developed into a good size.

**Garden City Pioneer Company, Limited.**

The prospectus of the First Garden City, Limited, is, at present, only being issued to the shareholders of the Pioneer Company, members of the Garden City Association, and those who have shown some interest in the movement. On October 9 and 10 there will be a public inspection of the site, which is at Hitchin, thirty-four miles from London, and embraces 3,8000 acres.

**Purification of the River Seine.**

Someone has sent a marked copy of "Le Patriote," August 27, containing particulars of a scheme for purifying the Seine on its course through the Brabant communes, in the province of Anvers. It would seem that the river is somewhat malarial and dangerous to the public health. The purification system being attempted is the employment of "Pompes Élévatoires"—elevating pumps which, by means of a rotary wheel, carry up the water to suitable reservoirs, where the sewage (substances nocives en suspension) is held and the purified water escapes. The residue is subsequently conveyed away, and seems likely to be used as fertilising material for market-gardens around Paris and elsewhere.

**Croydon Gardeners' Society.**

Cryptogamic plants formed the subject of a lecture delivered before the members of this society at their rooms, Sunflower Temperance Hotel, on September 15. The lecturer was Mr. G. W. Shrubshall. The exhibits at the meeting also proved very attractive, and unanimous thanks were freely expressed to the exhibitors. Mr. A. Edwards, Ambleside Gardens, brought a good collection of Apples; Mr. E. Kromer, Brandon Hill Nurseries, bringing a flowering specimen of *Watsonia humilis*; Mr. J. Gregory, a flower of *Cereus triangularis*; Mr. A. C. Roffey, Croydon, Cucumbers, saved for seed purposes; and Mr. M. E. Mills, Coombe House Gardens, who brought varieties of Fern fronds and splendidly grown Dahlia blooms. The next paper will be by Mr. J. Cheal, Crawley, on October 6, when "Horticulture in America and Canada" will be his subject.

**The Gardeners' Dinner.**

Kindly permit me to make a final remark for the benefit of all attending our great reception dinner at the Holborn Restaurant on the 29th inst., that of the seating arrangement is in the hands of a small committee, of which Mr. Jaques, of Pound Street, Wendover, is chairman, and to whom all requests for small parties of three or four to sit together will be handed. The chairman's or long table will be reserved for distinguished visitors and speakers, with the exception of those who may prefer to sit with the vice-chairmen at the ends of the cross tables. A large plan of the tables will be hung in the reception room, and on which all engaged seats will be written so far as is possible. That is, of course, not a matter to be left to the last moment. Others making up their little parties in the reception hall (a large room) can thus arrange to sit together. Small parties are best arranged. There are large cloak rooms near the entrance to the restaurant. This, it is important to note, is in Newton Street, on the left-hand side from Holborn. Newton Street is exactly opposite the British Museum Station of the Tube railway.

Ticket-holders will have their dinner tickets collected at the tables. All are respectfully invited to hand in their name cards, filled up, at the door of the reception room. Ticket members have nothing to do with the seating arrangements. All speeches, it is urgently desired, should be short. The function is to be a social one. There is a long programme to get through. Any tickets yet unpaid should be settled for at once, any not sold should be returned. No one should leave getting a ticket till the last moment. They are going fast. Every effort will be made to render the function pleasant and enjoyable. Dinner will be kept waiting for no one.—A. DEAN.

**The Horticultural Directory.**

The editor begs to remind nurserymen, seedsmen, and more particularly head gardeners, that additions and corrections for the 1904 edition of the "Horticultural Directory" must be received at the office, 12, Mitre Court Chambers, Fleet Street, London, not later than October 5, to ensure insertion.

**The American Florists' Convention.**

The nineteenth annual meeting of the Society of American Florists has just been held at Milwaukee, and was in every way a pronounced success. The exhibition made a very fine appearance and compared favourably with the best ever held under the auspices of the society. At the meeting much good work was accomplished in every department, and the society is keeping well abreast of similar institutions in other lines of industry. The recent programme included papers on many important subjects.

**Prescot Dahlia Society.**

The third show in connection with the above society was held at Prescot on Saturday last, being most successful from every point of view. It is in no way connected with the Prescot Horticultural Society, who always hold their show too early to see the Dahlia at its best, but is managed entirely by a committee of workers, who spare no efforts to bring out the best possible results, the classes numbering thirty-four. The flowers of both Show and Cactus varieties had benefited greatly by the weather of the past few days, and many fine blooms were staged, Messrs. J. Lawton and R. Ball securing the awards for Show classes; and Mr. W. Rigby both classes for Cactus. The single specimen bloom classes were won by Messrs. Lawton, Rigby, and Cropper. Although the Dahlias formed a great attraction, there were other classes devoted to flowers in season and vegetables, Mr. W. Rigby scoring with Asters, Marigolds, and collection of cut flowers. Mr. W. Cropper had the best French and Runner Beans, and Mr. Peet Onions and Tomatoes. The Celery was magnificent, Messrs. J. Crawley and W. Cropper taking the lead. There were many special prizes offered, the contributors being Mr. and Mrs. Lyon and Messrs. Mee, Rogers, Seddon, Hatton, Baker, Ellis, Rainford, and Peet. Mr. J. Waine is a persevering secretary, and Messrs. J. Appleton and S. Waine are deserving of credit for their staging.—R. P. R.

**Reading Gardeners' Association.**

The last two gatherings of the members of this association were of a most enjoyable character, visits being paid to Danesfield, Marlow, by permission of Mr. R. H. Hudson, and to Hillside, Reading, by invitation of the President. The outing to the former place was by steamer, and the party numbered about sixty. Arriving at Medmenham, the visitors were met by Mr. J. Gibson, the head gardener, and conducted across the meadows to the Polo Ground, where lunch was partaken of. The president, Mr. Leonard Sutton, presided, and, on behalf of the members, tendered to Mr. Hudson their thanks for allowing them to visit Danesfield for the second time. After lunch, the party first inspected the kitchen garden, and, needless to say, great interest was manifested in the various crops of vegetables, specimens from which have made the name of Danesfield famous in horticultural circles throughout England and Scotland during the present year. A stroll through the grounds and a game of cricket made the remainder of the day pass pleasantly.

The visit to Hillside took place on the 14th inst., and was the first meeting of the present session. Previous to the meeting over 100 members sat down to a substantial tea, afterwards making an inspection of the garden. The subject for the evening's discussion was "Notes on a Recent Visit to the Gardens at Bear Wood," questions on the culture of crops seen to be answered by the head gardener, Mr. W. Barnes. This proved to be a very interesting evening. Those taking part in the debate were the president, Messrs. Powell, Fry, Exler, Judd, Burfit, Tunbridge, Challis, Hinton, D. Dore, E. J. Dore, Lever, and Alexander. The subjects touched upon were Strawberries, Begonias, Peas, Melons, Carnations, Vines, Peaches, Cauliflower, Potato, Sea Kale, Onions, Lily of the Valley, Beans, Celery, Solanums, Soils, &c. Before separating, a hearty vote of thanks was accorded to the president for his kind hospitality, and to Mr. Barnes for leading the meeting. Several new members were elected.

## The Royal Horticultural Society.

Scientific Committee, Sept. 15th.

Present: Mr. Michael (in the chair); Messrs. Odell, Chattenden, and Worsley, Professor Boulger, Revs. W. Wilks and Geo. Henslow, hon. sec.

*Silver leaf disease.*—With reference to the report in the minutes of the last meeting, Professor Gant wrote as follows: "I notice in this morning's 'Gardeners' Chronicle,' p. 196, a slight error. It is this, 'Silver leaf was due to a lack of nitrogen in the soil.' It should have been 'presence of too much.' I was quoting Dr. Massee. Mr. Bland, the owner of the fruit trees affected, before he wrote to me, sent some leaves to the Board of Agriculture, who sent them on to Dr. Massee. The following is a copy of the report: 'Copy A, 3350.—Diseased Plum trees.—The disease is generally known as silver leaf, and has been proved to be due to the presence of too much nitrogenous food in the soil. Abstain from using farmyard or organic manure of any kind, and sow rape or some quickly growing crop under the trees. Remove the crop when fully grown.'" Much hesitation was shown by the Committee in accepting this conclusion, as Portugal Laurels growing in poor, gravelly soil have been known to be badly affected, as much as garden fruit trees.

*Asparagus diseased.*—Herr Otto Froebel, Zurich V., sent the following communication, with specimens: "Dear Sir.—Permit me to send you to-day by post a monstrosity I observed since last year on my old plant of *Asparagus retrofractus*. We call such form 'Hexenbesen,' which means 'Witch's broom.' They are often observed on different hardy plants, on Conifers, trees, and shrubs. However, I have never observed this anomaly on any one of my various species of *Asparagus*, and I hope it will be interesting to the readers of the Journal of the R.H.S. if you will bring this notice." Mr. Michael undertook to examine the specimen. "I intend to send you next spring a flowering branch of the quite new *Forsythia europæa*, Deegen and Baldacci, introduced by seeds in 1899 from Albania. I should feel much satisfied if I could send first flowering branches of this new shrub, very hardy in my country, and if this novelty could be figured in your very fine and always most interesting Journal."

*Chimonanthus, abnormal foliage.*—Mr. Odell showed branches bearing normal as well as bifurcated leaves, arising from a separation of the fibro-vascular bundles of the midrib, at various distances from the base. In some it commenced even in the short petiole.

*Eelworm in Agrostis.*—Mr. Chattenden showed examples of the unusual position of eelworms in the inflorescence of this grass.

*Ceoma in Campanula.*—He also showed examples of this fungus in *C. rapunculoides*, as well as an apparently new species of fungus attacking the sepals of *Clematis*.

*Dracæna with aerial root.*—He also exhibited a stem which had been ringed producing a downward growing "toe," or adventitious root, upwards of a foot above the ground.

*Heuchera, floriferous.*—Mr. Wilks received a plant in foliage, on every leaf of which a foliaceous bud was developed at the base of the blade on the upper end of the petiole. There appeared to be no account of such being a normal condition.

*Figs, drying and falling.*—Mr. Worsley drew attention to the fact that certain Figs frequently ceased to mature after a certain time, then dried up and fell off. The general opinion was that nourishment was diverted by some cause or another, as the winter Figs always fall off as soon as foliage appears in this country.

### Narcissus incomparabilis Gloria Mundi.

By the kindness of Messrs. Barr and Sons we are able to give an illustration on this page of a flower, almost natural size, of this gem of Daffodils. We would class this as one of the best half dozen, choosing from the whole tribe of *Narcissi*. *Barri conspicuus*, *stella superba*, and *Gloria Mundi* are an unsurpassed trio. The corona is glowing orange-red, and the perianth is a sweet soft yellow.

## Hardy Flowers at Edinburgh Show.

As a supplement to the excellent report given by your representative at the Royal Caledonian Society's Show on September 9 and 10 a few special notes on the hardy flowers exhibited may be serviceable to the many growers of hardy flowers in the kingdom. It may be said, by way of preface, that the hardy herbaceous flowers were, as a whole, very good, but that there was a very small representation of new or rare plants, apart, of course, from the numerous varieties of florists' flowers, which can hardly be dealt with now, so numerous are the newer *Phloxes*, *Pentstemons*, *Gladioli*, and *Carnations* on exhibition. These were, as a whole, admirable, and the *Pentstemons* were exceedingly fine, presenting a great contrast to the small, narrow flowers which often found a place in prize stands of our early days.

*Gladioli* were superb, but the most of these are purely florists' flowers, and cannot receive notice, save, perhaps, the fine colour of the purple-blue flowers of the *Lemoinei* variety *Baron J. Hulot*.

Narcissus incomparabilis Gloria Mundi.

Barr and Sons

in Messrs. Cocker's large exhibit, which had no competitors in its class. This has been "out" for a few years, but is seldom seen so fine. One must, however, also remark upon a splendid scarlet *Pentstemon* named Preston Hall, and raised in the garden there. It seems to partake much of the character of the now scarce but hardy Newberry Gem, but is much larger and more perfect in form. This should be a really good plant, and it is one, by the way, of which Mr. J. W. McHattie thinks highly, from having used it in Edinburgh public gardens.

As has already been remarked, new flowers were few, but one observed two lots of the double variety of *Gypsophila paniculata*, already familiar to frequenters of the Drill Hall exhibitions of the Royal Horticultural Society. This is, I believe, the first time it has been shown in Edinburgh. There were also two lots of the pinkish coloured *Astilbe sinensis*, but these were not very well coloured, and did not do justice to the plant. I do not think this has been shown in Edinburgh before. *Chrysanthemum maximum* King Edward is referred to below. Among the most noticeable of the other things one must place the magnificent spikes of *Eucomis punctata*, shown by Mr. Adam Brydon, of Innerleithen, in his first prize stand. I imagine that finer ones have never been shown. Though they came from under glass they may be regarded as examples of what may be done with this Orchid-like bulbous plant when cultivated as it might be. The secret appears to lie mainly in keeping the soil dry until the plants start, and then giving them frequent supplies of liquid manure. The same plant was shown elsewhere, but not nearly so well as the spikes shown by Mr. Brydon, who deserves every credit for his success.

Considering the season we have had, the *Kniphofias* shown by Messrs. Cunningham Fraser and Co., of Comely Bank, were very fine, the noble *Obélisque* and the lovely *Lemon Queen*, being among the best, though the older *corallina* deserves also a note to itself. *Eryngiums* were less seen than one expected, but I observed one or two good heads of *E. Zabeli*; while *E. Oliverianum* was also in several stands. *Echinops* were plentiful, and in some competitive stands they were rather unduly numerous in proportion. *Physostegia virginica* (*Dracocephalum virginianum*) was well done in some of the stands; and I observed some good pieces of *Chelone Lyoni* and *C. obliqua*. *Phygelius capensis* was seen several times, but not so well coloured as in my own locality, in the south-west of Scotland. Messrs. Laing and Mather, who seem to be making a new departure into alpinism, had a nice plant or two of *Asteriscus maritimus*, a neat yellow plant one does not often come across, among some other alpinism of more or less rarity.

Among the plants one expected to see more largely shown were the *Rudbeckias* and *Echinaceas*, of which few bunches were in evidence in the different stands; indeed, although represented, of course, such autumn composites as *Helianthus*, *Inulas*, and *Heleniums*, were not nearly so plentiful as might have been looked for. *Galtonia candicans* and *Liliums* were well shown, but the latter comprised nothing at all uncommon. There were only a few perennial *Asters*, it being early in the season for these, but there were some bunches of varieties of *Aster aeris* and some of the *A. Amellus* forms, a good one, *Distinction*, being the best, perhaps, of those seen. The allied *Erigerons* were represented by *speciosum*, *glabellus*, *Coulteri*, &c. *Gaillardias* were pretty numerous, and *Lobelia cardinalis* was in several stands. There were several *Delphiniums*, but the most noteworthy were a pale blue double one, perfectly imbricated, named *Gloire de Nancy*, and a good bunch of the curiously coloured purplish blue *D. Brunonianum*, a plant which looks much better when cut and in a bunch than when in the garden. There were a few *Polygonums*, the best being a good bunch or two of *P. affine* or *Brunonis*. *Veronias* were frequently shown, often in capital form, and it is evident that *V. longifolia sub-sessilis* still holds its own in the favour of exhibitors, though here and there one came across *V. l. rosea*, and there were one or two lots of *V. virginica*.

*Chrysanthemums* were largely utilised, but only such as *C. maximum* and its forms may be remarked upon now. Undoubtedly the finest thing of the kind there was *C. m. King Edward*, as shown by the raiser, Mr. W. Angus, Penicuik, and a truly noble flower of its class. *Campanulas*, as was to be expected at this time of the year, were not so fine as earlier in the season, but some good spikes of *C. persicifolia alba grandiflora*, and one or two others, were exhibited. Then there were several striking exhibits of *Alstroemerias*, and one observed some good lots of *Gentiana asclepiadea* and *G. a. alba*, with several lots of *Bocconia cordata*, though I failed to recognise any of the newer *Bocconias* sent out lately. *Galega officinalis* occurred here and there.

There were a great many bunches of *Montbretias* of the usual varieties, but by far the best was the fine *Germania*, which does not gain ground as it ought to do. One was disappointed to find so little variety among the bunches of *Anemone japonica*, the variety *alba* being best represented. Some of the newer French or German varieties might with advantage be included in some stands. *Violas* are not referred to in detail, the number and variety being practically endless.

These notes are not intended to be exhaustive, but to give some idea of the general character of the flowers shown, as they appear to one who makes a special study of hardy flowers. —S. ARNOTT.

## Small Copper Butterfly.

The "merry little Copper" Butterfly dashes to and fro in gardens and open fields in summer, lending to the scene that aspect of joyousness and brightness which the flapping wings of these frail fair creatures always give. It, of course, has been mentioned by "Entomologist" in his notes on "Insects for Garden Adornment" recently concluded in the *Journal*, and if it does no especial good, it does no especial harm. We may see it

Small Copper Butterfly.

all through October and even into November; for the autumn individuals of this species do not survive the winter, but flutter on until their lives are ended by the cold nights. The Copper is inclined to be pugnacious, and these butterflies may be observed chasing autumn specimens of the common Blue, or even the Tortoiseshell.

The caterpillar of the Copper Butterfly is found in August feeding upon Docks and other species of *Rumex*. The "Coppers" appearing in October prove to be the parents of a brood which hibernate. They possibly pass the ungenial months low down, resting on the stems of grasses or upon the earth.

## Obituary.

Mr. James Smith, V.M.H.

The death of this notable gardener in the sixty-sixth year of his age, in Scotland, will be learned with surprise and regret by the horticultural fraternity in general. He was such an amiable, straightforward, manly man, that everybody respected and trusted him. We always found Mr. Smith quiet; at least not inclined to be impulsive, but meditative always, weighing well his utterances. He died at midnight on Friday last.

For twenty-nine years he has been head gardener at Mentmore, first to the late Baron M. Rothschild, and then to Lord Rosebery, having during his long tenure made considerable alterations which were somewhat fully recorded in the *Journal of Horticulture* in our Spring Number for 1900. A photograph of his own house (but not of himself) was given at that time. We have been unable to secure a portrait of Mr. Smith. In appearance he was tall and rather spare, with white beard and hair, keen grey eyes, and even features.

As a gardener his practice has gained great repute. He was a member of the Fruit and Vegetable Committee of the Royal Horticultural Society, much in request as a judge, and a writer of note in our own and other gardening papers. Mr. Smith was one of the original Victoria Medallists of Honour in horticulture. His special lines were fruit, Orchids, and *Chrysanthemums*, and he was keenly interested in hybridisation.

Mr. Smith left Messrs. Veitch's, Chelsea Nursery, in 1869 to go as gardener to Lord Gainsborough, and left a year or two afterwards for Mentmore.

## Lack of "Push" in the U.S.A.

The editorial comment below, from "San Francisco Argonaut," shows the surprising backwardness of the American Government in a matter of the most vital importance: "The need of a parcel-post system is more keenly appreciated in Europe than it is in this country. After vainly urging the Government authorities at Washington for joint action, the British Postal Department has established an independent service. Under this system parcels weighing 11lb are carried for seventy-two cents from any part of Great Britain to any part of the United States. In bulk a maximum in girth and length of 6ft is allowed. Since the Government of this country has refused to co-operate, the British Postal Department has made arrangements with the Adams Express Company to carry the parcels in the United States. An agreement has been entered into with Germany by which the Postal Department of this country carries parcels of 11lb coming from there, and sends parcels of the same weight to Germany, but it is said that a movement is on foot to reduce the maximum weight to the limit recognised in domestic mail of 4lb. The Belgian Government is said to favour the establishment of such a service with this country, and the Anglo-American Chamber of Commerce at Brussels has asked the Chamber of Commerce in this city to favour the movement. The parcels post has become a commercial necessity, and it is time that this Government adopt it."

### Fruit Forcing.

**MELONS: IN HOUSES.**—The days are now shortening, the nights being relatively cold, even white frost occurring in the morning, and the moisture increases, therefore it is necessary to exercise care and judgment in watering, never doing it unnecessarily. The latest plants, however, with the fruit swelling must not be allowed to become so dry at the roots as to prejudice the foliage. Maintain moderate moisture by damping the floors, walls, and sides of bed every morning and at closing time, earthing up the roots as required, but late plants require less soil to grow on than the midseason plants. Remove all superfluous growths as they appear, and maintain a temperature of 65deg to 70deg at night, 5deg less on cold nights, 70deg to 75deg by day, up to 85deg or 90deg with sun. Keep the bottom heat at about 80deg. Fruit ripening will be better for a little extra fire heat and a circulation of air constantly. A dry condition at the roots, but not so as to cause the foliage to flag, accelerates the ripening process and enhances the quality of the fruit.

**IN PITS AND FRAMES.**—In those heated solely by fermenting materials no water will be required after this time unless the soil is dry and the foliage becomes limp, which it must not be allowed to do. Any water supplied should be so as not to wet the foliage or even the surface of the bed more than can be helped. Keep the frames well lined, admitting a little air constantly, which, with the fruit raised well above the surface of the bed, will do much to accelerate the ripening, prevent decay, and impart flavour. Any fruit it is wished to keep for a time should be cut when it is changing colour with a good portion of stem, and be kept in a dry, airy room, or if wanted ripe at once it may be placed in a warm, airy house on a shelf in the full sun. Melons ripen better there than in frames or pits devoid of fire heat.

**VINES: EARLY FORCED IN POTS.**—This is the most advisable method of securing a supply of thin-skinned, fresh, ripe Grapes early in spring, which are a necessity in some establishments. The best varieties we have tried are White Frontignan, Foster's Seedling, Black Hamburgh, and Madresfield Court. The great evil in early forcing Vines in pots or anywhere is overcropping, the berries not attaining the size and perfection of colour and finish so essential to their high appreciation. Where bottom heat can be given to start them they will show their estimation of it, and the soft glow of moisture given off by the fermenting material in breaking freely. It is desirable to stand the pots on brick pedestals, placing the bricks loose and so high that the rims are slightly raised above the pot edge, the arrangement being such that the pots will be in the centre of the bed, which should be 3½ft or 4ft wide, and as much in depth. Leaves (Oak, Beech, or Spanish Chestnut) being placed in to fill the pot, a gentle warmth will be afforded the Vines, and the roots will pass from the pots into the leaves, deriving support for the swelling and perfecting of the Grapes.

To have Grapes ripe at the end of March or early in April the Vines should be started not later than the early part of November, and they ought to be placed in position by the middle of October, so that they may have about a fortnight of preparation in the way of admitting air freely above 50deg, this being secured by artificial means, and then the sap will become quickened, ready for starting the Vines away strongly when forcing proper commences. The canes must be depressed to a horizontal position, or lower, to secure them breaking regularly. Damp the canes morning and afternoon, but do not keep them constantly dripping with water. In an atmosphere kept at a temperature of 50deg to 55deg the buds will soon begin to swell, then gradually raise it day and night to 60deg to 65deg when they are breaking, allowing an advance of 10deg to 15deg from sun heat. The temperature at the base of the pots ought not to exceed 75deg, and it is better to commence with it at 65deg about the pots, and increase the warmth as the growth advances. Water must be given carefully at first, that the soil be kept evenly moist, not in any case wet, as this retards rather than forwards root formation, and it is only when the Vines have leaves and evaporate largely that plentiful supplies of water are required.

**MIDSEASON HOUSES.**—Black Hamburgh and other descriptions of thin-skinned black Grapes have the colour taken out of them by hanging, and it can only be lessened by good spread of foliage, or drawing a double thickness of herring net over the roof lights. The latter is the preferable plan, as lateral growths interfere with light to the principal leaves, and the free access of light and air so desirable for maturing the wood. The Vines from which the Grapes have been cut may have the growths

cut back to a few joints above the pruning buds, first curtailing the laterals, and then cutting back the main growths, this insures the buds becoming plumper, whilst the freer access of light and air affects the wood favourably. A free circulation of air is necessary to expel damp, with a little, constantly, to prevent the deposition of moisture on the berries. Maintain warmth in the hot-water pipes when the external air is cold and damp, but the wood being ripe, and the growth matured, it will suffice to maintain a temperature of 50deg, and the cooler by day the house is kept, the longer the Grapes will keep plump. Vines that have not the wood ripe should not have a less temperature than 60deg, and this, with a free circulation of air, must be continued until there is no doubt on the point. Keep the laterals well in check, not allowing them to interfere with the chief growths. The border must not be allowed to become too dry, or the Grapes will shrivel, therefore afford a supply of water where necessary, always in the morning and on a fine day, so that air can be given and the superfluous moisture pass off. The watering will not do the least harm, for it is not moisture at the roots, unless excessive, that causes Grapes to spot and decay, but a confined, stagnant atmosphere. It is condensed moisture (may be imperceptible) on the berries that gives moulds their opportunity, which they never let pass by, but grow and multiply under the favouring circumstances. Keep well ventilated, and have no leaks in the roof, then all will be well with the Grapes.—ST. ALBANS.

### Kitchen Garden.

**LETTUCES.**—If a good supply of seedling plants are at hand, dwarf and stocky in growth through being grown thinly, the result of sowing sparingly or thinning out early, these may safely be transplanted to permanent positions. The best places for growing winter Lettuce are undoubtedly south borders which lie dry and sheltered. The soil may be rich and capable of sustaining a steady growth, but where any excess of moisture naturally drains away. Lift, if possible, the plants with small balls attached, and plant them 6in apart in rows a foot asunder. This permits of the necessary cultural operations, weeding and hoeing, being carried out with ease. Where natural shelter for the plants cannot be commanded it will probably be possible to extemporise a temporary shelter, for a portion at least, with moveable lights. Too close confinement will cause damping. Some may be planted in frames, but the fullest exposure should be given until it is really necessary to protect. In addition to planting a good supply of strong seedlings, some plants of larger growth and commencing to heart may be lifted with a liberal quantity of roots and soil, and be established in frames, the lights of which ought not to be placed over them except during severe frosts or heavy rains. These will come in useful for early winter use. Plants standing in seed beds may with great advantage be thinned, as if crowded they will certainly succumb to damp and frost.

**CAULIFLOWERS.**—The autumn Cauliflowers are turning in now, and need protection. This may be afforded to the heads by laying over them a leaf, which prevents discolouration. Caterpillars may be troublesome, and if so ought to be searched for and destroyed. Seedlings from a sowing made last month will be of sufficient size to prick out, either on a sheltered border or in a frame. The latter offers the advantage of giving slight protection from frost and damp in winter.

**TURNIPS.**—Thinning out must be continued until the plants stand at a sufficiently wide distance apart for developing roots satisfactorily. Those which have advanced to a useable size must be kept free of weeds and useless leaves. Later some of the roots may be taken up and stored for use in winter when roots in the open ground cannot be obtained. To encourage the growth of young seedlings dust lightly with soot and hoe in. Hoe also to keep down weeds, and to break the caked surface of the soil when it has dried after rain.

**POTATOES.**—Diseased crops are, unfortunately, prevalent this season, and the bulk of varieties should be lifted as soon as possible, carefully examining them and picking out all those affected, which it is best to burn. All tubers apparently clean should be placed under cover to dry thoroughly, laying them at present thinly, and excluding light, except from those intended for seed. In a few weeks another examination may be made, after which store the sound tubers in a frost-proof place, but cool and thoroughly dry. After lifting a crop, collect and destroy the haulms by burning.

**ONIONS.**—The sowing of Onions made last month should need little if any thinning, but the removal of weeds from among the seedlings ought to be effected early before they become strongly rooted.

**SPINACH.**—Thinning out and weeding is necessary with the crop of winter Spinach. The final thinning should be made to the extent of leaving the plants 8in apart. Frequent hoeing between the rows is of advantage in promoting a healthy growth.

**TOMATOES.**—Outdoor plants may be encouraged to ripen their fruit more quickly if lights can be set up before them. Fruits commencing to colour will quickly ripen if gathered and placed on a shelf in a warm house.—EAST KENT.

# THE BEE-KEEPER.

## Weak Colonies.

During the present month any weak stocks which it is thought will not be able to pass through the winter safely should be united. What few bees there are in such colonies will be comparatively old and very many of them worn out, so that it would be next to useless to stimulate them in the expectation of their building up sufficiently strong to winter successfully, or even to seal up food for their use. In order to obtain the utmost power from them the next season it is necessary to unite such stocks to other medium colonies, making fairly powerful lots of not less than seven bars well covered.

Uniting, when the bees are on bar frames, is accomplished by lifting out, after first smoking and subduing them, with the combs of bees on the stand which they are to finally occupy, and feeding commenced at once, so that their stores may be placed in their natural position. It must be understood that only those stocks which are on bars, and which are near to one another, can be united in this manner. Those colonies which are distant from one another in the same apiary must first be brought together gradually by short stages on such days as they can fly, and then united, placing the hive midway between the positions which the two separate stocks occupied, with a large alighting board at the front. This prevents fighting, and causes the bees to mark the location.

It is better to unite the weaker stocks with their stronger neighbours in preference to joining the stronger to the weaker. There is less probability of robbing. The old queen preferably should be removed a day or two prior to uniting. The next fine day when the bees are not flying, and yet not cold enough to chill them, say 50deg to 55deg, there will be no trouble. To induce the bees to fill themselves with honey go to the hive to be operated upon, and blow a good volume of smoke in at the entrance, at the same time jarring the hive to frighten the bees, as upon this depends the success of uniting. Take the combs of bees from the hive and alternate them with the frames in the other colony. The efficacy of uniting depends entirely upon letting daylight in between the bars, and both colonies being thoroughly gorged with honey, and this is only the case when the subdued hum is heard. Until they roar, smoke should be supplied at intervals.

Hungry bees, or bees on frames, and loose bees never unite peaceably, so that when there is not plenty of unsealed honey to gorge themselves with they should, despite the labour involved, be sprinkled liberally with syrup before attempting a union. If afterwards there are any signs of fighting use the smoker freely, and thump the hive sides. Stocks which do not cover the whole of the frames should be dummied up, and the unnecessary combs removed. The latter should be wrapped up in newspaper and afterwards stored away in a dry place where mice will be unable to get at them.—E. E., Sandbach.

Misty mornings and fine days.

# TO CORRESPONDENTS

\* \* All correspondence relating to editorial matters should be directed to "THE EDITOR," 12, MITRE COURT CHAMBERS, FLEET STREET, LONDON, E.C. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense. In naming plants we only undertake to name species, or well-marked varieties, and only six on any one occasion. Florists' flowers we do not name.

## PLACING ROSES IN POTS OUT OF DOORS (R. T. L.).—

It is not necessary at this season to place Roses outdoors that have been grown in an airy greenhouse for the ripening of the wood, as that will, if the plants have had plenty of light, be thoroughly perfected, and the only good that exposure would effect would be in inducing rest, assigning them a sunny position, and housing before the weather becomes severe, the pots being plunged in ashes to the rims. The Cactuses should between now and the end of the present month be placed indoors, or before the soil becomes soddened with wet or the plants injured by frost.

## HIVE OF BEES WITHOUT BROOD: IS IT QUEENLESS? (S. P.).—

"E. E., Sandbach," writes: "It is nothing unusual for a colony to be broodless at this time of the year, owing to the season finishing early, and artificial stimulation not being followed up. Before deciding that the stock is queenless your correspondent may test it by putting a bar of hatching eggs in the centre of the brood nest, and if queen cells are commenced upon it then it is without a queen. They would be in the same condition if they had superseded the old queen and reared a virgin, but the probability is that it is simply cessation of breeding, which is quite natural. If a half pint of warm syrup is administered nightly for a week there will no doubt be eggs laid."

**ROSE LEAVES BLACKENED AND COATED WITH A WHITE SUBSTANCE (W. R.).**—The leaves are affected by the Rose-leaf black blotch (*Actinonema Rosæ*), which is very common on Rose leaves, and seen in almost every garden this season, and many cultivators treat it as of small account, except for disfiguring the foliage. The spots often run into each other, and cover a large portion of the leaves, chiefly from the point. The spots are at first purplish, half an inch to an inch broad, and then black. When black they become closely adherent with flexuous web-like lines, and have a whitish appearance on the upper side, to which the affection is confined. Here and there are small black conceptacles or perithecia, which contain the spores, but these are not always present. It has been advised to remove all the leaves, but if this were done the bushes would, in many cases, be entirely defoliated. Spraying with blue water, Eau Celeste, or ammoniacal carbonate of copper solution, is a preparation much in vogue with some cultivators, and is found of much service.

## PROTECTION AGAINST SLUGS AND SNAILS (F. T.).—

The question is often asked, and we extract from a recent number of the "Gardeners' Chronicle," an interesting account of experiments that have been made to ascertain the means by which some plants are protected from the attacks of slugs and snails. Tannin appears to be one of the substances objectionable to them. Experiments made by Stahl showed that Carrot, which, from its sweetness and absence of tannin, is particularly attractive to slugs, if treated with a one per cent. solution of tannin remained practically untouched by the common small garden slug, *Limax agrestis*, and if a solution of 1 in 1,000 of water be sprinkled on the animal, it rapidly disappeared from the scene of operation. Similarly, it was found that the leaves of *Valisneria*, *Trapa*, and other water plants containing tannin were avoided by the water snails, *paludina*, *limnaea* and *planorbis*, but if the tannin were extracted the leaves were speedily eaten. Acid sap has a similar effect. *Rumex acetosella*, *Oxalis* and *Begonia* are disliked on account of the potassium binoxalate they contain. This was proved by soaking pieces of Carrot in one per cent. solution of the salt, and putting them before the slugs *Arion hortensis* and *Limax agrestis*, and the snail *Helix hortensis*, the pieces being untouched after a lapse of several days. A solution of the salt of 1 part in 1,000 of water was found to irritate the animals, and cause them to remove to other quarters. Plants with hairs secreting acids are similarly avoided, as in *Cicer arietinum*, *Oenothera*, &c. Ethereal oils are similarly protective; leaves of *Rue*, *Acorus calamus*, and *Mentha piperita* are carefully avoided by snails, but if the oil is extracted they are readily eaten. Bitter

substances are also protective. Young leaves of *Gentiana lutea* and *Menyanthes trifoliata* are scarcely touched, though extracted leaves are at once devoured. In autumn the bitter substances appear to be no longer efficacious.

**RASPBERRIES FRUITING ON CURRENT YEAR'S CANES (W. A., Shrewsbury).**—We assume that you refer to the summer-bearing varieties, such as Red Antwerp, Baumforth's Seedling, Fastolf, Superlative, &c., which generally produce the fruit on growths from the canes formed in the previous season. In such case it is somewhat unusual for these summer-bearing varieties to bear fruit on the current year's growth, though it sometimes occurs on a lateral here and there, and even terminally, especially when the canes are very vigorous, and the season uncommonly wet. We have also noticed that when the growths from the previous year's canes are damaged by spring frosts, the current year's growths are subject to bear fruit late in the summer. Of course, it is not uncommon for last year's canes to bear fruit on the current growths when cut over close to the ground, even in the case of the summer-bearing varieties, and this practice obtains with the autumn-bearing kinds which are cut over at the ground annually, and thus produce fruit on the current year's growth in late summer and early autumn.

**HEDGE FOR SHELTER AND PROFIT (E. R.).**—There is a great difference between a hedge for protection and the term as applied to a shelter. In the case of a hedge that must form a barrier against men and animals the trimming necessary to form and maintain a close growth is fatal to the production of fruit, though we have seen fairly good crops of Damsons on bushes planted so closely as to form a hedge in three or four years, only the straggling growths being shortened from time to time so as to prevent too much encroachment, and maintain a relatively compact growth. The best subject for the purpose is the Kentish Cluster, Farleigh, or Crittenden Damson, a mere wildling, but no fruit tree has been more extensively planted as shelter-screens to fruit plantations, and the profusion of fruit it bears, even in exposed situations, can scarcely be credited. Indeed, it is a good tree as a protection from gales on the outsides of fruit plantations or gardens, especially when the ground on both sides of the hedge is in one person's holding, they may be advantageously planted in the hedges, and a quantity of fruit taken where larger trees would be an objection, sides of roads and near foot-paths being avoided. Where a fence, not to be kept very trim, is desired, bushes should be planted, say a yard apart, and after the hedge is as high as desired every fourth or fifth tree may be allowed to grow up and form a head, which, well pruned in for a few years, soon become symmetrical, are beautiful in flower, and more so when laden with their rich violet fruit. Cob Nuts are not suitable for exposed situations, do not form a good barrier, and do not bear well unless the growths are relatively thin. Cherries, unless Kentish, do not succeed as screens. Semi-wild, only irregular growths being pruned in, that variety bears enormously, also Morello, especially when trained to a wire trellis of 5ft or 6ft height. We advise the Damson for your position.

**NAMES OF PLANTS.**—*Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number.* (F. W.).—The Roses were subjected to an expert, who declined to give them names, saying they were altogether out of character at this late season. Your better plan would be to send good specimens next summer to a leading Rose-grower. (F. T.).—The Ivies are: 1, *amurensis*; 2, *dentatus*; 3, *atro-purpurea*; 4, *aurea spectabilis*; 5, *donerailiensis minor*; and 6, *Emerald Green*. (J. Thom.).—1, *Clematis græca*; 2, *C. graveolens*; 3, *Corylus Avellana aurea*; 4, *Berberis nepalensis*; 5, *Quercus coccinea*. (A. C.).—1, *Tasconia digitata*; 2, *Weigela Eva Rathke*; 3, *Acer colchicum rubrum*. (Bury).—1 *Fuchsia virgata*.

**NAMES OF FRUITS.**—*Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number.* (G. F. B.).—1, *Frogmore Prolific*; 2, *Sandringham*; 3, *Cox's Pomona*; 4, *Newton Wonder*; 5, *King of the Pippins*. (C. N. R.).—1, *Worcester Pearmain*; 2, *Lord Burghley*.

**PUBLICATIONS RECEIVED.**—"The Animals' Friend," containing "The Sparrow and the Government," &c. \* \* "Tropical Agriculturist," August, 1903, containing notices of the latest book on Tea, Vines in Hungary, Coconut Palms and their Enemies, a new Fruit Jelly (roselle), Pineapple culture, Soil Nitrification and Mosquitoes. \* \* "The Indian Agriculturist," September 1. \* \* "Le Moniteur d'Horticulture," containing a coloured plate of *Heucheras*. \* \* "The Orchid Review," September, 1903. \* \* "Practical Advice on the Best Vegetables to Grow for Home Consumption and Exhibition." Albert Upstone, price 3d. \* \* "Pall Mall Gazette," containing illustrated article on the new premises and offices of that paper. \* \* The Annual Report of the National Dahlia Society, 1903.

## Trade Notes.

### Ant. Roozen & Son's Bulb Catalogue.

No more complete catalogue of Dutch and Cape bulbs exists than that of Ant. Roozen and Son, of Overveen, near Haarlem. It is not an illustrated catalogue, but its alphabetical arrangement and clear descriptions, together with the concise cultural notes given under each genus, makes it a book of reference for all who grow bulbs; and as such we recommend it. The London agents of this firm are Mertens and Co., 3, Cross Lane, St. Mary-at-Hill, E.C.

### Messrs. Baker of Codsall.

Under the laconic title, "Bakers' Nurserymen and Seedsmen, Wolverhampton," we have received a notice of the establishment of this new firm. The manager is Mr. G. W. Kerr (late of the staff of Dobbie and Co.), and besides the Old Hall Nurseries at Codsall, Staffs., the firm has opened a shop and offices at 67, 69, and 71, Lichfield Street, Wolverhampton. The nursery amounts to about 100 acres, and there are specialists for every department. Cottages have been built for several of the workmen, a fine residence is in course of reconstruction for Messrs. Baker, a villa for the manager, and a huge packing warehouse, with the necessary offices, has been erected in a convenient position. Underneath this warehouse are dark cellars for the preservation and for the retarding of bulbous roots. A portion of the ground has been already covered with glass—some 60,000 feet—and the glass is being rapidly extended. In five of the glass houses no less than 14 tons of Tomatoes have been gathered this season. The firm has nearly 40,000 Roses, which have been budded this year. Chrysanthemums are a speciality, for there is now to be seen a magnificent batch of 20,000 in pots, whilst there is also a very fine collection of the early flowering varieties. Of Dahlias there is already a good assortment. Herbaceous plants will ultimately cover ten acres of land.

## Necessary Repairs in Farm Buildings.

When the cheerful blaze of the parlour fire is a thing to be most appreciated, as it is this September 14, the evening we pen these lines; when the rain is pouring down in torrents at least every alternate day, and the wind remains persistently in the N.E., we begin to wonder how soon we must be before we fetch up the stock to winter quarters in the yard and sheds. There is plenty of food still in the fields, grass in abundance, much of it rank and coarse; but still, with the help of hand food might keep stock going for some time. But the continued rains and unusual cold will cause a great falling off in the condition of the stock, and we prophesy a long winter within four walls.

Landlords in the matter of repairs are slow to move. It is not that they do not appreciate the necessity for action, but they know that work once begun takes time, and that bricks and mortar are most costly. Of course, it will be said that work should never be allowed to fall in arrears. Quite true; but do not other people beside landlords rather like to put off the evil day? A stitch in time—we all know the proverb—and a bit of mortar or a few bricks inserted at once will prevent a great breach in the future. Some farmers, too, are very loth to bother a good landlord on petty matters; would rather go on the as-we-were principle. Others, again, hate to take steps which appear only to irritate the agent and put his back up. In the days of farming prosperity the occupier would generally do all sorts of little jobs himself, and say nothing about them; that is, would cheerfully pay out of his own pocket. We know of one set of farm premises that were practically re-modelled by the occupier during a long tenancy; not only were the buildings put into good working form, but the dwelling house was improved and smartened. With what result? That on the father's death the son found it impossible to come to terms with the

landlord, and the farm was cut up and let at a very low rent to a class of men whose sole object is to get what they can out of the land, putting nothing into it. We could quote many other cases where tenants not only have received no help towards necessary repairs, but have been given to understand that they should feel much obliged to think they had been allowed the privilege of setting matters straight. We have in our mind just now some farm buildings, or, rather, ruins we might almost say, that loudly call for repair before the storms of winter—cow houses, or, rather, hovels, wherein no cow can expect to be even moderately comfortable, where last winter several were seriously ill from prolonged colds, and where none could really be expected to yield their proper quantity of milk. The agent has been interviewed, has been written to, has been reminded of his promise, and yet the tenant still waits. The stables are equally bad, and the barn not weatherproof. Of course, it will be said, Why not leave? Notice was given last year, but withdrawn on the distinct understanding that needful repairs should be executed at once. The tenant is elderly and in bad health, and would rather not move if it were possible.

Now as to general repairs on farms. What is the first point to be looked to? Rainproof stables and byres. A very small leak in a roof can soon make things most uncomfortable, and one tile gone, the next is soon loosened. The same will apply to slates. Thatch is not much used now, and where it is there is not the least excuse for a dripping roof; there is always at least one man on every farm who knows how to make a stack rainproof, and the materials are not costly. Next to the roof, as we are on the question of water, is the spouting. Broken, bad spouts will disgrace any building, and not alone disgrace, but absolutely do great damage to the foundations, let alone the misery of the more than continual sloppiness on a wet day, causeway, yard, all of a flood; a waste of that very water which may be so urgently needed next summer. And in the case of buildings which "give" on the new yard this extra and unnecessary water is distinctly baneful to the manure, washing out valuable and costly constituents.

Now we will just look inside again. Are the floors of stable and cow house firm and unbroken, or are there dislodged stones, blocked up channels, broken grates? A properly laid level floor is so much easier to make and keep clean, and will not harbour any filth. We said level floor, but there must be sufficient slope to permit of the falling into the gutter of liquid portions of the manure. Doorways are apt to get much trodden down, and woodwork, windows and doors, too, may need some trifling repair. As for inside cleanliness, we ought not to have to mention it; but cobwebs and dust lurk in unsuspected corners, and ere spring comes again will accumulate to an alarming extent. Remember, the milk cows practically pass the whole of the winter under cover, and at least let their quarters be clean to begin with. There is nothing like lime-wash and sunshine. Limewash is within the reach of all; and give a chance to the sun to show his face by keeping windows clean. Also remember that hot air is not all that is needed; it must be pure as well as warm, and to this end just give more than a passing glance at the ventilators.

There is just another point. On most farms of any size during the winter months there is great steaming of food. In what condition is the boiler? Is all the apparatus in order? A breakdown in the cold weather, and when fattening pigs are up, is no little matter. At any rate, the steam house will be none the worse for a bit of cleaning, and surely during these broken days, when outdoor work is at a standstill, the ordinary farm hands might get all the premises into fine order. There generally is one man a bit of a carpenter, a handy man, and if he has a few tools he will soon earn in unconsidered jobs a good day's wage. Fasteners on doors and windows claim attention. A door or window for ever banging destroys itself more quickly than by years of actual service. Pulpers and cutters should be looked over, and worn parts renewed. The careful eye of a master will note many things that would be the better for a little attention at once; repairs have to be made sooner or later, and sometimes the breakdown comes at a most inconvenient moment.

### Healthy Sheep.

Enough of this subject. A week or so back we referred to the great losses among sheep in the year 1880, from liver fluke or rot, the result of the wet seasons of 1878-79. Flocks

that had never suffered before were decimated then, and we much fear that 1904 will see similar disaster. We would urge all flock owners to keep off low-lying, unsound land, which most surely breeds the pest. Sheep are not by nature fitted for wet meadows; high and dry they should lie, if possible. The danger of liver rot is just now. Now is the time that ewes may contract the complaint that only ceases with their death. They will not die during the winter or early spring, but as soon as ever they have lambed they begin to waste away, and no power can stop them. We have seen it over and over again, and any old shepherd will corroborate all we say, and probably will use far more forcible language. Some readers will aver that they have difficulty in finding high, dry feeding grounds just at this season. The effort will have to be made if the breeding flock is to be kept healthy. The time of inconvenience may be shorter or longer; it just depends upon frost. Given a sharp, severe frost, all danger even of wet pastures is at an end. But it is well to bear in mind if the frost destroys chances of liver fluke, it does not permanently improve low-lying ground, which can never under any circumstances be good sheep lair.

We have spoken about the ewes and their preservation, for two lives depend on their welfare; but the lambs, too, need safeguarding. Get all lambs on to arable ground. Cabbage, Kale, Rape seeds, and Turnips—any or all of these will prove most safe and valuable lamb feed. The lambs will be preserved in health, and the land will be benefited by their presence.

Those of us who are interested in the autumn lamb sales will note with satisfaction that at last the railway managers see their way clear to lowering the rate of ram carriage. The new rates came into operation on September 1, and will prove a great boon to many a purchaser. It is not often that the British farmer gets any favour from the railway companies; their favours are reserved for the foreigner.

OLD RATES.				NEW RATES.			
	s.	d.			s.	d.	
50 miles	8	4	...	1 ram	...	6	3
100 "	16	8	...	"	...	10	5
150 "	25	0	...	"	...	12	6
200 "	33	4	...	"	...	14	7
300 "	50	0	...	"	...	18	9

This should do something to help up the price of sheep and to distribute good sires.

### Work on the Home Farm.

The harvest is still the engrossing task, but we are glad to say it is nearing a conclusion. Although we have not been without showers they have not been heavy enough to stop leading of Wheat or Barley, and even of Oats in one case. There is no Barley about here stacked in condition for threshing at once; in fact, it should all stand for quite two months. But the maltsters will want it before then, and they will probably grumble a good deal when they get it. It has lost colour sadly, but is of nice body and curl, so it should make good brewers' malt.

The last night or two have been distinctly frosty, and we hope will have checked the progress of Potato disease, which is very prevalent amongst earlies and second earlies, such as Mona's Pride and British Queen. No disease can be found yet amongst the late sorts, but the haulm is dying rapidly. Some stacks were thatched when rain prevented leading, and the remainder will have to be done before the men can go to other work.

The seed land will want ploughing ready for Wheat drilling, and it must be ploughed at once. That will occupy the horses until the Potatoes want lifting, so there will be no time for autumn fallow. The only alternative is to employ steam power, but the nearest steam tackle is full of orders for weeks, and other sets are too far away. Farmers were growling both last autumn and in the spring about the difficulty of getting steam diggers. The way out of the difficulty is to co-operate and buy one for the sole use of the combination. They are most valuable articles, especially after a late harvest, which shortens the available autumn time, as by their use we can complete necessary work which otherwise would have to remain undone.

Ewes which will be mated with the ram at the end of the month should be dipped at once. We notice that county authorities make orders for compulsory dipping, and then reseind them. Sheep dipping is evidently a question which cannot be left to local option, but must be made entirely comprehensive.

Feeding pigs need full rations now. As soon as a sufficient supply of Potatoes is available the steamer must be brought into use. Although many pigs will thrive on raw Potatoes and meal, there are few which will not pay for the expense and trouble of the cooking process.

# Barter's WILD GARDEN BULBS.

OUR SELECTION OF  
DWARF - GROWING INDIGENOUS  
AND OTHER BULBS,

Adapted for Rockeries, Sloping Banks,  
Odd Corners, and Naturalization.

CONTAINS

1,100 Fine Bulbs. Price 21/- nett.

Sent Packing and Carriage Free on receipt of remittance.

100 Aconites	100 Blue Grape Hyacinths
100 Blue Bells	50 White Grape Hyacinths
50 White Bells	50 Feather Hyacinths
100 Star of Bethlehem	50 Chionodoxas
100 Fritillarias, mixed	50 Allium Moly
100 Snowdrops	50 Dogtooth Violets
100 Triteleias	25 Anemone Fulgens
50 Snowflakes	25 Anemone Apennina

Half the quantity, price 11/6. Packing and carriage free.

CARTERS WONDER BOX OF BULBS, containing 1,000  
Hyacinths, Tulips, Narcissus, &c., price 21/- nett.

Sent Packing and Carriage Free on receipt of remittance.

## CLIBRANS DOUBLE PRIMULAS.

EXCELLENT for cutting or as Pot Plants. We  
offer the following choice varieties, strong  
healthy plants, in 3in. pots, at reduced prices.

	Each.	Per doz.
Alba Plena, pure white ..	9d.	8/-
Annie Hillier, light pink ..	2/-	20/-
Candidissima, the best white ..	1/-	10/-
Earl of Beaconsfield, rosy carmine ..	1/3	15/-
Marchioness of Exeter, white speckled pink	2/-	20/-
Stewartii, double red, fine ..	1/6	15/-

### CINERARIAS

from stores, 1/6 doz.; in 3in. pots, 3/6 doz.

### CYCLAMEN

in 5in. pots, set with buds, 12/- and 18/- doz.

### PRIMULA SINENSIS

to colour, or mixed in 3in. pots, 2/6 doz.

All above prices are special to this Advt.

Are invited to inspect our stock of

**TREES & SHRUBS, FRUIT TREES,  
ROSES, RHODODENDRONS.  
EXTRA STRONG FRUITING VINES,  
STRAWBERRIES IN POTS, &c.**

We have a large stock of the following—

Box, in variety, 2 to 4ft. (30,000).  
Golden Yews, in variety, 1 to 3ft. (20,000), and Large  
English Yew. [Specimens.]  
Cupressus, in variety, 2 to 6ft.  
Retinosporas .. 1 to 6ft.  
Spruce Fir, 2 to 6ft.  
Norway Maple, Sycamore, Mountain Ash, Birch,  
Poplars, &c., 8 to 16ft.  
Hollies, in variety, fine specimens, 8 to 12ft.  
Standard Acer Negundo var. (5,000).  
" Prunus pissardii.  
" Thorns, in variety.  
" Laburnums  
Flowering shrubs, Spiræas, Deutzias, Philadelphus,  
Lilacs, Laurustinus, Olearia Hastii, Berberis,  
St. John's Wort, &c.  
Evergreens, Aucubas, Portugal Laurels, Laurels  
in variety, Privet, &c.  
Standard Apples, Cherries, Pears, Plums, Damsons  
&c., in large quantities.

THURSDAY, OCTOBER 1, 1903.

## Fruit and Vegetables at Chiswick.

HERE was a little touch of  
sadness about the magnificent  
display of vegetables which was  
opened to the public on Tues-  
day last at Chiswick, because  
everyone realised that it was the  
last of many fine shows held in  
the historic gardens. One felt a little  
regret that it was the final, and hence-

forth Chiswick will be a place of shows no more.  
Memories crowded themselves so thickly the  
one upon the other of the famous shows that  
have been held and of the renowned gardeners  
who have met in the dear old gardens at  
Chiswick; and though, by sheer force of cir-  
cumstances, the scene of many triumphs must  
be closed for ever, so far as horticulture is  
concerned, it must be generally admitted the  
last great show was worthy of the occasion.  
Proud indeed must those individuals have felt  
who were mainly responsible for the intro-  
duction of the vegetable division, because of  
the magnificent display of useful produce dis-  
played; proud also must the Council of the  
Royal Horticultural Society have felt of the  
last Chiswick Show, and proud also everyone  
present who has any pride in British horti-  
culture.

In this short general survey it would be  
hardly fair to mention names without including  
each and all who did so much to make the show  
such an unqualified success. It is only fair to  
say, however, that, considering the circum-  
stances, a finer exhibition of the products of fruit  
and vegetable gardens has rarely been displayed  
to public view. Indeed, one gathered the im-  
pression that exhibitors, one and all, both  
trade and private, had combined in one united  
effort to make the final show worthy of the  
reputation and records of Chiswick. Cer-  
tainly the competition in many respects was  
keen, but the main idea on the part of

READERS are requested to send notices of Gardening  
Appointments or Notes of Horticultural Interest,  
intimations of Meetings, Queries, and all Articles for  
Publication, officially to "THE EDITOR," at  
12, Mitre Court Chambers, Fleet Street,  
London, E.C., and to no other person and to no other  
address.

everyone, including exhibitors and officials, was to do his best, and the best can hardly be overrated.

In some quarters somewhat gloomy forecasts were made regarding the shows, which were certainly justified, considering the unfavourable season now drawing to a close, but there is a common saying that, no matter what the season may happen to be, there is always something good to be seen at shows. This was certainly true so far as it applied to the Chiswick Exhibition, and it afforded proof of the British gardener's capacity for overcoming climatic difficulties. We may fairly say that we have no ambition to see a finer display of vegetables, and if there were any doubts about a vegetable show being of sufficient interest to attract the public, we hope the Chiswick display has removed it. Fruit has, perhaps, been better shown and in greater quantity, but think of the season, realise the fact that the country is generally fruitless, and it will be agreed that this division was an unqualified success.

We are writing only of the first day, when the attendance seemed good, and though it did not include the select members of Society, such as may be seen on the green sward in the Temple Gardens, it was comprised of an interested, practical, hard-headed collection of horticulturists, who for the most part knew and understood the points of the produce staged. They criticised in some cases, and admired in the majority, and many, we think, went away with the acknowledgement to themselves that there is a good deal to be learnt in the art of growing and staging high-class fruit and vegetables. We can only hope that this, the first great combined show of fruit and vegetables held under the auspices of the Royal Horticultural Society, will be the forerunner of many others. This sentiment, if we mistake not, was shared by the various members of the horticultural fraternity who trooped from Chiswick, having visited its last show in the late afternoon on Tuesday, to join in the first, but we hope not the last, gathering of its kind—the gardeners' dinner.

## The Rise of the Daffodil.

The great Daffodil Conference of 1884 opened up new possibilities, and hybridisers were soon at work, and seven years later new Daffodils were being put before the R.H.S. Daffodil Committee for honours. Prices went up, and now you can buy a Daffodil for 700s. One lady paid a few years back 1,000s. for one named after her. I knew an amateur who sold his watch to buy a new Pansy. A poor weaver at Nottingham walked twenty miles to get a little offset of a Tulip, for which he paid 10s., when someone suggested to him, would it not have been better to have spent the money on shoes for your children? but that friend was not himself a collector. A former clerk to Billingsgate Market bought at a public auction some fifty or sixty years back, for the sum of seventy odd pounds, a variety of Tulip to add to his collection. During the Tulipomania in Holland, a man exchanged a carriage and pair of grey horses, with all the trappings, and £300, for a Tulip. What the future of the Daffodil craze may be I should not venture to forecast. I have heard of a syndicate of amateurs who have given a Daffodil raiser £500 for a portion of his new Daffodils, and a trading firm have invested £500 in the same man's new varieties.

While the taste was growing in Australasia Mr. G. S. Tithe-ridge, the well-known theatrical artist there, was smitten with Daffodils, and became the exponent and special pleader of the family in his own fascinating style, as he travelled from town to town and mixed with the flower-loving amateurs. Mr. Triggs, Wellington, New Zealand, also a gentleman at The Hut, near Wellington, were early pioneers in cultivating and spreading the taste for Daffodils by allowing access to their collections. Mr. Triggs frequently lectured on the beauties of the flower. At Dunedin, New Zealand, the same progressive spirit was manifested in the headmaster of the Boys' High School lecturing on all occasions, and getting his townsfolk to become Daffodil amateurs.

The leaseholder, or, as he is called, "King of the Isles of Scilly," and his tenants derive a large annual income from the flowers I popularised. Some six years ago I chanced to meet Mr. Dorrien-Smith, and he informed me that he and his tenants had shipped that year to the mainland 150 tons of cut Daffodil flowers. A few years before that time, when on a visit to him, he was proud in telling me fifty tons has been shipped that spring, and he seemed to think he had about reached the limit. The quantity he now ships, supposing that the development has gone on at the same ratio of increase, should be about 300 tons.

In the Colonies of Australasia, especially Melbourne, the flower boys sell an immense quantity of Daffodils, "Princes" being the favourite, and as there are warmer and colder climates within a few miles of Melbourne, for many weeks in succession the Melbourne public can have their posy of Daffodils for a few

pence to adorn their rooms. Indeed, the Melbourne people have Daffodils in one form or another for several months.

To show the interest taken in these flowers, when chatting with the members of the Horticultural Society of Dunedin, one man told me that he had travelled sixty miles to hear what I had to say on the subject of his favourite flower, and for weeks after letters of invitation were following me. At Dunedin and Invercargill I was made a life member of their horticultural societies.

In Tasmania the Daffodil amateurs are numerous, and both here, in New Zealand, and Australia I found holders of the newest Daffodils, costing from 200s. to 300s. for one bulb. These were very advanced Daffodil amateurs.—(From an essay on "Ancient and Modern Daffodils," by Mr. Peter Barr. V.M.H.)

## Garden of the Royal School, Bath.

The position of Mr. Drew as gardener to this College at Bath is not at all an enviable one. The reasons annexed are that the soil is a stiff, hard, unyielding clay, cold and most ungenerous to the tiller; and while the ground is so unconquerable, the aspect lies high and exposed, and Bath is a hilly place without a doubt, swept, too, in places by winds the reverse of tender. Yet here has Mr. Drew lived and laboured for full twenty years, keeping and dressing, planting and sowing, and to some purpose, too, as I will presently show. He speaks in terms of the warmest praise of the Principal of the College, whose kindly addresses have been the mainspring of the gardeners' persistence.

Truly, April is not the time to see a garden aright, but facts can still be gleaned. To start with, I was shown an exceedingly fine plantation of Sovereign Strawberries. This amounted to half an acre; yet from so small an area the yield in pounds avoirdupois in 1902 was 1,100, making an average of 11b per plant. The cultural practice is to take the runners in August, grow on the plants, but nip off their flowers during the next summer, and allow them to fruit the year after that; or, in other words, at two years of age. They are planted 2½ft apart, and liberally treated.

Dessert ought to follow dinner, but here I have served it first. However, to Cabbages; and perhaps few have heard of a variety of Cabbage named Goldfinder, but from what I saw of it here it is a gem for spring work, forming neat conical heads that are firm without being hard. Mr. Drew has grown the variety for thirty years, and before him his father grew it. As the old gentleman has a well-experienced son in charge of a large southern garden now in the making, it will likely become an heirloom (!) and some day may "bolt" (in a double sense) upon the world with a great history behind it. An early summer sowing gives plants fit to plant by the end of September, and these are cut in March. Broccoli are well done; and from one acre, a sufficient supply of Potatoes for an establishment numbering 140 persons is generally available. The varieties depended upon are Up-to-Date, Beauty of Hebron, and Snowball.

In the way of fruit trees, the Victoria Plums make a good showing, and a crop of half a ton was taken in 1902 from a very few trees. There are no fine fruit walls here, yet this does not minimise the productivity. Extra credit is due to the gardener in this, that he not only tends them personally, and that at a disadvantage, but he has raised them and grafted them himself.

In this garden, ere we quit it, the visitor will further observe that it can produce a good Yew hedge, for there is one here going up 9ft high, and the same in breadth. What a growth! And how long was it in developing these proportions? This I cannot tell. That Mr. Drew has plenty to do, and has many drawbacks, no one who has been over the fourteen acres of college grounds and gardens will controvert, and that he does his duty well, will also be undisputed. His vegetable quarters, his fruit trees, lawns, and his long flower border bespeak an anxious, assiduous man, and what I have told of the soil and aspect further emphasises the courage he evinces in his labours.—H.

HYBRIDISTS AND "HEREDITY."—In a recent lecture Mr. Bateson said that hybridists were all limited in their operations by the laws of heredity. To everyone it was a personal question—What had he got from his forbears?—How much was he likely to imitate the qualities of his parents? The means they had of solving this problem were based on the discovery that Mendel made. That discovery was, in the cases of the crossing of Peas, that each germ cell would carry, not whole characters of the parent that produced it, but some of them. The first problem was—What were the laws that governed the segregation of characters? The second was—What would happen when these different types met each other in fertilisation? It often happened, he added, that hybrids produced, instead of two parental types, a whole series of types, and that each had a different behaviour in heredity. These were, for the most part, forms with which the practical breeder was concerned, and by knowledge of their properties he would be able to fix such types as he needed with certainty.

### *Cattleya Schilleriana* Lowi.

This form of a handsome Orchid was certificated in 1892, Messrs. Low and Co., now of Bush Hill Park, Enfield, being the possessors. The sepals and petals are green, and are thickly furnished with brown spots. The lip is pale purple, streaked with white. The throat is tinged with yellow. It is a pleasing and desirable variety.

### Rare Orchids at Kew.

The editor of "The Orchid Review" remarks: "Several very interesting rarities are now flowering at Kew. *Dipodium pictum* is producing another spike in one of the warm houses, where also may be seen a fine plant of the remarkable *Bulbophyllum grandiflorum* bearing seven flowers, the rare *B. mandibulare*, the curious little *B. saltatorium*, with a feathery lip, like a miniature *B. barbigerrum*, the striking *Trias disciflora*, *Saccolabium penangianum*, and *Liparis disticha*, the red flowers of the latter being rather unusual in the genus. *Phalænopsis Esméralda* is represented by five flowering plants; and a pan of *Habenaria carnea*, containing several plants, is very effective. Among plants which cannot be called rare may be mentioned *Paphiopedilum Charlesworthi*, *P. Spicerianum*, *P. x Maynardi*, *Phragmopedilum x Sedeni*, and *P. x calurum*, all of which are flowering freely and are very effective.

"Among showier things may be mentioned a nice lot of *Dendrobium Phalænopsis*, *D. formosum*, *Lælio-Cattleya x Nysa*, *Vanda Kimballiana*, *Cattleya Loddigesii*, *C. Aclandiae*, *C. Eldorado Wallisi*, *Miltonias*, &c., which collectively make a fine show."

### The Week's Cultural Notes.

Pleiones will by now have finished their growth in most cases, and water must be withheld almost entirely. The roots usually die off naturally as the foliage falls, consequently the water will be useless. As the flowers develop in the young growth roots again make their appearance, and no time should be lost when once the flowers are past before giving new compost. Some growers use large flat pans for their Orchids, but they are even prettier in small pots or baskets, many a group being brightened through November and December by pots of the pretty *P. lagenaria* in full flower around the edge.

Fibry loam and chopped sphagnum, with a liberal sprinkling of finely broken crocks and charcoal, form a good compost, and the surface of this must be kept just below the rim of the pots. In shaking out the old bulbs and repotting, considerable care is necessary that the young roots just starting are not injured, while if these can be anticipated it is naturally all the better. But this cannot always be, as they sometimes appear before the flowers are past. Leave a little of the old roots attached to the bulbs, as this will help to stay them in position and allow the base of the bulb to just rest on the surface of the compost.

From two to three weeks will elapse before any root moisture is necessary after repotting, the longer time being in case of very cold weather. In no case must it be given until the roots are starting freely. Where a collection is grown, the time for these operations will vary in accordance with the time of flowering, but the procedure is practically the same with all the species. *Miltonia vexillaria* is still growing strongly, and must not be checked for want of water at the roots, but as the atmosphere is now moister the supply will not need to be so often repeated. Other species, such as *M. spectabilis* and its varieties, *M. Clowesi* and *M. cuneata*, will probably be finished, and very little root moisture will be needed.

There is still time to repot late plants of *Cattleya Dowiana aurea*, *C. gigas*, *C. Hardyana*, *Lælio-Cattleya Dominiana*, and nearly related kinds, and, of course, while re-establishing themselves root moisture will be needed, but earlier plants that have finished their growth must have the water supply much reduced. *C. Warneri*, or the spring flowering *labiata*, as it is called, will soon be starting to grow again, but only a limited supply of water is necessary, as well as a light, sunny position, to induce as hard and vigorous a growth as possible. The fact of making its growth at the dullest period of the year militates a good deal against the well-being of this beautiful and distinct plant.—H. R. R.

## The Alpine Garden.

This branch of English flower gardening, which throughout the whole year never loses its charms, has nevertheless at this season lost that brilliance and effectiveness which are charac-

teristic of it throughout the spring and early summer months. It would be well, therefore, now that the autumn is advancing, to lose no time in carrying out any alterations or replanting that it may be necessary to have done. There can be no question as to the advantage of autumn planting over that of spring, for given a fine autumn, or even let the autumn be what it may, the plants rapidly make new roots, and by the advent of severe weather are well established; which is an immense advantage when the season of growth and activity returns. It is true a few plants may be lost during hard winters, but this is more than counterbalanced by the progress which the survivors have made.

The occupants of a rock garden will not, as many have found out, continue to grow and flourish in the same position for an indefinite period without soil exhaustion taking place; consequently, the plants become weak and gradually dwindle away, and we wonder why they don't succeed. An occasional lifting and manuring or renewing of soil does not appear to enter into the calculations of many people; yet it is essential if we would have the best results. It is probably owing to this fact that there are so many failures, not only with Alpines, but with other plants as well, which are put into a given position and expected for an unlimited time to give good results without further trouble, except the merest routine. As soon as it becomes evident that a plant, or group of plants, is on the decline they should

*Cattleya Schilleriana*,  
var. *Lowi*.

be promptly removed, taking out the soil to the depth of 18in, replacing by good loam, leaf soil, peat, and grit, as the needs of the plants require, with the addition of small pieces of chalk or limestone for those that need it.

In order to meet the demand for young plants occasioned by exhaustion, change of plans, and other causes, it will be necessary to systematically propagate a number of plants each year. For some plants division will offer the only means of increase; others which are known to come true may be raised from seed, but in some cases this is a slow process. For the greater number of plants, however, cuttings will form the best means of increase, and should invariably be employed for varieties of the same species; by so doing the different varieties are kept true, there being no variation from the parent plant, as is often the case with seedlings. For this purpose a cool, shallow frame will be required, into which should be put a few inches of loam, and leaf soil, and over this a layer of 2in of sand.

The cuttings may be taken as procurable from April until September, inserting them 2in apart and carefully shading. As they become rooted pot them up into small pots, and plunge in coal ashes until such times as they are required. By this means a supply of young plants will be forthcoming each autumn to replace those that it has become desirable to remove. It is only by continuous replanting and careful attention that we can keep our rock gardens stocked with healthy and vigorous plants, which by their wealth of bloom and beauty of form and foliage, will repay us for our care, and gladden our hearts throughout the four seasons of the year.—S. P.

### Roses at Waltham Cross, Herts.

The visitor to the Royal Nurseries of William Paul and Son can see Roses in flower at all seasons of the year, and the out-of-doors display in late September is quite rich and plentiful. Notwithstanding rain and winds, the flowers are exceedingly fair, firm, and full. The record of our visit there pertains more particularly to the novelties, to which attention was drawn, and the fact that good flowers were carried by many of them points to the fact that the autumnal character is well developed. Naming a few that linger in the mind, a prominent place must be accorded to Earl of Warwick, a lovely flesh-tinted-and-rosy flower, with salmon glow, of beautiful pointed shape, smooth petals, and large, firm flower. The title was suggested by the Earl himself, who was greatly charmed with this fine seedling. It seems likely to be vigorous, and in all ways good.

In the same line with this was Countess Cairns, a distinctive variety of a pale rose, shaded delicate pink colour, the flowers well held up, long in form, and strong, good shape. Mr. Arthur W. Paul speaks highly of it.

Dainty is a gem, the colour being of a delicate, soft primrose, unequalled for softness of tone, and the other parts of the petals are prettily suffused with carmine. The flowers are round and plentiful, making a good show when massed in beds, (T.) And another bedder, which we are certain will come to the front, is Morning Glow, a Tea Rose, of dwarf branching, robust habit, producing reddish growths, and a heavy crop of exceedingly rich-coloured little flowers. These are of a rosy-orange combination, the deeper tones, as crimson, being blended, so that the flowers are much in keeping with autumnal resplendency, and will harmonise with a background of reddish-coppery shrubs and trees. This is not carrying a colour scheme too far; by no means, for our shortcomings as planters are that our plans and arrangements are too trivial. They lack amplitude and detailed connection.

Along with it, one cannot forget another newcomer, but which has already "taken hold," and that is Soleil d'Or, whose habit of growth in the nursery rows may be mistaken for the Manetti Rose. This fact will confirm the reader of its vigour and handsome wood-and-foliage growth; while all who saw the grand golden masses (I should say, golden-orange crimson) of cut flowers presented by some of the competitors in decorative classes at the Temple Rose Show this year, will be at one as to its gorgeousness. The latter is just the right word to use, for the blossoms glow in their intensity and fulness of colour. It is, as most are aware, a hybrid of the Austrian Briar.

Passing on one hand a great rampant mass of the new Waltham Rambler, it was at once apparent that this, at least, was no consumptive, and what a splendid plant it is, with its huge panicles of rich pink single flowers having a pure white centre! These, of course, were not to be seen in the third week of September, but all through the summer its yield is certainly heavy. Near by, on the left, we have a hedge, a round-backed hedge of the new Golden Queen, a lovely flower, after the Rêve d'Or type, but, like that beautiful Rose, seemingly rather shy in flowering. The growth will cause no anxiety, at least not on the point of delicacy, and the plentitude of dark crimson shoots and foliage is alone very handsome at this season. It may be remembered that we figured this Rose in July, 1901. Maréchal Niel out of doors is very strong and healthy at Waltham. And a third good yellow climber is found in Billiard et Barré, a robust Tea, with effective golden-yellow flowers, decidedly one of the best.

It is well known that Mr. Arthur W. Paul takes every opportunity to vaunt the decorative merits of the species of *Rosa*—*rubrifolia*, *lucida*, *rugosa*, *virginiana*, *Harrisoni*, and others, and the most ornamental of them could be noted side by side in the nursery brakes. It is incomprehensible why such a comparatively limited supply of these fine subjects find their way to the gardens of English estates. The double pink flowered Mercedes, a *rugosa* hybrid, and Conrad Meyer, can each be used to grand effect.

## Sir William Jackson Hooker.

(Continued from page 291.)

"In 1808 my father undertook a much longer journey in Scotland, accompanied by his friend Mr. Borrer. On this occasion he reascended Ben Lawers, Ben Lomond, Ben Cruachan, and Ben Nevis, and for the first time Schichallion, Ben Hope, and Ben Loyal. After visiting Mr. Brodie of Brodie, they went to Caithness and the Orkneys, returning to Sutherland. In a letter to Mr. Turner he thus describes their reception in Sutherland:

"We did not leave North Sutherland with the good wishes of the inhabitants, at least the lower classes of them, most of whom took us for French spies; or, what is worse in their estimation, sheep farmers. Daniel Forbes, who so often acted as our guide, was advised by some to conduct us by the worst way possible; by others he was told that he might be better employed. Our lad heard some saying that we ought to be flogged and sent out of the country. They have not the least idea of persons travelling for mere curiosity, and could not be persuaded that we were not come to do them some ill.

"The journey through the north of Scotland was performed mainly on horses or ponies, and the difficulties met with were such as can now be experienced only in the out-of-the-way parts of the globe. . . . In 1809 Sir Joseph Banks, hearing of an opportunity for a naturalist visiting Iceland, where he himself had been in 1772, suggested my father's taking advantage of it. This he did, and all the more eagerly from having as a boy read Van Troil's 'Letters on Iceland,' with a longing to visit the hot springs and volcanoes therein described. The opportunity was the despatch of a vessel, the 'Margaret and Anne,' with a letter of marque, chartered by a London firm, Messrs. Phelps & Co., for the purpose of obtaining a cargo of tallow. The venture was a risky one, for Denmark, to which country Iceland belonged, was at war with England; and the firm were enticed to undertake it by a Danish prisoner of war, Jorgen Jorgensen by name, who was now for the second time about to break his parole and accompany the ship in the interest of the firm.

"The 'Margaret and Anne' sailed on June 2, and on arriving June 21 at Reikevik, Jorgensen, finding that commerce with England was prohibited, effected a revolution in the island, proclaimed its independence of the Danish crown, and himself its 'Protector,' imprisoned the Governor, Count Tramp, erected a fort armed with six guns, equipped troops, remodelled the laws, established representative government and trial by jury, reduced the taxes, and raised the salaries of the clergy; all without shedding a drop of blood or an attempt at resistance on the part of the people!" We here omit an account of Sir William's reception, and with regret, the relation of exciting events connected with his return. His ship, the "Margaret and Anne," was set on fire by Danish prisoners of war who were on board. "Unfortunately, the fire broke out on a part of the ship where his collections were stored, and he lost everything but a few weeks of his journal, the clothes he stood in, and an Icelandic lady's wedding dress which the ship's steward flung into the boat as she shoved off from the burning wreck.

"Soon after his return, and yielding to the wishes of his friends, he commenced writing his 'Journal of a Tour in Iceland.' On hearing of this Sir Joseph Banks most liberally offered him the use of his own manuscript journal and various other papers relating to the island, together with the magnificent drawings of the scenery, dresses of the inhabitants, &c., which were made by the artist who accompanied him in his voyage in 1772. With these materials, his own journal of four weeks out of twelve which he passed in the island, and a retentive memory refreshed by a reference to all available works and all documents relating to the revolution, he compiled and printed, for *private distribution only*, in 1811, an octavo volume of upwards of 400 pages and four plates. Sir Joseph Banks was so pleased with it that he induced my father to reproduce it for publication. The second edition with additions in two volumes, with two maps and four plates, dedicated to Sir Joseph, appeared in 1813, and is to this day a standard work.

"The years immediately following my father's return from Iceland (1809-12) were the most embarrassing of his life. His unquenchable longing to travel in the tropics was kept alive by Banks's earnest endeavours to find him a fitting opportunity. On the other hand, his botanical friends were unanimous in urging him to remain at home, publish his Icelandic and Scottish journals, continue his aid to Mr. Turner on the 'Historia Fucorum,' and above all proceed with his 'British Jungermannia,' his drawings and analyses of which were of unrivalled beauty, and his contemplated 'Muscologia Britannica.'

We next read that Sir William became partner with Mr. Paget (father of the late Sir James Paget) and Mr. Turner in a brewery at Halesworth, but, omitting some detail, may pass on to say that this did not check either his botanical ardour or desire to visit the tropics. "In 1810 he sold his landed property and determined to accept an invitation which Sir Joseph had procured for him, of accompanying Sir Robert Brownrigg, G.C.B., the newly appointed Governor of Ceylon, to that island. . . . To his bitter disappointment this opportunity had to be put aside, for disturbances, followed by a rebellion, had broken out in Ceylon that would have rendered travelling in the island impossible." Disappointment still followed, a contemplated visit to Java having had to be put aside. "My father was hence compelled to confine his wanderings to nearer home, adding gardening to his pursuits, and this with some success, for he was the first to flower *Cattleya labiata* in his little stove in 1818, and he also flowered *Musa coccinea*, and other tropical plants."

(To be continued.)

#### **Pear, Nouvelle Fulvie.**

This is undoubtedly one of the finest dessert Pears, and is ripe from November till February. The flesh is sugary, melting and juicy, and highly esteemed. The fruit, which is of medium size, changes to yellow when ripe, and on the sunny side particularly becomes dotted with russet, and frequently becomes rich crimson. We are able to figure a fruiting branch, by the kindness of J. R. Pearson and Sons, of Lowdham, Notts.

#### **Pear, Olivier de Serres.**

This French-raised Pear is another of the gems of our own home gardens, having the qualities of late keeping (February to March), a buttery, sweet flesh, and good as standards or pyramids, the latter, of course, preferred. As a wall plant, too, it crops well. Messrs. Pearson's illustration shows its fruitful character. The fruit is not large—2in to 3in wide, and 2½in high, and the skin is entirely covered with cinnamon-coloured russet.

#### **Budded Lilacs.**

In order to increase the newer varieties of Lilacs rapidly, nurserymen bud them on the California Privet. This gives perhaps fifty times as many as could be raised by layering in the same time. As many persons prefer that their Lilacs should not be over-large, the Privet stock furnishes what is wanted, the Lilac not growing as robust on it as when on its own roots. There is a tendency in the Privet stock to throw up shoots from the base, as a Manetti Rose will do, and this is an objection, though one not formidable. By cutting out all the eyes of the stock before planting, it ends the trouble. It can be met in another way—by planting the bushes deep enough that the stock is well underground. Very rarely is there any shoot on it then. It is sometimes desired that the Lilacs be on their own roots instead of on the Privet, even though budded on this stock. This can be accomplished by deep planting. Set the plants so that the true Lilac shoots are several inches under ground, and in the course of time roots will emerge from the Lilac, just as often occurs with dwarf Pears. Should anyone have plants already planted, dig them up and set them lower. It is the only way, unless practicable to mound soil about them. No doubt a little slit cut into the Lilac wood, just as would be done if about to layer it, would cause roots to form quickly.

#### **Hardy Fuchsias.**

To those who have travelled in California the sight of hardy Fuchsias of almost tree size is a pleasing and interesting one. The same is true (writes Joseph Meehan, in the "Florists' Exchange," America) of many portions of the South, free from more than a very few degrees of frost. Almost any Fuchsia will live outdoors if well protected with forest leaves about the roots; even here in the cold North. But the tops will be destroyed, the new growth coming from below the line of leaf protection. In the extreme south of England many of the more tender sorts get through ordinary winters unhurt, while the hardy varieties of *Macrostema* are quite hardy. The well-known *Riccartoni* is one of these, making big bushes, which are a grand sight in summer. Many cottages have it trained to the walls, the branches extending to the roof just as is seen in California. This variety, *Riccartoni*, is fairly hardy in Philadelphia. A few leaves placed around it on the approach of winter secure it, and when in a sheltered place it has been known to carry through the winter unharmed a small portion of its unprotected branches. Through July, August, and September the *Riccartoni* flowers profusely when in a damp, partly shaded place, a situation all Fuchsias demand. The native home of these hardy Fuchsias is Chili, which accounts for their hardiness above other kinds that have come from Mexico and other warmer countries. I was reminded to write of this, the hardy type of Fuchsia, by seeing a row of the variety *Riccartoni* in a Philadelphia florist's garden. The plants were in the perfection of health, and were fairly hidden beneath their wealth of flowers.

#### **Calceolaria 20ft. in Circumference.**

It is said that in the garden of Godolphin Vicarage, near Helston, Cornwall, there is a yellow *Calceolaria* which has attained the circumference of 20ft. It presents an attractive spectacle, as it is laden with a profusion of yellow flowers. It has never had any protection, and has been out of doors for the last seven or eight years.

#### **Pink Rambler Rose, Lady Gay.**

This Rose was raised by M. H. Walsh, of Woods Hole, Mass., U.S.A., and has been illustrated in the American journals. The variety shows much the character of *Crimson Rambler*, in luxuriance of flower and foliage, but the blooms are of a pleasing shade of pink.

#### **"Geraniums" in Boxes for Garden Decoration.**

A very pretty effect is to be seen at a farmhouse a few miles out of Exeter. Fronting the house is a strip of orchard ground, and placed here and there on the grass is a number of boxes containing large red *Geraniums*. There are a few other flowers about—*Dahlias*, &c.—but the mass of *Geranium* blooms at once arrests the eye, and compels one to make a closer inspection. The advantage of the boxes is, of course, that they can be removed at pleasure, or utilised in any way which the owner may desire. Here is a garden which is not a garden in the strict sense of the word, but it looks very pretty.

#### **Giant (Horse) Mushrooms.**

Writing to the London "Daily Express," the undersigned says: "The Ipplepen Mushroom of 36in circumference and its King's Lynn rival of 41in are relatively small compared with one which I have seen, and of which I hold the signed record of half a dozen witnesses, including myself. This Mushroom was found by my father's groom, William Parker, in July, 1871, in a field of mowing grass at Great Barr, Staffordshire. Its circumference was 63in, and that of the stem 9in; while the thickness through the flesh of the Mushroom was 4in. I have not heard of any authenticated instance of this size having been exceeded.—J. R. YATES, Colville Gardens, W."

#### **A Model Fruit Room.**

We believe that Mr. George Bunyard was the designer of the first fruit room of the pattern shown on page 316. Messrs. Veitch and Sons, Ltd., Chelsea, have favoured us with the representation of the fruit store in their grounds. The roof can either be thatched with straw or heather. The walls are of deal, with half a foot of air-space between the inner and outer boarding. The windows are set well back, and can have shutters in front. The floor is of earth, and the ventilation is mainly from the ends and the top. The stages for the fruits are 1½ft apart, with ½in interspaces between the boarding for proper dryness and the passage of air. These shelves are usually covered with selected straw, which lies with straight-lined stems, evenly. Properly made, these fruit houses will last two or three generations or longer, and suitable fruits can be kept soundly till May and June each year.

#### **Transplanting Evergreens Now.**

With the soil warm and moist, as it is at this writing, says Mr. J. Meehan, it would be as safe to move Evergreens with balls as it would be to set out pot plants; there would be no risk at all. The time is here, in fact, when Evergreen planting of all kinds may be considered. With favourable conditions October is regarded as a very good month for the work. At this writing the soil is damp and the air cool, and no better conditions could be desired. Even Evergreens without much ball attached could be shifted, with fair hopes of success. If an Evergreen can be moved and then tided safely over a week following, it is pretty sure to live. Unless under most unfavourable conditions, it should not be impossible to keep it up for a week. The main thing is water. Flood it with water when first planted; keep it soaked for a few days until it is well settled, and it will grow. The flooding compacts the soil better than pounding and treading it, hence is to be preferred. The more ball a tree has, the better it will do always; in fact, unless Pines have either been already shifted or root-pruned, it is difficult to get them to do well transplanted at any time. Still, if not large specimens, their transplanting might be attempted now, as well as that of other Evergreens.

### Apples and the Recent Gale.

I had business at Crediton on the 10th of September, and I had to take shelter in an arbour built under a large Blenheim Orange Apple tree. "Surely the roof is coming off?" I said to the parson. "O dear, no; it is only a few of the Blenheims falling on the roof." We have too many tall standards in this windy and rainy county of Devon. We need to plant more bushes. I was at Salcombe, about two miles from Bolt Head, the highest and most rugged coast in Devon and Cornwall, the day following the storm.

After tea with Dr. Twining, the gardener showed us over the fine fruit grounds. When we reached the bushes, but yesterday laden with fruits, the gardener, pointing to the Apples, said: "I owe this to you, sir; we never had fruit like this until you came here four years ago, and I left the Apples on the land, because I wanted you to see the crop that the trees have borne. You see what the storm has done!" About half the produce was on the bushes, and half on the land. Had the fruit been on orchard trees, perhaps nearly all the crop would have been on the soil. The bushes had been well thinned, and summer-pinched, thus giving a passage to the wind; and so much of the crop remained.

Here one has some of the advantages of growing Apples on the Paradise stock as bush trees. This view should induce growers to put many more such trees on their properties or holdings during the coming autumn. I am planting, this autumn, a large lawn, in a high position at the seaside, with the idea of a permanent orchard; but many bush Apples will be planted between. The owner wants an orchard, which is quite right, for he will thus protect his gardens. Yet he will never get the best fruit: dwarf trees alone can produce it. To buyers: Go early and select your trees. First customers carry off the best trees.—X., Devon.

### A Great Fruit Nursery.

Knowledge of the manifold operations necessary for success in fruit culture, and of the risks that are faced by large nursery firms who grow trees by the tens of thousands for sale, makes the visit to such a nursery as that of George Bunyard and Co., Limited, at Maidstone, of the highest interest and pleasure, as well as educationally helpful. Flat after flat, stretching to fully ninety acres, are covered with young fruit trees, each a replica of the other, and each a sermon by itself, as Prof. Drummond would have us see. But to remain practical, and leave philosophy for the divines, our attention will be devoted to the record of a visit made a week ago to the Allington Nurseries. These, as I note, extend to ninety acres of undulating ground, well exposed, and therefore admirably suited to furnish hardy, vigorous, well-seasoned stock. The soil is the finest in Kent, an ideal sandy loam of a reddish brown colour, that in every way tends to the production of fibrous rooted trees and bushes, which is so essential to the safe transference and thrifty growth of the subjects from nursery to garden or orchard.

The recent gales have slackened some breadths of juvenile Apple trees: but this will work out for good after a season when growth has been rampant and needs a timely check. The slackened trees, of course, will again be firmed by treading. Here and there, where a stout stake had left an unfilled hole, one was able to see the fleshy white root tips that lately had encircled the stake, which fact goes to show how active the root system is, and how speedily young, vigorous trees will "take hold" if planted while yet the soil is warm and moist.

#### NEW APPLES, AND OLD.

In going round the quarters, I asked my companion what account certain new varieties of Apples were giving. Foster's Seedling (1895) was one of these, and though stated to be hardly fit for dessert, it is a wonderful cropper, as becomes a seedling from Cellini Pippin. Golden Spire, I may say in passing, never fails to give a crop, not even in a year like the present, and I saw shapely pyramids laden with the yellow fruits.

Hambling's Seedling (1894) resembles the Blenheim, but on young trees it does not fruit freely. Early Peach (1894), "in the way of Irish Peach," bears out the catalogue remarks; but the Charles Ross has not been tried sufficiently long at Allington to enable the firm to speak of it from personal experience. James Grieve, "an early Cox's," and a hardy variety, is summed up in the sentence: "Good in every way; we think highly of it."

Young trees of Allington Pippin (sent out from here) were exceptionally clean and vigorous, making long, stout shoots, well set with fruit buds toward their base. Eaten when taken from the tree, the flavour of this Apple is of the best: juicy, sweet, and satisfying. Ribston Pippin, of course, will long remain a favourite, though I was informed (and this was new to me) that some folks imagine its popularity is declining, and have even evinced surprise to see such large breadths of it in the nurseries. It fails, of course, when old, being subject to canker. The recently introduced Russian Apple, named Bielo Borodawka, is well set.

One point, and a great point, is the high keeping of the Allington nursery, for neither weeds, prunings, or old stock are allowed a place. The scarifier and hoes are constantly kept at work; bodies of men move about among the trees as surface-men do on a railway track, and with a similar object, to prune, straighten, dress, and mend.

The King Pippin has been very vigorous this year, and makes a distinctive showing with its bluish green foliage. Cox's Orange on the Paradise, as yearling plants, are 3ft and 4ft high, and are good stuff. It is a mistake to plant Cox's in large brakes alone, as we fear has been recommended in places, for the failure of a variety is always possible, and more so if alternate rows of other varieties are not present to afford the cross pollination. "W. R. Raillem," whose garden I saw recently, has not a perfectly healthy Cox's in his place, the leaves being scourged with the rust which so peculiarly and constantly attacks this variety. He has grafted it upon Blenheim Orange and other varieties, but without lessening the affliction; and this is a drawback.

Standard Cherries, and, indeed, Cherries in all the modes of training, are a leading feature here, for the supply of the Kentish Cherry orchards; and in the journey by rail I had evidence of a considerable amount of recent planting. The Kent men are alive to the necessity of renewing their trees long before they are unproductive, and in this they show an excellent example to their brethren in the Brentford, Isleworth, and Hounslow districts of Middlesex, whose bogey for years has been the builder.

These standard Kentish Cherries are 7ft and 8ft high, with very shapely heads, the young shoots being spurred back to two or three eyes until the second or third year from the working, when they are let away, and require only moderate pruning. One of the nursery brakes contained 30,000 Cherry trees. Plums as standards, wall trained, or as pyramids were here in ample numbers, and of all-round merit.

If any reader of these notes visits Allington, he would do well to inquire for what may be called the "test orchard," the area where bush Apple trees are grown for the purpose of testing their merits over a series of years, and in order to provide a means of comparing one kind against another, as well as for the production of fruit for exhibition and other purposes. The object of the visit would specially be to see how well opened the centres of these trees are; quite like a great funnel, which allows the fullest admission of sun, air, and dew to work their beneficent changes.

#### ORCHARD HOUSE TREES.

The orchard house culture of Apples, Pears, Plums, Nectarines, and Peaches is carried out on a large scale, and a great number of the handsome dishes of Apples shown at Chiswick on Tuesday last have come from shapely trees grown first in a great span-roofed house, and latterly placed out of doors under a wire netting screen to finish off. The orchard house culture of Apples on a large scale is expensive, and though the size, colour, and beautiful appearance of the fruits are very comforting, the flavour is not quite equal to that of a cracked old Cox's from a scraggy orchard tree. This would seem to put a premium on "scraggy orchard trees"; but when a man handles and eats a magnificent Peasgood's or Gascoigne's sample, he hesitates to complain if the flavour falls short of his expectations, as judged from the outside.

The orchard trees, I may observe, are all excellent subjects, bearing well, and having nicely modelled forms. There are large numbers of all kinds in pots, plunged in the open ground.

Figs in pots receive the keenest attention, and pot trees, wall trees, and standard trees are kept in numbers suitable to the demand. The Royal Gardens were able to be supplied with standard Figs from the houses here when no one else could provide the stocks, and this tended to the firm receiving the Royal Warrant. Pot Vines form a department by themselves, and these are grown at Maidstone, the headquarters of the firm.

#### NUTS, AND FILBERTS, AND MIRABELLES.

The large quantities of Nuts seen in town shops now and later are mostly grown in Kent, and to meet the supply there are thousands of young bushes at Messrs. Bunyard's. The firm is engaged to plant four to five acres with Nuts in Buckingham during the present autumn, and the demand for Nuts is pretty constant. The differences of Cob Nuts and Filberts may be

subject to argument if it were worth while. The general definition is that the Cob is not covered by the husk, while the Filbert is. The old Kent Cob is still the best for general use.

The French Mirabelle or Cherry Plums are sometimes seen about in gardens where they are planted as ornamental dwarf trees, but their fruiting is precarious. The fruits are showy, and are sold in considerable quantities in the shops. Bullaces and Damsons, equally with the Cherries, cover many acres.

#### ORNAMENTAL TREES AND SHRUBS.

But while many scores of acres are under fruit, there are perhaps as many more containing Conifers and ornamental flowering trees and shrubs. The common Yew for hedges has been lately in great demand and the plants here range from 2ft to 3½ft high, being well clothed, bushy, and full of vigour. Those who are planting Abies might find a good subject in *A. Kosteri*, which is similar to *A. pungens glauca*, but has a better reputation at Allington. *A. glauca pendula*, in its young state, is not far removed in appearance either, and it, too, might find a place. One of the best of the Cupressus is *Triomphe de Boskoop*, a glaucous form of bushy, elegant habit.

The Shrubby Trefoil has not a great deal to commend it, though, when its clusters of fruit with greenish - primrose coverings, are freely borne, it has some effect in a shrubbery. A warm soil and sheltered position would seem to suit it best. The common Bay or Laurel, as well as the best of the Aucubas of a suitable size for planting, are here; and I was surprised to see so many variegated *Acer Negundos*, and Maidenhair Trees. Weeping trees are seen in all sizes, some of them 10ft and 12ft high, as were others of the trees, but these older ones are mostly sought after by people well on in years, whose desire is to plant for immediate effect. Beeches, Elms, Ashes, Willows, Birches, are all to be had in the pendant or weeping form. The Tulip Tree also does grandly on the Maidstone soil; and the same applies to Catalpas.

Large numbers of fancy Hollies had just been budded on the common Holly, and elsewhere there were nice young bushes. The golden Poplar is seldom seen, nor is the fine-leaved *Acacia*, named *angustifolia*, much in evidence. The Swamp Cypress, which is deciduous in winter, is cultivated in greater numbers than I had expected to see. *Parottia persica*, and *Celtis canadensis*, the latter with nettle-shaped leaves, are each worthy of attention.

The Hibiscuses are not at all shy in the grounds here, and quite a list of notable varieties could have been taken, each of them very good. The well-known *cæruleus* is certainly one of the best, and an unnamed white Hibiscus, with a dark eye, was another that specially attracted. The continental growers are, however, continually sending out so-called new varieties.

Rhododendrons are bushy and well studded with flower buds; attention being also called to the new Rhododendron-like shrub named *Daphniphyllum macrophyllum*, which has stood through five winters. The plants grow in rounded, bushy form, and have somewhat glaucous leaves. The Hypericums are a class by themselves, and I recently, in these pages, gave a list of the best of them as grown at Kew. The fine-leaved Sumachs (*Rhus*), that colour so gorgeously at the present time, deserve to be planted ten times more liberally than they are, and the same may be

said of the Azaleas. *Ligustrum Quihoni*, though of rather a loose habit, is nevertheless a grand autumn-flowering shrub, having showy white panicles of bloom. *Sambucus tenuifolia* (a fine cut-leaved form), and the golden cut-leaved Elder, used sometimes in bedding, are only two of a number of good varieties of this genus. *Viburnum acerifolia* and *Cornus sau-argentea*, a species with leaves that are coloured a white and purple mixture, would be welcomed if better known. There is also a goodly selection of bright-skinned *Salixes* or Osiers, of which the best known are *S. dasyclados*, *daffnoides*, *Salamoni*, and *vitellini*. The curb-leaved *S. annularis* (syn. *tortuosus*) is interesting if not beautiful. But there is no end to the shrubs if one was to name and describe even a decimal of the best kinds.

#### ROSES AND HERBACEOUS PLANTS.

Messrs. Bunyard cultivate acres of both Roses and hardy plants, and it must suffice to say that all the newer Roses of which we have recently heard, are being grown, together with popular sorts. Irish Beauty, the large white single, is doing best out of Dickson's trio in this line; and Gruss an Teplitz is also as profuse here and elsewhere. The dwarf Madame Levassieur, a polyantha with purplish-crimson clusters, was flowering freely in the open a week ago.

In the herbaceous grounds a few of the best subjects were *Senecio pulchra*, with long, stout stems, terminated with purple flowers of an inch and half diameter. This noble late flowering *Senecio* deserves some care, and its great needs are a warm soil and sheltered position. *Campanula muralis* *Elatines* is a variety seemingly with larger bells than the type, and is equally as profuse. This species is a gem for rockeries at the present season. Amongst the *Tritomas* or *Montbretias* were *Solfaterre*, with soft yellow racemes, and this is rather a refined variety; *Eldorado*, of a deeper yellow, and more robust; *Etoile de Feu*, very free, with large crimson flowers; *Globe d'Or*, a good golden

form; and lastly the ever useful and beautiful *crocosmæflora*.

#### PERENNIAL ASTERS.

So good were these, and the selection in my eyes so meritorious, that they deserve a separate head. Messrs. Bunyard are always adding to their collection, and weeding out the sorts that are superseded. *Aster John Wood* has pure white, large flowers, and grows 3½ft high. *Edna Mercie* is a showy rose-pink; *Daisy Petts* is another large flowered white, and quite distinct; *F. W. Burbidge* is rosy-lavender, 4ft; *Cottage Maid* is paler than the foregoing, and very free; *Edith Gibbs* has exceedingly graceful, fine wiry growth, and small pale blue flowers; *Margaret*, a Maidstone seedling, grows 5ft, and has fine lavender flowers tinged with rose, and is 1½in across. *A. puniceus pulcherrimus*, growing 6ft, is very suitable for the wild garden; *A. tomentosus* has pale mauve blossoms; *Amellus macranthus*, 2ft, has massive flowers and spreading inflorescences. *Royalty* also is good.

#### THE HEAD OFFICE AND NURSERY.

The centre of the business is at Maidstone, and round about it there are seven nurseries of varying size, each belonging to Geo. Bunyard and Co., Ltd. The firm touches all branches of outdoor nursery stock, and the florists' side of the trade is not neglected. If Allington falls to be visited again, as it surely will, something must be said of the bog and alpine plants, the Bamboos, Reeds, Grasses, Ivies, tender exotic plants, Violets, tuberous Begonias, Oranges, and many other subjects.—J. H. D.

Pear, Olivier de Serres. (See page 305). J. R. Pearson & Sons.

# NOTES & NOTICES

## Ipswich Gardeners' Mutual Improvement Association.

This society will commence its winter session upon October 1, when Mr. W. Seabroke, of Chelmsford, will discourse upon "The Culture of Apples and Pears, and their Commercial Importance."

## A Notable Gardener.

Mr. William Shand, a well-known authority on horticulture, died at Lancaster on Wednesday in his sixty-sixth year. He was a native of Banchoory, Kincardineshire, and was head gardener to the late Sir Robert Duff, Fetteresso Castle, Kincardineshire, and to the father of the present Lord Lonsdale, Lowther Castle, Penrith.

## Rare and Curious Trees.

Mr. H. J. Elwes, Colesborne, Cheltenham, writes: "It frequently happens that rare and curious trees which blow down or die are used as firewood, or sold at firewood prices, because no one takes any interest in them. As the uses and value of the timber of some exotic trees is little known in this country, I am collecting specimens for experiment. I shall, therefore, be much obliged to any of your readers who would be so good as to inform me of anything uncommon which they may come across, and shall be willing to pay the full value for short logs or planks of such trees as I want. Samples of them will be sent by me to the timber museum at the Royal Gardens, Kew, or to the Forestry Collection of the Surveyors' Institution if desired. Any particulars or measurements of unusually large or rare trees in Great Britain or Ireland will be gratefully acknowledged."

## Appointments.

Mr. D. Bliss, head gardener at Roundhay Park, Leeds, as superintendent of the parks and open spaces at Swansea. \* \* Mr. W. Earp succeeds Mr. Geo. Sage as head gardener to the Marquis of Camden, at Bayham Abbey, Lamberhurst. Mr. Earp's successor is Mr. W. A. Cook (late of Compton Bassett), who thus goes to Shirley House, Shirley, near Croydon, the residence of Col. Simpson. \* \* John MacLellan, for the past thirteen years at Weston Manor, Otley, Yorks., to J. E. Riley, Esq., Arden Hall, Accrington, Lancashire. \* \* W. J. King, fruit grower at South Lodge, Horsham, Sussex, and formerly general foreman at Warren House, Stanmore, Middlesex, as head gardener to Lord Dunleath, Ballywalter Park, Co. Down. \* \* Mr. Henry Durnford, late gardener at Stanmore Hall, to be head gardener to R. M. Caulfield, Esq., Broadhanger, Petersfield. \* \* Mr. F. Tapper, gardener to Sir Samuel Scott, Sundridge Park, has removed to Westbury Manor, Brackley, Northampton, still with Sir Samuel Scott.

## Horticulture and Character.

In a recent talk before the Michigan State Horticultural Society, N.A., Hon. Charles W. Garfield entered a plea for the subordination of commercialism in horticulture. He believed that the tendency to measure everything by the dollar or by the margin of gain was not calculated to raise the ideals of life. We make the following extracts from Mr. Garfield's address: "In reviewing the history of horticulture in our country we find that the men whose names are most highly respected as leaders in the movement are those who paid the least attention to the question of whether this fruit, or this movement, or this tendency, would bring more dollars into the pocket than another. The main thought has always been with these leaders, 'Will our art, developed in this way, reach a higher standard of influence for the betterment of mankind?' Note the names of the men who have built upon this foundation: Marshall P. Wilder, the family of Mannings, the two Downings, Warder, Thomas, Lyon, Hexamer, and the two Saunders of Washington and Ottawa, Furnas, Babcock, Tracy, Burbank. I could name many others, like Barry, Ellwanger, and Meehan, who have achieved commercial success, but their names are written with these others because of their influence in the realm which stands above commercialism."

## The Largest Tree in Switzerland.

The largest tree in Switzerland is to be found in the Melchthal, perched on the mountain side, at a height of 450ft. At the base it measures in circumference 40ft. The circumference of its trunk six feet from the ground is 26ft, and one of its branches is 4ft in thickness. The diameter at the top is 84ft. This mighty giant of the forest shows great signs of age, but is in a perfectly healthy condition.

## Weather Notes from Hamilton, N.B.

The somewhat terrific gales which visited the British Isles a week ago appear to have been the climax of the year's meteorology. Here, at all events, the weather has taken a decided turn for the better. We have, at present, the very best conditions that could be desired, plenty of sunshine and pleasing breezes. Frosty mornings, however, succeed the bright sunshine. We have had it hard enough to kill many flowers and vegetables. Nevertheless, we are glad to refrain from grumbling, in case we shall be again visited with the vengeance of the rain and storm fiends.—D. C.

## August Weather at Belvoir Castle.

The prevailing direction of the wind was S.W., total thirteen days. The total rainfall was 5.09 in, this fell on seventeen days, and is 2.43in above the average for the month; the greatest daily fall was 2.10in on the 24th. Barometer (corrected and reduced): highest reading, 30.186in on the 6th at 9 a.m.; lowest reading, 29.077in on the 15th, at 9 a.m. Thermometers: Highest in the shade 75deg on the 8th, lowest 42deg on the 22nd; mean of daily maxima 65.32deg, mean of daily minima 50.38deg; mean temperature of the month 57.85deg; lowest on the grass 37deg on the 22nd, highest in the sun 128deg on the 6th; mean temperature of the earth at 3ft, 57.25deg. Total sunshine, 145 hours 30min, which is 20 hours 12min below the average for the month; there was one sunless day. The above mean temperatures are all much below the average for August, but are not so low as in August, 1902.—W. H. DIVERS.

## Frames and Glass Copings.

The illustration, on another page, of frames and wall-tree shelters, shows some of the types made by Mackenzie and Moncur, the hothouse builders of Edinburgh, to whom we are indebted for the use of the block. Good frames are always serviceable, and never more than during winter and spring, when much of the bedding material is tided-over in them; and Lettuces and Violets, too, are grown in quantities in frames and pits. The chief points are that they should be drip-proof and have certain conveniences for ventilation if they are span-roofed. The wall Peach-case and the glass coping are well worth all the trouble and outlay they may cost, for often the lack of them (as in a season like the present) means the entire loss of a crop, and with it a year's labour. Is it not, therefore, advisable to protect the finer fruits—the Pears, Gages, Apricots, Cherries, Peaches and Nectarines? Even Grapes (Royal Muscadine and others) could be made successful with only a little protection, and it is well to consider what may be done in one's own individual case.

## Preservation of Old Trees.

The subjoined hints have been contributed to the "Hereford Times":—When an old tree is seen to be losing vigour, and there is no apparent cause, it may be presumed that the soil has become exhausted and is unable to sustain the tree in vigour. The soil ought then to be removed from the roots for a radius of 15 or 20 feet from the stem, great care being taken not to cut or damage the roots; the soil removed to be replaced with fresh soil—old turf if it can be had and well rotted farmyard manure, mounded up round the stem a foot or more, and well watered. I have seen the above treatment tried with good results in every case. Old trees which are hollow (if it be possible to get inside them) should have all the decayed wood scraped off the inside of the stem, and painted over with green tar and pitch, which acts as an antiseptic and helps to stop decay. The dead and dying branches ought to be removed close to the stem with a saw, and painted. Every hole in the tree that would admit of water lodging should be filled with pitch. Where the tree is forked and there is danger of the one part breaking away from the other, all the superfluous branches should be removed in order to lighten that part and lessen the tendency of splitting. The judicious use of iron bands and bolts is of great help in keeping some old trees together.

**National Chrysanthemum Society, September 21st.**

The Floral Committee of the Society met for the first time in the present year at the Essex Hall, Essex Street, Strand. Mr. D. B. Crane was elected chairman for the year ensuing. Two flowers only were submitted for awards, viz., Japanese, J. A. Humphrey, pale yellow; in the younger flowers there is thrown over the florets a tint of delicate pinkish salmon, which

first prize to Mr. Swanwick on the ground that he had got together a more varied collection. W. Wells and Co., of Earlswood, Surrey, sent several varieties of new Chrysanthemums. Mr. Charles Hibbert, of Sherwood Rise, also lent an imposing group of plants, effectively arranged by his gardener, Mr. J. W. Newton.

In the arrangement of the show, the committee, with Mr. C. J. Mee as chairman, and Mr. F. Husbands vice-chairman, had displayed commendable taste, and the secretarial duties were courteously discharged by Mr. G. E. Skelhorn. Upwards of 100 entries were received, and the following gentlemen acted as judges: Mr. W. Wells, Earlswood; Mr. H. Weeks, gardener to Lady Byron, of Thrumpton Hall; and Mr. Goodacre, jun., Elvaston. The opening ceremony was performed by the president (Ald. C. Bennett). The chairman said that the artisan gardeners in Nottingham would bear favourable comparison with those in any other part of the kingdom, and the show was a striking testimony to the excellence of their work. Ald. Bennett remarked that, having regard to the season, the

*MacKenzie & McNeur*

**Frames and Wall-tree Shelters. (See page 308.)**

is not so apparent in the older ones; it is a deep, full flower, with long, broad florets, recurving at the base, and curling at the points (commended); and Holme Sumner, a bright, deep yellow incurved Jap, the basal florets curling at the points, fine in colour, but rough as shown.

**Nottingham and Notts Chrysanthemum Society.**

The annual exhibition of summer flowering Chrysanthemums, fruit, and vegetables, under the auspices of the Nottingham and Notts Chrysanthemum Society, was held at the Arboretum rooms. The winning collection of Chrysanthemums was boldly and effectively staged, and comprised fine specimens of all the leading varieties. In point of merit the second group was not far behind, but it lacked something in arrangement. Some difference of opinion was aroused in respect of the collections of outdoor cut flowers of any variety, for while the winning group was, perhaps, more representative, Mr. Wright's exhibit was of obviously superior quality. No special conditions had been imposed in the schedule, however, and the judge awarded the

quality of the exhibits was extremely good, and reflected very great credit both upon the exhibitors and the committee who had organised the show, and he sincerely wished them every success. Mr. W. Wells said that he had never seen anything to equal the summer flowering Chrysanthemums grown in Nottingham, and he rejoiced to know that the artisan gardeners received such help and stimulus from the Corporation.

**THE GLADIOLI AT CORNELL.**—Recent visitors to Cornell University, U.S.A., have been charmed by the display of Gladioli in the horticultural trial grounds. There are some 6,000 bulbs in the collection. It has long been the policy of the horticultural department to select different flowers and make a systematic study of the various species. During the past nine years Cannas, Dahlias, Sweet Peas, Geraniums, and Asters have in turn received careful attention. This season the Gladiolus was selected for study, and bulbs were sent in by all the leading hybridisers.

## Methods of Floral Decoration.

A progressive movement in the arrangement of floral effects has been manifest to all observing admirers of the blending of colour and the graceful clustering of Nature's most beautiful gifts.

Pear, Nouvelle Fulvie. (See page 205.)

J. R. Pearson & Sons.

The incongruous massing of flowers regardless of harmony of colour, ignoring surroundings where it is desirous to produce an artistic effect, is frequently the cause of failure and disappointing results. Church weddings of the present day are certainly an improvement on the decorations of long ago, which is no reflection on the ability and refined taste of the operator of the past. Lacking the material from which to select for pleasing and beautiful effects, set designs of decapitated flowers entered largely into the arrangements. Specimens of the graceful and stately *Kentia*, with its dark, rich foliage, contrasting in colour and characteristic habit with *Areca lutescens*, the expansive foliage of *Latania borbonica* and other natives of the tropics could not then be obtained in stately specimens, as to-day. One of the most important factors in church wedding embellishment is the proper grouping of the magnificent Palms, elevated to the proper height, not in a conglomerated mass, but grouped to show individuality and graceful habit.

In the floral arrangements, cut flowers with long stems are now, and should be, used wherever most effective; the sacred altar and chancel decorated with a tasteful profusion of white flowers and *Asparagus plumosus*; columns or arches garlanded with the same attractive green, or perhaps, which is more pleasing in a large hall or church, the glossy foliage of southern *Smilax*, introduced in the north a few years ago and now almost indispensable to the floral decorator. The *Lycopodium* or Christmas green roping which was considered very essential in days of yore is now almost obsolete, except for the Christmas festivities. The decoration of the home for the wedding festivities has been somewhat revolutionised. We seldom behold flowers contorted in such emblems as Cupid's darts, bows and arrows, or balls of flowers massed in solids and suspended in some prominent place in the drawing rooms. The ancient wedding bell appears to be the only reminiscence of "Ye olden time," and its apparent fascinating influence on women justifies the belief that the old emblem may continue to ring joyfully for many moons to come.

In the modern treatment of the house the same conditions may be adhered to as in the church or hall, the grouping of the plants, artistically arranged in the parlours in a selected corner, forming a bower, giving sufficient space for the performance of the wedding ceremony and for the bridal party to receive their congratulations. The wire frame in the shape of a canopy, covered

with green and wired flowers, has lost its popularity, and is now supplanted by the dignified Palm. The banked mantels of growing *Adiantum* interspersed with long stemmed Roses of one colour, arranged in a loose and natural habit, is much more attractive than the ancient formal stereotyped arrangement, where so much wood and wire entered into the construction. Garlands of

*Asparagus plumosus* or *Smilax* entwined on mirrors, and also effective Orchids with stems in water contained in small glass tubes, to prevent wilting; vases of long-stemmed cut flowers of distinct colour, harmonising with decorations of the different rooms to be treated, are preferable and more artistic than the former everyday basket arrangement, even if the durability of the flowers were the only consideration. It is gratifying to observe there is less ribbon used in conjunction with floral decorations than formerly. While ribbon embellishment is not objectionable sometimes, on floral designs, it is somewhat out of character garlanded with flowers and *Smilax* in the drawing-room decorations.

The construction or arrangement of the bridal bouquets of previous years was formal and compact. I will not reflect so far to the past as to refer to the *Camellia* and *Tuberose* bouquets of thirty-five

years ago, with a border of Bristol board paper surmounted by an edging of silk fringe, but contrast the progress in floriculture of later years. The introduction and growing of improved varieties of Roses, Orchids and novelties of every family all assist the artist in forming the beautiful and graceful bouquets of the times.

The treatment of the residence for receptions or dinner entertainments is somewhat similar to decorations for the wedding celebration. Illustrating the decoration for a modern festivity we cannot do better than describe in detail one of the many which came under our own consideration. Groups of Palms arranged for best effect, were relieved by cut branches of *Forsythia Fortunei*, *Spiraea prunifolia* and *Pyrus japonica*, forced for the occasion, and loosely arranged in concealed vases of water. Mantels and mirrors were banked and treated with the same flowering shrubs, all producing a very pleasing effect. Stairways profusely garlanded with *Asparagus plumosus* and *Forsythia* led to the main floor, where the dining room, library, parlours and conservatory were thrown into one great dining-room. The tables, which seated 300 guests, were constructed to order, the centre portion built separately, six inches below the outer sides for the placing of growing Orchids in pots. With tubs concealed under the tables, the trunks coming through 12ft apart, specimens of *Dicksonia antarctica* 8ft in height were utilised, their tropical and graceful fronds producing an admirable and tasteful decoration. Hidden and suspended in the fronds by flexible wires were many glass tubes of water, each containing sprays of *Cattleyas*. Growing Orchids embellished the mantels; festoons of *Asparagus plumosus*, interspersed with *Cattleyas*, beautified the mirrors; and the conservatory in the background had brilliant colours of potted *Azaleas*, sheltered as it were, by the overhanging branches of tropical foliage, completed one of the most original and elaborate decorations of the season.

Now as to the accomplishment of success in these "modern methods." It must be remembered that these results can be attained, so far as artistic effects and charming designs are concerned, without any expensive and elaborate process and with even limited means at one's disposal. If one has the love of flowers and the soul of the artist within him, as every florist worthy of the name should have, the "modern methods" become a delight. It would be an interesting study to consider how, under efficient supervision, the modern methods will be utilised in working out the perfected accomplishments in decorative floral and horticultural achievements, that will make our country in this respect, the admiration of others!

\* Paper prepared for the Milwaukee Convention by Alexander McConnell, New York.

## Melons at Longleat.

It is many years since Mr. W. Taylor instituted the system of growing Melons in the Longleat Gardens on what is commonly understood as the extension system of training, and I cannot myself recall another instance where the same success attends the practice. Successive gardeners who have in turn held the important charge during all those years have conformed to the adoption of this principle, because by it fine fruits, unfailing succession, and high quality are thereby obtained.

Probably each in turn, prior to their coming to Longleat, found the orthodox methods to suit requirements, for it is well known that few adopt the extension as compared with that of restrictive methods of growth and fruit. Generally speaking, from three to six fruits are considered ample for a Melon plant to carry to perfection, and more often than otherwise the maturity of these exhausts the plants that bear them. This is not so, however, with plants allowed a freer head and root provision, for eighteen or more fruits have been counted, all in differing stages of development, on one plant, and how many more than this number it is possible to obtain is beyond my knowledge. This number I have actually counted myself, and am therefore witness to the truth of the fact.

Formerly but two varieties were cultivated at Longleat, the old, but now seldom heard of, Cashmere, and Eastnor Castle. The first-named was of such vigorous habit, and under leaf restriction such a signal failure, that the extension system of training was probably adopted as an essential necessity to avert that disappointment which past efforts had given in this particular kind. Since that time it has been amply demonstrated at Longleat and elsewhere how suited is this principle of training for other kinds.

The late Mr. Pratt, by the inter-crossing of Eastnor Castle with Meredith's Cashmere, produced a fine Melon, afterwards named Longleat Perfection. It had but a short career, however, probably because this also demanded a greater freedom of lateral than many were disposed to give. Neither kind has much patronage now, being superseded by such an ever-changing introduction of certificated novelties.

High quality provided in those old-time Melons had a fame which time only has made less appreciated. The common cry of to-day is that Melons possess such an indifferent and uncertain quality. In those days at Longleat, when fruits were taken from healthy and vigorous plants, this flavour question never had a test, nor was raised by comparison. The same rule holds good now, though modern kinds find favour to a much greater degree than at that time. Mr. Gandy, the present head gardener, provides fruits in numbers and quality that still possess that uniformity of quality and appearance, so much prized on the table of his noble employers.

This, it must be admitted, does not necessarily arise from the severe limitation to one or two kinds. This practice has been tried and found wanting; for while one variety is early or quick in bringing the first fruits to maturity, others demand more time. This Mr. Gandy has overcome by adopting experimentally a change of stock. Gunton Scarlet has for some time been a favoured variety, and right well has it deserved the precedence given it as regards appearance and quality; but a restriction to one kind provides an after thought, inasmuch as neither the first fruit, nor the constant supply, is rendered so conspicuous a desideratum as demand and necessity require. Every Melon grower realises that one kind will under precisely the same treatment mature at least a portion

of its crop some days in advance of another, and the value of such progress can only find its true appreciation when the yearning for summer fruits has to be appeased, or there is a competitive race with one's neighbour.

Sutton's Triumph and Veitch's Late Perfection are kinds that it is hoped may help to provide a continuity of succession rather than a number of fruits that must of course be stored for indefinite periods in the fruit room awaiting use. Anything tending to "ease up" the weekly supply is deserving of more than passing thought and provision, and this question appears to be one that has engaged, and still does engage, the mind of the respected garden chief at Longleat.

The soil here would appear to be eminently suited to the requirements of the Melon, as also are the structures in which they are grown. Fertilising of the blossoms, though it is scarcely necessary, is attended to in their season as a safeguard against failure; but when other conditions favour, no anxiety need be felt for the assurance of a successive advance of the embryo fruits, as the lateral-bearing growth produce them. It is not usual for Melons to set their fruits unaided, but their cultural treatment at Longleat would seem all-sufficient.

Loose brick walls are made to enclose the soil for each separate plant, and not more than three are ever planted for the main crop in summer. As they advance in leaf and root extension soil can be easily given by taking down the bricks and setting them out a distance of, say, 6in to 8in wider all round, to be filled in with new loamy compost. Beyond line, nothing of a stimulating nature is requisite in the soil, and the vigour of the plants, the size and number of advancing fruits, speak in eloquent language, favouring cultural detail and surroundings.

I am told that one plant can easily be made to fill a compartment measuring quite 30ft in length, the growth issuing from the main leader radiating laterally along the roof wires, and these in turn furnishing the successive fruiting growths. It need not be repeated that only close application to their daily needs, and the periodic linings of new soil, are items that must not be neglected to ensure the high state prevailing.—W. S.

### Apple, Golden Pippin.

Dr. R. Hogg has quite a treatise on the head of the Golden Pippin ("Fruit Manual," 5th Edition, p. 91); but we are only con-

Apple, Golden Pippin.

cerned with a few facts about the variety. It is a very old one, being the "small Golden Pippin" referred to by Parkinson, and is an esteemed dessert Apple, though excluded from a number of nurserymen's lists. The fruit is small, about 2in wide and the same in height, of a rich golden yellow. The flesh is crisp, juicy, and sweet, and the fruit is in season from November till April.

## Fruit Show and Vegetable Conference at Chiswick.

The late editor of this journal, Robert Hogg, LL.D., in the introduction to his book on the Apple, wrote that fruit culture was almost an entirely neglected study till about the fifties of last century. Owing to his own great efforts, and to those of Francis Rivers, J. R. Pearson, and Mr. Blackmore in our own country, and equally ardent men on the Continent, fruit culture, and the study of varieties, has been almost raised to the level of an exact science.

But much of the ladder has to be climbed yet, and past achievements are but the stepping stones for what lies before us. And while fruit is justly attracting the brain and skill of the best men in horticulture, that other great department of gardening which is embraced in the raising and production of the finest culinary vegetables, is as yet only in the awakening stage. The Royal Horticultural Society is therefore acting up to its opportunities in having the present conference on vegetables and exhibition of kitchen produce. The success attending the meeting is recorded in our report; and we hope that these labours may become an annual necessity, that the present may be the first of a long series of annual joint fruit and vegetable exhibitions. But one chief thing is necessary if this is to be so, and that is—MONEY.

The Council, in a preface to the schedule, say that they "have consented to this exhibition on condition that those interested in the promotion of British fruit and vegetable growing would combine to subscribe a sum of not less than £200 towards the prize money and general expenses, which are estimated at a cost of £350 or £400." Not a very large sum seems to have been subscribed, if we judge from the list of donations given. Messrs. Sutton and Sons show an excellent example by contributing £25; Messrs. Bunyard and Co., Ltd., give 10 guineas; W. Horne and Sons, £10; J. R. Pearson and Sons, prizes and £1 10s.; C. Sharpe and Co., Ltd., £10; J. Veitch and Sons, Ltd., £10; and these are the chief presentations.

Chiswick, the scene of so many great horticultural meetings, is a splendid centre, accessible from all parts of London, and the Council had printed full directions for visitors to get there. This, probably, is the last of the long series of Chiswick shows, and, if so, it closes a passage of splendid, if troubled, history.

In order to include as many vegetable classes as possible, those hitherto devoted to single varieties of fruit had been somewhat curtailed. Every available place in the Chiswick Gardens, even to the entrance porch, which greeted one with a display of Onions and other vegetables, was utilised on this occasion, and the great vinery furnished a magnificent display. A luncheon was given by the Council at one o'clock when Mr. T. Humphreys was presented with testimonials on his retirement from the assistant-superintendentship of the gardens here. The Gardeners' Dinner at Holborn Restaurant, in the evening, was attended by 400 men from all parts of the country, and Lord Duncannon occupied the chair, owing to the illness of Mr. Leopold de Rothschild, who had been expected.

### THE CHISWICK LUNCHEON.

A very large number of gentlemen dined at the invitation of the Council. Sir Trevor Lawrence, Bart., in the chair, who was supported by Sir Thos. Hanbury, Dr. Cooke, N. C. Cookson, Geo. Bunyard, Prof. Henslow, W. Bateson, Owen Thomas, R. Dean, F. W. Burbidge, D. P. Laird, H. B. May, and others.

After the loyal toast, Sir Trevor, amid prolonged and loud acclamations, announced the award of the vacant Victoria Medal of Honour to Sir Thomas Hanbury, the donor of the Oakwood garden to the Royal Horticultural Society. Sir Thomas replied in a few well-chosen words. He asserted that what he had done was to save a unique and beautiful garden.

The chairman then gave the toast of "The Committees," and mentioned that very shortly the gardens would be vacated, and continued his address to briefly dwell on a few chief events of the Society's history, which are more or less known to Journal readers. Sir Trevor stated that he had attended Chiswick shows for sixty years, and in his peroration, gave a touching farewell to old Chiswick. In proposing the toast to the Committee he coupled the names of Mr. Bateson, E. Molyneux, and W. Crump.

Mr. Bateson, in his reply, asked whether some new and great beneficial departure could not be made when the new Wisley garden is taken over. The horticultural industry, he said, was unique among the arts, in that science was not coupled with practice, not to the same degree as in the brewing and iron industries. May the taking on of Wisley not be used for the determination of the hybridisation experiments that are now so paramount? This would be a work worthy of the Society, and earn the gratitude of naturalists throughout the whole

world. Mr. W. Crump and Mr. Molyneux also spoke. The latter said, in regard to the vegetable exhibition, "that a better display of these had never been seen in creation," which evoked laughter, even though it was unchallenged.

### PRESENTATION TO MR. T. HUMPHREYS.

Then came a very pleasant duty, the handing to Mr. Humphreys of a beautifully illuminated address, which was read by Richard Dean, and offered by Wm. Marshall. The horticultural Press also presented a testimonial through Mr. Gordon. The text of both addresses is here given:

#### From the R.H.S. Committees.

"This address, together with a cabinet canteen of cutlery and silver and a Queen Anne tea and coffee service, is presented to Mr. T. Humphreys, secretary of the Floral Committee of the R.H.S., by those whose names are appended, in warm appreciation of his services to the Floral and Fruit Committees of the Society, both at the Drill Hall, Westminster, and at the gardens of the Society at Chiswick. They desire to congratulate Mr. Humphreys on his appointment as Curator of the Botanical Gardens, Edgbaston, Birmingham, and cordially wish him and his family good health and increasing prosperity."

The address was signed by seventy-three subscribers. It was beautifully prepared, with symbolical emblems of the various Committees, crowned with a growing tree, to represent the Society.

#### From the Press.

"On your retirement from the Royal Horticultural Society's historical garden at Chiswick, the undermentioned representatives of the horticultural Press desire to offer you an expression of their good wishes. They acknowledge with appreciation and thanks the courtesy and assistance you have freely afforded them at the Society's exhibitions, and on other occasions; and they beg you will accept the accompanying roller-top writing desk, with their autographs engraved upon a plate, as a token of their wishes for the future health, happiness, and prosperity of yourself and family. They hope that the work you will do in the Edgbaston Botanical Gardens at Birmingham will succeed in further popularising the art of gardening and encouraging a greater love for plant life. Signed, E. T. Cook, H. G. Cove, C. H. Curtis, J. Harrison Dick, John Fraser, A. S. Galt, Geo. Gordon, Maxwell T. Masters, F.R.S., F. Moore, R. Hooper Pearson, W. P. Thomson, H. H. Thomas, H. J. Wright, and W. P. Wright."

Mr. Humphreys expressed his heartfelt thanks for the kindnesses he had received, and referred to the amiable relations that had always existed between himself, the Council, the Committees, and all with whom he had business, and he took comfort in knowing that so many eminent horticulturists had wished him God-speed in his new sphere.

### THE CONFERENCE.

Hardly had Mr. Bunyard opened the Conference on Vegetables than the rain poured, and continued more or less all the evening. Three papers were read, and these we briefly summarise.

#### "SUPPLY OF VEGETABLES FOR A PRIVATE FAMILY."

BY MR. W. H. DIVERS.

Mr. Divers described the houses, pits, and frames he uses and recommends for vegetable culture. A store-room is also a necessity, and for all crops this should be cool, but not quite dry, except for Potatoes, whose delight is a cool, dry atmosphere in the store-room.

Describing the kitchen garden, he said that a deep soil was very necessary, and his experience on sandy, loamy, limey, and other varieties led him to prefer the Northampton red sandstone soil. This he had worked 3ft deep, as soils, wherever possible, should be. Turnips, however, never succeeded on this kind of soil, which was good for all other vegetables. He was hardly able to employ superphosphate on this formation. With reference to heavy clays, he thought an ordinary lifetime scarcely long enough for a man to make them good-workable tilths.

A kitchen garden sloping to the north is often badly suited for crops. The culinary area is generally walled in, the walls being 10ft to 12ft, and choice fruits are grown thereon. Hedges of Holly or Yew were objectionable, as was the near presence of large trees, because of the ingress of their roots, robbing the garden soil. The size of a kitchen garden depends on the

number of persons to be served, an acre being equal to the needs of ten people. Belvoir Castle, the gardens of which Mr. Divers has long presided over, contains seven acres within the walls, and seven and a quarter acres outside, with four acres of orchards in addition. The proportion of the above total of fourteen and a quarter acres of cultivated ground used for vegetables is two and three-quarter acres; two and a quarter acres are used for fruits of various kinds; and the remaining nine and a quarter acres are occupied by vineries, plant houses, frames, bedding-plant-ground, paths, hedges, &c.

Of vegetables, the following proportions are grown, taking the unit as 37 square yards: Asparagus stands at 32 square yards; Artichokes, 8; Beans of various kinds, 15; Brussels Sprouts, 14; Broccoli and Cauliflowers, 14; Cabbages, 17; Carrots, 14; Parsnips, 3; Beet, 4; Celery, 27; Horseradish, 8; Leeks, 3; Kale, 4; Peas, 36; Potatoes (early), 15; Potatoes (midseason), 50; Seakale, 14; Spinach, 9; Onions, 19; Savoys, 20; Turnips for autumn and spring, 9; and the remainder is occupied by Shallots, Garlic, Salsify, pot herbs, &c. Turnips are grown between rows of Peas; Lettuces are grown between Celery; summer Spinach between Peas; and a few other things in a similar manner.

In rotation of crops it is not always possible to follow a strict rule; but the lecturer gave a few broad principles in this matter. Leguminous crops are followed by "green" crops, such as Brussels Sprouts, which require more soda, lime, and sulphates than Peas and Beans. As Potatoes demand much potash, a suitable vegetable, not requiring this, must follow them, as Onions.

The well-known, but oft-to-be-repeated rules with regard to sowing and thinning, were touched upon. Mr. Divers advised the sowing only of the finest seeds, from reputable seedsmen; as bad seeds yield plants that fall prey to all the diseases the genus is heir to. Thin seedlings early. He had known a brake of Carrots ruined through having been left a fortnight over time. Then, size in vegetables was not the chief point to be considered. He placed quality first, and second, a continuity of supply. Show vegetables, he thought, are not appreciated by the consumer. Nor was heavy manuring desirable; it perverted the highest quality. Brussels Sprouts and the whole Brassica tribe could be greatly assisted by 3oz per square yard of superphosphate, and 1oz of nitrate of soda, supplied at a good growing period, and other chemicals used in conjunction with dung were to be commended.

In conclusion, Mr. Divers had something to say on varieties. Rely on thoroughly tested kinds, was his advice, especially where a large supply has to be maintained. The seedsmen were blamed for offering too many varieties, and it had become a practice for every seedsman to prefix his or his firm's name and title. It was annoying, to say the least, to find old varieties sent out under new names. This he appealed against. The chapter on varieties was not read.

#### MR. BECKETT ON EXHIBITION VEGETABLES.

The redoubtable Aldenham grower, who is an all-round gardener of mark, read his paper in double-quick time, yet so clearly that his audience heard and followed all he said. He naturally supported the exhibition aspect of vegetable culture, and went on to show that size is not the alpha and omega of an exhibitor. Beet is coarse, and no good if very large; yet Celery could be juicy, succulent, and sweet even when at its largest: it cannot be too large. Leeks, he said, should at least have 12in of blanched stem, and be 6in in circumference, without any bulb—even throughout. The Leek demands great care in culture, and therefore should point high on the boards. The highest culture is absolutely necessary also for Mushrooms; but Cucumbers are often shown much too large.

The character of the ground to be dealt with should be clearly understood; and no piece of ground should be cropped for two years in succession with the same subject, Onions being an exception. These may be grown on prepared beds year after year. The time to trench has been, and is, a matter of controversy. Mr. Beckett seconds David Thomson's experience, as announced through the *Journal of Horticulture* some years ago, which is, to leave the trenching of heavy soils till the spring, and light soils can be forked over in the winter. The objection is made that time cannot be afforded in spring, but the best and ablest gardeners can always manage their assistance to the best advantage, leaving time for all duties, as they come.

Mr. Beckett explained the various trenching operations, with the proper placement of manure: green, long manure at the bottom, and he always brings the lower spit of soil to the top; no bastard trenching. The ground should be broken up 2ft to 3ft. Previously to planting, the surface should be forked over, and top-dressings may be worked in. In cropping, he makes Beet and Salsify to follow Celery, incorporating a liberal supply of soot, road scrapings, and old mortar rubble (not too coarse), and even after Celery he trenches the ground. Wherever time and labour allow it, he advises the annual trenching of the kitchen garden.

The exhibiting of vegetables was broached, and the renowned prizetaker furnished succinct hints. Some time before the date

of an exhibition the enthusiast will be noting the different specimens likely to be his best, and will mark them with a stick. This saves much time at a later date, and everything can be done to encourage the elect of the crop. Cauliflowers, Cabbages, and Lettuces, if too forward, can be pulled, and hung by the roots in a cool, dark cellar. Cauliflowers should be covered with fresh leaves to preserve the purity and protect them. Slugs should be rigidly hunted for, as damage is speedily done. Parsnips should be left in the ground till the day before the show, as they speedily lose their fresh gloss. The points of Potatoes were discussed, evenness and smoothness being great factors. Large Beans and Peas should be regarded with favour.

A medium-sized oblong hamper is best for the packing. Carrots and other roots that have been washed should be carefully laid on clean, damp mats, and the best packing material is fine wood wool. All items should duly be noted, and labels should be distinctly written for them, these being placed together in an envelope, ready to be attached at the proper time. Plenty of well-washed Parsley should be packed in for garnishing, as this is always useful.

Three hours should be allowed, if the exhibit is a large one, to set up the collection. The essayist went on to describe the place best suited for the different sorts. A central triangle should be made of Cauliflowers, which ought to be included in

Apple, White Transparent.

An Apple in use during July and August, is a good bearer, of general excellence, and very fine in appearance. It is recommended for market, being useful either for eating or cooking. It is comparatively new,

every collection. As each subject of the display is placed in position, it should be covered with tissue paper before going on to set up the next thing. When the collection has been placed in position, the conditions of the schedule must be carefully checked, in order to make certain that everything is complied with. Schedules, said Mr. Beckett, ought distinctly to specify the number of each vegetable desired. This saves confusion and uncertainty. Potatoes, Carrots, Onions, and Tomatoes should be always included in collections if possible, and Peas, Beans, &c., if in season.

#### MR. LOBJOIT ON THE "MARKETING OF VEGETABLES."

London, in area and population, has outgrown the old means of supply that were adequate when the Georges reigned. There is now scarcely a market garden within ten miles of the City, and they will soon be twenty miles. London is looked on as the industrial centre by producers so far east as Japan, and so far west as San Francisco, and they come in increasing numbers from the Antipodes.

There is reason for complaint in the means of disposal. With one great central market, the suburban greengrocer has to drive

his van in to take back the produce that a few hours previously had passed his own door. This compels him to be up in the small hours of the morning, working in darkness or dim light, and ere the vegetables are disposed of to consumers in the outskirts they are both deteriorated through much handling back and forward, and dear in price. The question is often asked, "Why are vegetables so dear?" One cause is the want of means of adequately gauging the market. It is a fact, too, that the scavenger often carts off many surplus vegetables that have had to be pitched upon the streets, just as loads of flowers are destroyed in the same manner.

The costermonger does a good service by taking quantities of vegetables into densely populated quarters. The system of delivery direct to the retail dealer is slowly being developed. Often, as things are at present, the stock offered by the suburban greengrocer is a libel on the succulent, fresh vegetables that one may find leaving the market gardens. Then, again, local markets must do something to remedy existing evils, and Mr. Lobjoit referred to the local market at Brentford, Middlesex, which allows salesmen in the neighbourhood to attend market oftener than they had done, and so maintain constant supplies of fresh material. "What," asked the lecturer, "is the use of growing vegetables if your market fails you when you have grown them?"

Expenses are now higher, and means of culture are different to what was pursued twenty or more years ago. In Fulham and elsewhere sixpence a rod used to be paid for bastard trenching, and, while Radishes and Turnips used to be sown in drills by hand, they are now sown broadcast. Peas were trained to stakes twenty years ago; now they are never supported; but, of course, all this is to be allowed if good produce can be grown at a cheaper rate.

But the chief bane, or one of the leading points of grievance with the market gardeners is that there is so much knocking about of produce. First the Cauliflowers, say, from the fields go to the carts, then in the markets they are thrown into a heap; back they go into buyers' baskets, and having arrived at the shops, they are thrown out upon benches.

Nothing seems yet to be devised for lessening the large expenditure of getting Radishes to market, taking them but as one instance. The binding of the bunches costs twopence a dozen, and tying another penny, and the marketmen only obtain fivepence a dozen bunches. If a machine could be patented to grade, bind, and assort these and other things a great gain would be effected.

There are two schools of market gardeners—one that grows produce that can bear carriage from a distance, the other where weight of produce necessitates nearness to market, even if the land rent is there; thus the couplet "Land dearer: But market nearer." Rhubarb is never far from market. Certain localities, of course, are greatly famed for certain vegetables, the district being specially suited for them; and Mr. Lobjoit said that the tendency is for the greater centralisation of crops.

As in the case of Mr. Divers' essay, the one we summarise dealt hardly with the iniquities (!) of the seedsmen, the complaint, which was gilded by humorous allusions, being laid against the catalogues with the novelties, all distinct and guaranteed, like the wine lists of hotels. Looking into one catalogue (one taken at random), the lecturer found 116 different Peas, 29 varieties of Beans, and 16 Lettuces.

In continuing, Mr. Lobjoit wanted to know why there was such an inordinate rage for size. Short, crisp, nutty Celery was surely preferable to huge sticks; yet "Best" is market terminology always means largest. The rage for size is most remarkable in Cos Lettuces. If a Cos Lettuce is not large it is not wanted. A dozen of "large" bring 1s. 8d.; of "small," 6d. for 22! Yet, who ever saw a Lettuce sent to table whole? The speculation of late years in Aubergines and other less grown vegetables has been "a bit of a gamble," owing to the sombre seasons.

Mushroom growing, the lecturer said, was now reduced to an exact science. At one time it was common to have excellent crops one year, and the grower could not tell how he got them; and the next, though every care had been taken, the crop would fail. The last words were devoted to cynical references to the Board of Agriculture, which could not make up its mind how to class the market gardener and his calling. And, speaking of encouragement to marketmen, Mr. Lobjoit said the outlook was bad when a certain society "which shall be nameless here" (the R.H.S.) omitted even to have one vegetable class set apart for the market gardener and his kin.

Dr. Bonavia and Mr. Hudson were both absent, and their papers were taken as read. A paper by Mr. Baker, of Kew, was sent, entitled "The Productivity of Seeds."

### THE GARDENERS' DINNER.\*

It was said truly that no such dinner as that which we record has been held since 1866. There were fully 400 gardeners and lady friends present, the magnificent King's Hall at the Holborn

\* This dinner was quite a separate event, and not promoted by the R.H.S.; but coming on the first day of the meeting it may be allowed as part of the complete programme under our title.

Restaurant being packed to overflowing. Leopold de Rothschild, Esq., was unfortunately prevented by illness from taking the chair, but the breach was filled by Viscount Duncannon, who most worthily acquitted the duties pertaining thereto.

Having partaken of the very excellent repast, the secretary of the Dinner Committee, Mr. A. Dean, read a number of letters from absent gentlemen. One was from the Very Rev. Dean Hole, who is prostrated by illness in North Wales; but the genial Dean sent a characteristic letter, with "an old man's blessing and love for his brethren," and he quoted the words of Mr. Francis Rivers to himself many years ago: "Your delight in flowers will never leave you."

Leopold de Rothschild, Esq., had written from his sick bed, and his most pleasant communication showed how keen was his sympathy with the gardener and the gardener's calling, and he referred to this meeting, which gave old bothyites the means of meeting after long years of separation. And ere the chairman commenced his address under the toast "The Royal Horticultural Society and all other Horticultural Societies," he read a telegram from Mr. Leopold de Rothschild, who wished to add a greeting, and hoped that a pleasant evening would be spent.

The chairman was in his best form, and for twenty minutes held his hearers' keenest attention. He referred to "the hearty handshake from many an old friend" which the present dinner would bring about. He took his audience later to Ireland, where, though there are many poor cottages and poor people, there are likewise many fine gardens and cottage fronts. Lord Duncannon thought Ireland could develop its fruit culture large and small, and be made profitable. He was strong in the praises of his gardener, and of his own gentle partner in married life, who study the garden they have. And almost in his last words the chairman said, and with all sincerity: "If any of you are near my own garden, give me a call, and I shall be delighted to see you."

In responding, Rev. W. Wilks, M.A., Secretary of the R.H.S., had a stirring appeal to make on behalf of the Hall Fund of the Society. He looked back to 1887, when the R.H.S. had only 770 subscribing Fellows, and a debt of £1,200. Now it has fully 7,000 Fellows, and as many pounds sterling per year of an income, plus £450 as revenue on surplus funds. He asked, "Are there not plenty of wealthy people in this country of ours, who, without an effort, could reduce the paltry debt of the Hall, a matter of £20,000?" Yachting, horse-racing, motor-ing, versus gardening. Which?

After several songs, Sir Trevor Lawrence, Bart., rose and gave "Gardening and Gardeners." He alluded to his own younger days, when flowers on dinner tables were altogether the exception. Now rich and poor alike have them. Those cottage fronts, too, that are bright with flowers, are these not the happy homes of England? "How much we owe to our gardeners, and how great are their responsibilities!" Sir Trevor uttered the words as only a true lover of flowers, gardens, and gardeners could. "The art and craft of gardening is under-

Apple, Lord Hindlip.

This was sent out in 1896. It is a dessert Apple, an excellent bearer, of weeping growth, the fruits of capital flavour, coloured a rich russet red. Its season is from January to May.

stood in England in a way not found elsewhere in Europe," was another sentence from Sir Trevor, and he told a story of a visit to Geneva years ago, where he received a present of fruit, a present such as made the waiters and others stare; and these were grown by an English gardener. To the lady gardeners you will extend the hand of friendship, especially if they will leave alone the "plums."

In conclusion, Sir Trevor said that as votes will be flying about very soon, he hoped the claims of so great and good a gardener as Mr. Chamberlain will be recognised.

Mr. T. Challis and Mr. J. McIndoe responded, the former opening his eloquent and high-levelled speech by saying he felt very much as most gardeners did after that dreadful week in last April when they were left "peachless." Notwithstanding the metaphors, Mr. Challis rendered a splendid address.

The remaining toasts (which, be it noted, we were quite unable to report, owing to the uncomplimentary and incessant din which arose from the unnecessarily long and numerous speeches)—the remaining toasts were devoted to the Horticultural Press, the Gardening Charities, the Horticultural Trade, and the Chairman. The speakers were Messrs. H. J. Veitch, A. W. Sutton, Geo. Bunyard, R. Dean, Geo. Gordon, Owen Thomas, Geo. Dickson, C. H. Curtis, H. B. May, and A. Dean.

The tables were beautifully decorated with flowers by Messrs. Veitch, of Chelsea, and fruit came from Mr. Peter Kay.

## THE SHOW—FRUIT.

### DIVISION I.

Fruit grown under glass or otherwise. Open to gardeners and amateurs only.

Class 1 was for a collection of nine dishes of ripe dessert fruit, six kinds at least. Here there was only one exhibitor in Mr. J. H. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, who was deservedly awarded the first prize. The Grapes were Muscat of Alexandria, Gros Maroc, and Alnwick Seedling, all in first rate form. Pine Cayenne, decidedly small for this variety. The Melons were Thornton Hero and Beatrice Barnes. Peaches were excellent, the varieties being Princess of Wales, Barrington, and Golden Eagle. Nectarines, Albert Victor (grand) and Humboldt. The Apples were good and well coloured. Washington, Ribston Pippin, and King of Pippins were the varieties represented, while a good dish of Pear Doyenné du Comice and Brown Turkey Figs completed the display.

In class 2 there was but a single competitor for the collection of six dishes of dessert fruit. This was staged by Mr. W. Mitchell, gardener to J. Willis Fleming, Esq., Chilworth Manor, Romsey, Hants, and made a first rate display too. The Grapes were Mrs. Prince, in first-rate form, and Muscat of Alexandria. Peaches Sea Eagle and Orange Walburton Admirable, Pitmaston Duchess Pear, and Cox's Pippin Apple.

Class 3 was for a collection of Grapes, six distinct varieties, of three bunches each, both black and white. Again there was only one competitor. Mr. J. H. Goodacre, who made a fine display; but it would have been more effective had each variety been staged together, the only white variety being Muscat of Alexandria. Black Hamburgh, Barbarossa (immense clusters), Black Alicante, Gros Maroc, and Madresfield Court, small bunches of well coloured berries. A really fine exhibit.

The three bunches of Black Hamburgh only brought out six competitors, and nothing sensational in either bunches or berries. The first prize was secured by Mr. W. Mitchell for good bunches with small berries. Mr. J. H. Goodacre followed with better berries, but poorer in colour; while Mr. G. Lane, gardener to Miss A. S. Ridge, Highfield, Englefield Green, brought up the rear. Some of the exhibits in this class were not worthy of a City barrow stall, much less a class at this show.

Mrs. Pince was exhibited by three competitors, the first position being awarded to Mr. W. Mitchell, who had grand bunches of this variety, though rather "underdone," Mr. Jas Day, gardener to the Earl of Galloway, Galloway House, Garliestown, N.B., being second.

There were five contestants for Black Alicante, Mr. H. H. Brown, gardener to G. C. Raphael, Esq., Castle Hill, Englefield Green, being first with nice clusters, though rather deficient in bloom. Mr. M. Brodie, gardener to S. Platt, Esq., Wargrave Hill, Twyford, was a capital second, and Mr. W. Allan, gardener to Col. the Hon. C. Harbord, Gunton Park, Norwich, third.

The class for Madresfield Court was represented by four exhibitors, Mr. W. Mitchell scoring an easy first with three long bunches of excellent colour; while Mr. R. Milner, gardener to Miss Talbot, Margam Park, Port Talbot, made a good second, and the third exhibitor had neglected to place his card on the exhibit.

For three bunches of any other black Grape, no less than six exhibits were staged, the first prize being awarded to Mr. W. Mitchell for a grand exhibit of Gros Maroc. Mr. W. Harrison, gardener to Col. G. B. Archer Houlton, Hallingbury Place, Bishop's Stortford, came next with the same variety. Mr. W. Allan brought up the rear with a similar variety.

Nut, Duke of Edinburgh.

A finely flavoured Nut of medium size; thick shell.

Muscat of Alexandria appeared to be more popular, there being no less than eleven contestants. However, Mr. J. H. Goodacre scored with three well coloured bunches, closely followed by Mr. Jas. Lock, gardener to the Hon. Mr. Justice Swinfen Eady, Weybridge, Surrey, with fine bunches; while Mr. W. Allan was third with smaller bunches of well coloured berries, though somewhat shrivelled.

There were but three exhibitors in the class for three bunches of any Frontignan varieties, Mr. W. Taylor, gardener to C. Bayer, Esq., Tewkesbury Lodge, Forest Hill, being placed first with three nice bunches of Chasselas Napolcon. Mr. Jas. Lock followed with good bunches of Mrs. Pearson, and Mr. Robert Grindrod, gardener to Captain Clive, Whitfield, Hereford, was third with Golden Queen.

### DIVISION II.

The class open to nurserymen and market growers only is one that always excites the keenest interest. On this occasion, however, the produce was in keeping with the season; or, in other words, decidedly below par, at all events as far as size was concerned. Messrs. G. Bunyard and Co., Ltd., Maidstone, were awarded first place, and a first-rate display was made, too, the colour being excellent, though the size was decidedly below what one sees from the Maidstone firm. The best dishes of Apples were Worcester Pearmain, Twenty Ounce, Lane's Prince Albert, Grenadier, Reinette du Canada, Gascoigne's Scarlet Seedling, Cox's Pomona, Gold Medal, Washington, and Allington Pippin. The most noteworthy dishes of Pears were Pitmaston Duchess, Vicar of Winkfield, General Todtleben, Princess, and Durondeau. Plums were sparsely represented, but a good collection of Nuts was displayed, which must have been interesting to the visitors. Messrs. J. Peed and Son, Norwood, were second with a fine exhibit of Apples, arranged in baskets and plates. The fruits were below average size, but wonderfully bright and clean. The best baskets were Peasgood's Nonesuch, Lord Derby, Mrs. Barron, Wealthy, Allington Pippin, Warner's King, and Gascoigne's Scarlet Seedling.

Messrs. H. Cannell and Sons, Swanley, were awarded third for a highly coloured exhibit, which was also well arranged. The best Apples were Bismarek, Lord Derby, Cellini, Peasgood's Nonesuch, Grenadier, Jas. Grieve, Red Quarrenden, Emperor Alexander, and Gascoigne's Scarlet: a really fine exhibit, though the dishes were duplicated right and left, which was difficult to understand. Mr. J. Basham, Bassaleg, Newport, Mon., was an excellent fourth with an exhibit arranged in baskets, which, however, did not lend themselves to the object in view. Messrs. Spooner and Sons, Hounslow, were out in the cold, though why was not apparent.

In class 15, for 16ft run of tabling, Mr. J. B. Caldwell led; Mr. Geo. Mount was second, and Mrs. Pewbitt third.

For 32ft run of 6ft tabling (orchard-house fruit and trees), Messrs. Bunyard and Co., Ltd., were the only exhibitors, their collection being magnificent.

### DIVISION III.

Fruits grown in the open air (except class 30). Gardeners and amateurs only.

The section started at class 17 for twenty-four dishes distinct, sixteen cooking and eight dessert. Mr. W. Wilkins, gardener

to Wm. Bythway, Esq., Narborough, Llanelly, being in the van with most excellent samples, admirably coloured, and they bore evident traces of careful culture. His dishes of Alexander, Newton Wonder, James Grieve, Allington, Tyler's Kernel, and Ribston Pippin were first rate. The second place fell to Mr. C. J. Salter, gardener to Mrs. Haywood, of Woodhatch Lodge, Reigate, with fine dishes of Egremont Russet, Lane's Prince Albert, Stone's, and Cox's. Third came to Mr. Wm. Lewis, gardener to R. H. B. Marsham, Esq., East Sutton Park, Maidstone, with a fine set, the Cox's being perfection.

For eighteen dishes, in twelve cooking and six dessert kinds, Mr. Chas. Crane, gardener to Mrs. Alexander, Chevering Huntton, Maidstone, was first with handsome dishes of Lane's, Peasgood's, Christmas Pearmain, Warner's King, and Newton Wonder. The second place was awarded to Mrs. Thos. Ridgewell, Ossett Grange, Essex, with rather uneven samples in the back row, but altogether they were good; and third out of six entries came to Mr. J. Cornford, Quex Park, Birchington, Thanet, and must have run No. 2 very closely.

First, second, and third, respectively in class 19, for the twelve dishes of Apples, were Mr. A. Porteous, of Belmont, East Barnett; J. W. Barks, Castle Hill, Bletchingley, Surrey; and J. G. Weston, Bessboro', Piltown, Ireland; these alone showing. The fruits were good all through, the Irish fruits being highly coloured.

Class 20, for six dishes of cooking Apples, brought out no less than ten entries, the lead being with Mr. J. Dawes, Ledbury Park, Ledbury, who had Pott's Seedling, Warner's King, Ecklinville, Peasgood's Nonesuch, Tyler's Kernel, and Bismarck, all large fruited. Mr. W. Wilkins, of Llanelly, was a good second with Alexander, Stone's, Mrs. Barron as good samples, there being no third prize.

The six dishes of dessert Apples (class 21) made a fairly bright display. Here again there were ten competitors, and Mr. W. Wilkins was a good first with even, unblemished, moderate-sized examples of Ribston, Allington, Gascoigne's, Cox's, Egremont, and others. Mr. Wm. Lewis, Maidstone, was second, with Worcester Pearmain, Cox's, Wealthy, and Gascoigne's.

Dessert Pears, eighteen dishes. Here were some grand samples in three separate displays. The blue ribbon fell to Mr. G. Woodward, gardener to Roger Leigh, Esq., Barham Court, Maidstone, notwithstanding the terrible hailstorms, which so nearly ruined all he had early in the year. His samples were really magnificent, good dishes being shown in Conference, Fondante Thriot, Le Brun, Pitmaston, Louise Bonne, and M. Marillat. The Le Brun is a soft-yellow coloured Pear, very smooth and beautiful. Mr. W. H. Bacon, The Mote, Maidstone, came next with a beautiful display of M. Marillat, also Directeur Hardy, Beurré Bachelier, Louise d'Ucele, Beurré Alexandra, Lucas, and Beurré Baltet Père. The third was taken by Mr. J. Cornford, of Quex Park, Thanet, who had a well-selected assortment.

For nine dessert Pears, Mr. Hy. Parr, Trent Park, New Barnet, was the only exhibitor, with good Beurré Clairgeau, Thompson, Doyenné du Comice, and Doyenné Boussoch. For the six dishes, Mr. J. Moor, Banstead Wood, Surrey, was second to Mr. W. Mancey, Upper Gatton Park, Merstham, the latter showing clean, fine fruits of Doyenné du Comice, Marie Louise, Louise Bonne, Marie Louise d'Ucele, Durondeau, and Pitmaston Duchess.

The other classes (for Peaches and Plums) in this section will be briefly reported in our next.

#### DIVISION IV.

Special district county prizes, for amateurs and gardeners. Each class has a section for Apples, and another for Pears, distinguished by "A.A." for Apples, and "B.B." for Pears. In our report we

omit these, placing Pears after Apples. The prizes are valuable, amounting throughout to £1 for firsts, and 15s. for seconds, with third class single railway fare from exhibitor's nearest station to London. All the fruits are grown out of doors.

SURREY, SUSSEX, HANTS, DORSET, SOMERSET, DEVON AND CORNWALL.—For Apples W. Stowers was first with Bramley's Seedling, Cox's Orange, Bismarck, Peasgood's Nonesuch, Warner's King, and King of the Pippins. Mr. Coleman was a fair second.

The first prize for six dishes of dessert Pears was won by Mr. Coleman with good examples of Durondeau, Pitmaston Duchess, Duchesse d'Angoulême, Doyenné du Comice, and others.

WILTS, GLOUCESTER, OXFORD, BUCKS, BERKS, BEDS, HERTS, AND MIDDLESEX.—Six dishes of Apples—four cooking, two dessert. First, Mr. J. Elliott, gardener to J. F. G. Bannatyne, Esq., Haldon House, with Annie Elizabeth, Ecklinville, Peasgood's Nonesuch, Loddington, Ribston Pippin, and Worcester Pearmain; Mr. H. Aveny, gardener to R. P. Grace, Esq., was a moderate second. Mr. T. Turton was first for Pears, and Mr. G. Grigg second.

ESSEX, SUFFOLK, NORFOLK, CAMBRIDGE, HUNTS, AND RUTLAND.—Mr. J. Ellett, gardener to Sir A. K. B. Osborn, Bart., Chicksands Priory, Shefford, had the best six dishes of Apples, which included good samples of Golden Noble and Blenheim Orange; Mr. W. G. Davies, gardener to A. W. G. Wright, Esq., Newent, Gloucestershire, was second. For six dishes of Pears, Mr. W. H. Bannister, gardener to Mrs. St. Vincent Ames, Cote House, Westbury, was first with fair samples; second, Mr. A. Carlisle.

#### DIVISION V.

Single dishes of fruit grown in the open air. Open to gardeners and amateurs only. Two prizes are given in each class (except 52, 61, 64, 70, 71, 75, and 88), first, 7s.; second, 5s.

#### Choice Dessert Apples.

ALLINGTON PIPPIN.—First, Mr. R. Milner, gardener to Miss Talbot, Margam Park, Port Talbot; second, Mr. W. Stowers, gardener to G. H. Dean, Esq., Sittingbourne. Ten exhibits appeared in the class.

AMERICAN MOTHER.—Two entries. First, Mr. T. H. Slade, gardener to Right Hon. Lord Poltimore, Exeter;

second, Mr. C. J. Salter, gardener to Mrs. Haywood, Woodhatch, Reigate, with poor samples.

BLENHIM ORANGE (small, highly-coloured fruits, which will pass through a 3in. ring).—First, Mr. Geo. Grabbe, gardener to T. Lloyd Davies, Esq., Park House, Huddlestons; second, Mr. W. Stowers. Ten entries appeared in the class.

CHARLES ROSS.—Messrs. Horne, of Cliffe, Rochester, awarded three prizes for this new Apple—£5, £3, and £2 respectively. Mr. J. B. Colvill, Sidmouth, was the only exhibitor in this class, and deservedly took first prize.

COX'S ORANGE PIPPIN.—Mr. W. Stowers was first here with good fruits, and Mr. W. Lintott, gardener to Walpole Greenwell, Esq., Marden Park, second out of thirteen entries.

EGREMONT RUSSET.—Mr. Lintott first with a fine exhibit; second, Mr. D. McAinst, gardener to C. P. Wykeham, Esq., Leeds Castle, Maidstone. Five entries.

JAMES GRIEVE.—Three entries. First, Mr. J. Atkinson, Montrose Villa, Caversham; second, Mr. W. Harrison. The former were fine samples.

KING OF THE PIPPINS.—There were seventeen entries in this class, the first prize being won by Mr. McMurdie, and the second by Mr. W. H. Davies, gardener to A. W. G. Wright, Esq., Quarry House, Newent, Gloucestershire.

MANNINGTON'S PEARMAN.—First, Mr. John Lee, Kingscroft, Higher Bebington, Cheshire, with good samples; second, Mr. E. Coleman, gardener to T. L. Boyd, Esq., North Frith, Tonbridge.

MARGIL.—First, Mr. A. Carlisle, gardener to G. J. Gribble, Esq., Biggleswade; second, Mr. C. J. Salter.

PIPPIN.—Twelve entries. First, Mr. G. Grigg, gardener to the Right Hon. Earl of Ashburnham, Ashburnham Place; second, Mr. W. Stowers, with smaller but well-coloured samples.

Messrs. Veitch's Fruit Store at Langley. (See page 305.)

"ANY OTHER VARIETY."—In this class eight fruits were required to a dish for the judges to be able to taste two of them. There were twenty-four entries in this class, the first prize being won by Mr. W. Harrison with a good dish of Washington, Mr. W. H. Davies was second with a grand dish of Worcester Pearmain, Mr. A. Carlisle was third with the same variety, and Mr. W. Allen fourth with St. Edmund's Pippin.

#### Choice Cooking Apples.

BISMARCK.—First, Mr. W. Stowers; second, Mr. H. H. Williams, Pencalerick, Truro; six entries.

BLENHEIM ORANGE (large fruits).—Nine entries; first, Mr. A. Basile; second, Mr. W. F. Stowers, both good dishes.

BRANLEY'S SEEDLING (Prizes by Messrs. H. Merrywell, Southwell).—Nine entries; Mr. Stowers was first with a grand dish, and Mr. R. Smith, gardener to Mrs. G. Pearson, Brickendonbury, Hertford; Mr. A. Basile, third.

GASCOYNE'S SCARLET SEEDLING.—Five entries; first, Mr. W. Stowers; second, Mr. Lintott.

GOLDEN NOBLE.—Mr. W. H. Davies was first in seven entries; second, Mr. Stowers.

LANE'S PRINCE ALBERT.—A fine class of thirteen entries. First, Mr. Stowers, with grand fruit; Mr. C. J. Salter second.

LORD DERBY.—Mr. Wallace, gardener to H. E. Smith, Esq., Roehampton, was a good first here, followed by Mr. Stowers.

MÈRE DE MENAGE.—First, Mr. Stowers, with big samples; second, Mr. C. Page, gardener to J. B. Fortescue, Esq., Dropmore, Maidenhead.

NEWTON WONDER (prizes by J. R. Pearson and Sons, Lowdham, and open only to exhibitors living in Cardigan, Radnor, Shropshire, Stafford, Warwick, Northampton, Bedford, Cambridge, Essex, or counties further north).—This was a good class. The first prize went to Mr. W. Allan, with fine examples. Mr. J. Day was second, and Mr. W. H. Divers, Belvoir Castle, third.

NEWTON WONDER.—Prizes by Pearson and Sons. Open only to exhibitors living south of the before-named counties. First, Mr. W. Stowers, with fine examples; second, Mr. W. Lintot; and third, Mr. W. Strugnell Rood Ashton.

PEASGOOD'S NONESUCH.—Four entries. First, Mr. Stowers with grand samples; second, Mr. Chas. Page.

STIRLING CASTLE.—Eight entries. First, Mr. Chas. Ross, gardener to Col. Archer Houblon, Welford Park, Newbury; second, Mr. T. Turton, gardener to J. K. D. Wingfield Digby, Esq., M.P., Sherborne Castle.

WARNER'S KING.—First, Mr. J. Lee; second, Mr. Stowers.

"ANY OTHER VARIETY."—This was a strong class, and the first prize went to Mr. C. J. Salter, for a fine dish of Stone's; second, Mr. J. Vert, gardener to Right Honourable and Rev. Lord Braybrooke, Saffron Walden, with the same variety; third, Mr. Coleman, with Royal George; and Mr. H. Aveny fourth, with the same variety.

#### Choice Dessert Pears.

BEURRE SUPERFIN.—Three exhibits. First, Mrs. W. Turton second, Mr. W. H. Bannister.

COMTE DE LAMY.—First, Mr. T. W. Herbert, gardener to J. T. Charlesworth, Red Hill. One exhibit.

DOYENNE DU COMICE.—A fine class. First, Mr. E. Gilmore, gardener to Lord Northbourne, Northbourne Abbey, Kent; second, Mr. J. W. Barks, gardener to H. Partridge, Esq., Bletchingley, Surrey.

DURONDEAU.—Three entries. First, Mr. T. Turton, with fine samples; second, Mr. W. Allan.

ÉMILE D'HEYST.—Three entries. First, Mr. W. Allan, with fine samples; second, Mr. D. McAinst.

LOUISE BONNE OF JERSEY.—Five entries. Mr. G. Grigg, first; second, Mr. W. Allan. Both good.

MARIE LOUISE.—Four entries. Mr. W. Allan, first; second, Mr. W. Mancey, gardener to A. Bensey, Esq., Upper Galton Park, Merstham.

PITMASTON DUCHESS.—A fine class of six entries; Mr. J. W. Barks was a good first; second, Mr. W. Allan.

THOMPSON.—First, Mr. W. Allan, who was the only exhibitor.

"ANY OTHER VARIETY" (eight fruits).—Mr. Allan, first, with Striped Williams, Bon Chrétien; second, Mr. W. Harrison, with Doyenné Boussoch; third, Mr. J. W. Barks, with a good dish of Fondante Thirriott.

#### DIVISION VI.

Fruit, miscellaneous. The Gold Medal premier award in class 89 for home preserved or home-bottled British-grown fruits, open to all, was secured by the Lady Warwick College, from Studley. The exhibit occupied a space 8ft by 6ft, and the fruits were shown in clear glass jars, a very well staged display, and the preserves were varied and excellent. Messrs. T. E. Austin and Co., St. James' Works, Kingston-on-Thames, were here beaten, the fruits appearing not nearly so fresh and tempting as those bottled by the Hostel folks. Mrs. M. A. Bangor, of The Chalet, Southwick, was not placed.

Class 89, F.—This class was also open to all, and could include "foreign grown and preserved or bottled fruits." The only exhibitor here was Miss C. E. Martin, Willowbrook, Auburn, New York, who had beautiful Pears, green Tomatoes, &c.

Bottled fruits (class 90), eighteen bottles of exhibits, to include six different kinds at least. Mrs. C. P. Markham, Hasland Hall, Chesterfield, beat Mrs. E. Beckett, Aldenham, Elstree, there being three exhibits.

Bottled fruits, class 91, exhibits of a dozen bottles. Mr. J. Bushell, of Sandling, near Maidstone, led; and Miss Alice M. Smith, The Bungalow, Southwick, Brighton, second, only two exhibiting.

#### VEGETABLES.

In the prize schedule, the Society notifies exhibitors that "official labels for the correct naming of the various items will be supplied," and, further, "that correctness in naming will have great weight with the judges."

#### DIVISION VII.

Starting at class 92, the vegetable classes ran to the 161st, making a total of seventy classes, the final one being for "any vegetable not mentioned above," thus leaving an opening for originals.

One of Bunyard's Pot Plums.

Reference is made to the pot trees at Allington (Messrs. Bunyard and Co.'s nursery) on page 306.

In class 92, for a collection of vegetables occupying not more than 100 sq ft, and open only to the trade, the only exhibitors were Richard Smith and Co., of Worcester, to whom a silver-gilt Knightian Medal was awarded.

In 92a, for a collection occupying 50 sq ft, open to the trade only, the premier position was held by Messrs. R. Veitch and Son, of Exeter, who obtained a Silver-gilt Knightian Medal. Messrs. Bunyard and Co., Ltd., had a Silver Knightian Medal; and Messrs. Cheal and Sons had a Silver-gilt Banksian Medal.

In the class for amateurs' collections of vegetables, occupying a space of 17ft by 3ft, four competitors appeared. Mr. Beckett, Aldenham House, led the way, and showed in his usual grand style, exhibiting an interesting variety of well grown vegetables. The arrangement of the exhibit was also very good, though the number of sorts seemed to be taken into consideration quite as much as quality. Notable varieties of vegetables staged were Celery, Early Rose and Giant White; Leek, Dobbie's International; Parsnip, Dobbie's Selected; Onions, Ailsa Craig and White Spanish; Potatoes, Sion House Prolific, Edgecote Purple, Sir John Llewelyn, and Lord Tennyson; Carrots, Red Elephant and New Red Intermediate; Cabbage, Winningstadt; Turnips, Golden Ball and Model; Mushrooms; French Bean, Canadian Wonder; Scarlet Runner, Hackwood Success; with Lettuces and other salads.

The second prize was well won by Mr. J. Gibson, gardener to R. W. Hudson, Esq., Danesfield, Marlow, who staged an ex-

hibit almost equal to the former in point of merit. Quality characterised all the vegetables, which comprised, amongst others, Cabbages, Flower of Spring and Green Colewort; Savoy, Perfection and Sugar Loaf; Onions, Ailsa Craig and Cocoonut; Leek, Royal Favourite; Potatoes, Edward VII., Britannia, and Satisfaction; Tomatoes, Polegate and Best of All; with Peas, Autoerat, Early Giant, and Gladstone. The third prize was won by Mr. W. Fyfe, gardener to Lady Wantage, Lookinge Park, Wantage; and the fourth by Mr. G. Lock, gardener to B. H. Hill, Esq., New Coombes, Crediton, Bath.

Mr. J. Bowerman, gardener to Lord Bolton, Hackwood Park, Basingstoke, had the best collection of vegetables, occupying a space of 24 square feet. The collection was a very high-class one, and comprised a large number of vegetables, including fine examples of Celery, Giant White and Standard Bearer; Onions, Excelsior and Blood Red; Leek, International; Cauliflowers, Autumn Giant and Autumn Mammoth, Sir John Llewelyn, Major, and Up-to-Date; Runner Bean, Hackwood Success; Tomato, Polegate; and Beet, Crimson Globe. The second prize was won by Mr. A. Basile, gardener to the Rev. Thos. McMurdie, Woburn Park, Weybridge, who showed, amongst other things, good dishes of Windsor Castle Potatoes, Intermediate Carrots, and Prizetaker Leeks. Mr. S. Hines, gardener to D. P. Bouverie, Esq., Coleshill House, Highworth, was a fair third.

Potatoes were well shown in the several exhibits that competed for medals in the trade division. Mr. R. W. Green, Wisbech, Lines, was a good first with clean tubers of The Factor, Cigarette, Victor, Evergood, Early Puritan, Northern Star, Duke of Albany, General Roberts, Snowflake, Snowdrop, Ninetyfold, Green's Favourite, and Sir John Llewelyn. Mr. J. B. Colville, Sidmouth, was a good second, and staged fine dishes of Royal Sovereign, Best of All, The Factor, Ideal, Satisfaction, and Springfield. Messrs. R. Veitch and Son, Exeter, occupied the third position.

In the amateurs' section, Mr. B. Ashton, gardener to Lord Lathom, Ormskirk, won the first prize for twelve varieties of Potatoes, with clean samples of Menarch, The Sirdar, Discovery, Carltonian, Ideal, Evergood, Duke of York, Webb's New Guardian, General Buller, Snowball, Snowdrop, and Fylde Wonder. Mr. A. Ayling, of Newhaven, took second prize with a good collection of tubers, which, however, struck us as being slightly rough; and Mr. Silas Cole, gardener to Lord Speneer, Althorpe, was third.

Division VIII., open to amateurs only, together with our notices of miscellaneous exhibits in the sundries tent and elsewhere, will be furnished next week.

## Societies.

### National Chrysanthemum.

The first meeting of the Executive Committee of the above society for the present season was held at Carr's Restaurant, Strand, W.C., on the 21st inst., Mr. Thomas Bevan in the chair, there being a good attendance. General satisfaction was expressed at the resumption of the business meetings of the society in a position so central.

The Secretary reported the death of Mr. James Smith, of Mentmore, one of the judges at the November exhibition, and a vote of condolence and sympathy with Mrs. Smith and her family was passed, the members having in grateful remembrance the kind assistance rendered by Mr. Smith on the occasion of the outing of the society at Mentmore a few years ago. Mr. George Woodward, The Gardens, Barham Court, was elected a judge of fruit, &c., in the place of Mr. Smith. Mr. F. Tapper having gone with the family he served at Sundridge Park, from thence to Brackley, resigned his seat on the Executive Committee with regret, and Mr. Geo. Caselton, superintendent of the Crystal Palace gardens and grounds, was elected in his place. Mr. C. H. Payne reported that the new catalogue was in the press, and would be issued at the earliest possible moment. A lengthy correspondence was read with the Crystal Palace Company in reference to the directors having arranged to hold a poultry show in connection with the November exhibition of the society, and thereby shutting out the society from the northern nave and central transept. The Secretary was instructed to send a strong protest from the Committee. The terms of an agreement with the Crystal Palace Co., duly signed and attested, was approved.

Mr. C. Harman Payne reported that the French National Chrysanthemum Society would this year hold its annual exhibition at Lille on the 6th of November. Any English friends would receive a cordial welcome. Also that a deputation from the French Society would attend the exhibition at the Crystal Palace on November 10; and it was resolved that they be entertained by the society. Mr. Payne also reported that the American Chrysanthemum Society held its first exhibition in 1902, and had issued an interesting report of its proceedings. The Chairman and Vice-Chairman also reported upon their visit to the recent Ghent Exhibition, to which they had been accredited as representatives from the society.

It was resolved that the annual dinner of the society should take place on November 25, subject to the ability of the President to preside on that occasion. The Secretary reported as to the annual outing of the society on July 13, at Park Place, Henley-on-Thames, attended by 193 persons, and said all the expenses had been met by the sale of tickets, leaving a balance to be carried to the general funds of the society. It was resolved by acclamation that this being the first meeting of the Committee after the outing, a letter of thanks be sent to Mr. Noble and Mr. Stanton. Fifteen new members were elected, and one society was admitted to affiliation. A vote of thanks was passed to the Chairman for presiding.

### Bristol Gardeners'.

The closing meeting of the summer session was held at St. John's Parish Room on Thursday, Mr. E. Poole, F.R.H.S., presiding over a good attendance. The lecture was given by Mr. H. Kitley, his subject being "The Duties of a Gardener." He traced the life of a gardener from the time when he would enter an establishment as "garden boy" until he managed to reach the highest position in his profession. Amongst many good points made by the lecturer was the necessity for beginning at the bottom rung.

Gardening, he claimed, demanded and deserved the closest attention on the part of the student who would become master of the art. It demanded earnest toil, and it deserved his best powers. Poorly remunerated though the average gardener is, yet he has the assurance of belonging to a most useful calling. Mr. Kitley was heartily thanked for a lecture which, from beginning to end, maintained a very high level. Prizes offered for two bunches of Grapes were secured by Mr. J. B. Brain (gardener, Mr. Atwell); Mr. A. Cole (gardener, Mr. Bird), and Mr. W. F. Powell (gardener, Mr. Raikes). Certificates of merit were awarded Mr. A. Cole for three Cockscombs, Mr. Ambrose for a collection of Sweet Peas, and Dr. Eager (gardener, Mr. Cane), three *Odontoglossum crispum*. A certificate of special merit was recommended for a box of fine *Magnum Bonum* Plums, sent by Lady Cave (gardener, Mr. Poole).

Cordon Pear. Colmar d'Été. Pyramid Pear on Quince. Emile d'Heyst.

ORCHID HYBRIDISATION.—Mr. Charles H. Hurst, F.L.S., at the British Association's recent meeting, treated on "Recent Experiments in the Hybridisation of Orchids." Speaking first of the recent progress in Orchid hybridisation, he said the first hybrid was raised in 1856, and there were 1,300 distinct crosses in 1903. The majority of hybrids were fertile. Orchid hybrids offered a wide field to the student of inheritance. Intermediate, dominant, and false hybrids were then dealt with in detail, and, as regards the last-named, further experiments into the nature of one-sided inheritance were, he said, urgently needed.

The notes on the Allington Nurseries (page 303) bear reference to the fine form and early fertility of the pyramid trees there, and the same applies to cordons. The woodcuts, from photographs of actual specimens, will substantiate what has been written.

## Oxfordshire County Council.

### Trial Allotments Competition.

The fifth annual exhibition of the produce grown on the Trial Allotments took place at St. John's College, Oxford, on Thursday, the 17th ult. Nine plots competed, viz., Bicester, Bodicote, Crowmarsh, Chipping Norton, Clifton Hampden, Dorchester, Goring, Witney, and Woodstock. There was a marked progress on previous years, both in the quality and keenness of the competition. The plot gaining the highest number of points at the show, plus the points awarded at the three visits made during the season to the allotments, carries off the cup and a gold medal.

This year Bodicote claimed premier position with 365 points, Witney (silver medal) following very closely with 363½ points, Crowmarsh (silver medal) 360½ points, Bicester 356½ points, Clifton Hampden 320½ points, Dorchester 297 points, Chipping Norton 287½ points, Goring 260¾, and Woodstock 226 points. Each plot exhibited as per schedule.

The Potatoes shown were above the average in quality; thirty-one out of thirty-six dishes staged gaining five to seven points each out of a maximum of seven. The twelve dishes of Peas staged were excellent for the season. Broad Beans, Brussels Sprouts, Cauliflower, Onions, and Leeks were exceptionally good. Mr. P. Elford, M.A., County Education Secretary, entertained the stewards, judges, and others to lunch in the College Hall.

#### SCHEDULE OF THE VEGETABLES EXHIBITED BY EACH TRIAL ALLOTMENT ON THURSDAY, SEPTEMBER 17, 1903, IN ST. JOHN'S COLLEGE, OXFORD.

Class.	Subject.	Number for a dish.	Variety.
1	Potatoes .. .. .	6	a. The Sutton Flourball. b. Duke of York. c. Ninety-fold. d. Windsor Castle.
2	Peas .. .. .	20	a. Early Giant. b. Perpetual.
3	Climbing French Beans .. .. .	20	Tender and True.
4	Broad Beans .. .. .	12	a. Mammoth Longpod. b. Prolific Longpod.
5	Runner Beans .. .. .	20	Best of All.
6	Beet .. .. .	2	Pine-apple.
7	Brussels Sprouts .. .. .	20	a. Exhibition. b. Dwarf Gem.
8	Cauliflower .. .. .	2	a. Purity. b. Autumn Mammoth.
9	Cabbage .. .. .	2	Sutton's Earliest.
10	Savoy .. .. .	2	a. Perfection. b. Best of All.
11	Cos Lettuce .. .. .	3	Superb White.
12	Cabbage do. .. .. .	3	Satisfaction.
13	Celery .. .. .	2	a. A1. b. Solid White. c. Gibbs' Pink.
14	Carrots .. .. .	6	a. Favourite. b. Scarlet Intermediate.
15	Leeks .. .. .	6	Royal Favourite.
16	Onions .. .. .	9	a. A1. b. Bedfordshire Champion. c. Nuneham Pk. d. Cranston's Excelsior
17	Parsnips .. .. .	6	Tender and True.
18	Turnips .. .. .	6	Red Globe.
19	Jerusalem Artichokes .. .. .	10	Sutton's White.
20	Vegetable Marrows .. .. .	2	a. Bush White. b. Long Cream.

N.B.—Parsley is allowed for garnishing.

Misty mornings, and dull but fine days.

### Hardy Fruit Garden.

**FILBERTS AND COB NUTS.**—The nuts should be gathered during a dry period while they still remain in the husks, if they are to be preserved until Christmas or later. After gathering them, lay on a board in a dry place, shading from the sun, but admitting plenty of air. The object is to dry all the moisture out of the husks, as if this is not done mouldiness will set in. Drying in the sun extracts the moisture too quickly, and causes the husks to become brittle. The nuts may be stored in jars in a dry, cool, frost-proof structure, or laid thinly in a dry loft, covering them with straw.

**STRAWBERRIES.**—The present is a suitable time to establish a plantation of Strawberries. Such plantations, however, ought not to be expected to give a full crop the following season, especially if the plants inserted now are small or not well rooted. Good plants with well developed crowns, and a mass of fibrous roots adhering to a ball of soil, can be lifted and planted almost without their receiving the slightest check, so long as they are dealt with when the ground is moist. The position for planting should have received previous preparation, the digging and trenching being liberal and deeply carried out, a free use being made of rotted manure for enriching the ground. Prior to planting, firm the ground by well treading. As a general rule arrange the rows 2ft apart. Some of the strongest growers may require a wider distance of 3in to 6in beyond this, giving them also more space in the row. Ordinary growers may be 15in, while the strongest need not be more than 18in asunder in the rows.

In planting varieties without balls of soil attached to the roots, some care must be expended in spreading out the fibres in the soil. The best way is to form little mounds, and spread them out round this, having some fine soil handy to sprinkle over and make firm. Should the weather be dry give a watering immediately.

Beds of old plants from which the young rooted runners have been obtained will require after this, the removal of all the superfluous growth. Cut off the runner wires close to the old plants, at the same time clearing off any dead foliage. The runners which have rooted into the soil between the rows, and are not otherwise required, should be hoed up along with weeds, unless the latter are deep rooted, or of a perennial character, when it is best to fork these out, though involving, as it does, a little more trouble. Follow with a light mulching of short manure and soil.

**ROOT-PRUNING FRUIT TREES.**—Any fruit trees which have made more than usually luxuriant growth should receive a wholesome check, which root-pruning will give. Trees or bushes that have made 3ft or more of current year's wood have strong roots descending deeply into the subsoil, and these must be judiciously shortened. Where the root-pruning must necessarily be severe it will be best to only treat one half of the tree in one season, leaving the other half for the following year. The operation of root-pruning consists in first taking out a trench 3ft from the stem, going down a fair depth. Any strong roots met with may be cleanly severed on the side of the trench nearest the tree, but preserve all the fibres. The strongest roots will be found probably descending straight down. If so, cut them transversely across, paring the ends smoothly and cover with a coat of tar. Having done this satisfactorily, fill in the soil again, using a little fresh, loamy material mixed with bonemeal and wood ashes. Make the soil firm as the work proceeds, and lay out the fibres, raising them also to a more horizontal position than they previously were. A good watering will prove beneficial if the weather is dry and the soil is rather crumbly in character.

**PEACHES AND NECTARINES.**—The crop has been gathered from the majority of the trees, therefore give special attention to relieving them also of superfluous shoots. Those which have borne the fruits are no longer required, and weakly, as well as crowded shoots may be dispensed with. Keep the roots active near the surface by maintaining the soil fairly moist. Very often the trees are suffering from lack of moisture, which produces many ills, and throws trees into a debilitated state, rendering them an easy prey to insect attacks. Young trees growing strongly should be lifted and slightly root-pruned, re-planting quickly. A little bonemeal and wood ashes may be used with the fresh compost employed for renovating the roots of old trees. Freely syringe old trees, or young ones either, if the foliage has been attacked with red spider.

**GATHERING FRUIT.**—Continue to gather all the varieties of Apples and Pears which are in a proper condition for so doing. Unfortunately, many fine fruits have been damaged by the wind

in the recent gale, hence those which are bruised should be stored by themselves. Also the large quantities of fruit, which have been blown down and now stored, must be frequently examined for decaying specimens, promptly removing these.—EAST KENT.

### Fruit Forcing.

**VINES: EARLY FORCED HOUSE.**—Vines that are to furnish ripe Grapes with certainty next April should be started by the middle of November. It is not an advisable procedure to start Vines permanently planted at so early a season. Very early forcing places a great strain on them through their having to make growth when the natural conditions are at the worst for elaboration and assimilation, and to rest at the hottest part of the year, there being great danger of the foliage collapsing from attacks of red spider, or ripening too early from climatic conditions. This may cause the buds that are to furnish the next year's crop to start into growth at the time the Vines should be resting. It can only be avoided by retaining some lateral growths as an outlet for any sap which the roots absorb, and it will not do any harm, but good, by securing a considerable amount of stored matter, always provided the lateral growths are not allowed to interfere with the free access of light and air to the principal leaves. These laterals should be removed gradually and continuously from late August until early in September, so as to admit of the Vines intended for starting early in November or December being pruned by, or soon after, the middle of September; and they will not bleed, nor will the buds start into growth if the house be kept cool and dry. There is no need to wait until the leaves are all down, as the resting having set in, there will not be any upward flow of sap; but bear in mind this must have been secured by the gradual reduction of the laterals and the resting apparent, otherwise the pruning buds may start. If not already pruned, lose no time in performing it; also the Vines to be started in December, not deferring pruning beyond the time the foliage commences to fall, so as to give the Vines a few weeks' rest.

Outside borders are a great mistake in early forcing Vines, especially Muscats, and whether heated below by hot water pipes, or above by fermenting materials, not nearly equal to due internal borders, ample, for the roots. Still, there are such borders, and have to be made the most of, or the Vines in them. The old practice of shielding them from the heavy autumnal rains by spare lights has not been improved upon, as it lets the border have the benefit of the sun that may appear, and that without depriving the soil of air. Thus, later on, the border can be covered with a good thickness of dry leaves or Fern, with some litter on top, so placed as to throw off some of the wet, and the heat thus covered up remains most of the winter. Where there may be plenty of leaves and stable litter, the well-tried practice of keeping out cold and getting some warmth into the border by placing them on top, renewing them from time to time, answers as well as ever. But we do not advise such procedure where better conditions obtain, yet adaptation to circumstances is a fine thing, and marks the cultivator as successful or otherwise. The very old practice of using fermenting material inside early forced vineries has not been bettered, as ridges of sweet fermenting material always give off heat, moisture, and nutrition, favouring good breaking and development of the growths, besides saving fuel. In the heap fashion ridges, like outdoor and indoor, for a very successful Grape grower uses the stuff for growing Mushrooms, and then spreads the beds over the border as a mulch for the Vines. Three parts of leaves, Oak or Beech, and one of stable litter, thrown into a heap a week or ten days before being placed in the house, get warm, then placed in ridges on the border allowed to become hot, then turned a time or two, give out all the heat that starts the Vines, and the beds are spawned, earthed, and anon lots of Mushrooms appear; so there is a sweet air for the Vines after they start, and the roots come into the sweetened material.

The whole thing means abundance of nitrogen, for the old spawn decays along with the manure, prime stuff speedily passing into ammonia, and with occasional sprinklings of air-slaked lime soon gets into nitrate, and better, into the Vines. This may be a wrinkle for someone hard set to make ends meet. Anyway, we advise the ridges of fermenting material in early forced vineries, always using that rare article, discriminative judgment, where there are plants, sweetening the manure properly, as the foliage may be seriously injured by the vapour given off. Therefore mix well together when thrown into the heap, damping the materials if dry, turning when getting warm, again damping if necessary, and when well warmed through they are fit for placing in the house.

**YOUNG VINES.**—The laterals must now be gradually cut back, letting the sun have a clear effect on the principal growths, not removing them all at once, but by degrees, getting them near the main rod with little further delay, so as to leave nothing but the chief cane or canes, and thus the principal leaves will plump the buds. Those having a tendency to con-

tinue growing to a late period may be checked by stopping the shoots moderately, facilitating the ripening by a high and dry temperature by day, turning off the heat, and keeping the ventilators, except during frost, open at night. Afford water only at the roots to prevent the foliage becoming limp. This will harden the wood and tend to induce maturity of the growths.

—ST. ALBANS.

## THE BEE-KEEPER.

### Locality and Position of Hives.

The influence of locality has a great deal to do with the results obtained in bee-keeping, and its importance is only brought home to us when the harvests obtained in different districts are reflected upon. Again, how many apiarists are there who consider whether a stock will give better results facing a different point of the compass?

With regard to the position of hives, ample experience confirms the idea that on a slope with a dry ground, facing south, is the best, and if such a situation is also enclosed by hedges or walls about 5ft high, on as many sides as possible, and the hives face where the southern sunbeams warm, and the N.E. winds cannot touch, the bees will obtain sunshine before, and shade after noon, which, together with a still, warm air, represent the apiarist's ideal.

In an enclosure of this kind the difference between any southern aspect, S., S.W., or S.E., is of little consequence, as the cold winds do not come from the south. The argument that the air in spring in an enclosed situation, being warmer, entices the bees to fly, and, on rising to a higher level, they are chilled and lost, is not altogether borne out by facts, one of which the detractors appear to overlook being that careful thermometrical observations show that no appreciable difference between the internal and external temperature is perceptible; while only an imperfect statement of the advantages of a calm air and protection from northerly and easterly winds has ever been made. For some phases of apiculture it possesses unrivalled benefits.

As is well known, one bee in spring is worth as much as a dozen in the autumn, as the increase in population depends upon the proper temperature of the brood nest being maintained in the early part of the year, and rapid increase is only possible in strong colonies. There is, however, another factor connected with rapid increase. If the hive is warm and snug, the temperature is maintained by fewer bees, the cold winds are avoided, and more bees are liberated for foraging. It has no doubt been noticed that in an unsheltered spot, when the evenings are chilly, numbers of the bees may be found on the ground around the hives, some of which bees are loaded with pollen. By fixing hives as described these bees may be saved. The explanation of their falling to the ground and remaining there is that on approaching the hive they, in order to alight, change the plane of oscillation of their wings, and in this position a puff of wind is sufficient to blow them to the earth, where the cold causes contraction of the blood vessels, slower respiration and diminution of vital energy. The pulsations cease entirely at freezing point, so that, if not resuscitated within a short time, they perish.

The frequent complaints of the great mortality amongst bees in spring may be traced to some such simple cause as lack of sunshine, or the position of the hive allowing the cold winds charged with driving sleet to penetrate to the interior, or that the locality is unfavourable. Sunshine is very important in spring for many reasons, and hives should not therefore on any account be set in permanent shade. Nothing is more beneficial than the sun's rays, which gently raise the temperature, thus enabling the bees to change their cluster and rearrange their stores.

In such matters as these a little thought in the right direction, and the application of the requisite management, would render the pathetic accounts of losses less frequent. With the idea of being humane some even move their hives to a warmer spot to protect them from the elements during winter, and then leave them, overlooking the fact that if a sudden spell of warmth should come, and the bees become active, they return to the old spot, and many are lost.—E. E., Sandbach.

### Trade Catalogues Received.

Peter Henderson and Co., 35 and 37, Cortland Street, New York.—*Autumn Catalogue.*

John K. King and Sons, Coggeshall.—*Bulbs, &c.*

L. Späth, Banmschulenweg, Berlin.—*Fruits, Trees, and Shrubs.*

\* \* All correspondence relating to editorial matters should be directed to "THE EDITOR," 12, MITRE COURT CHAMBERS, FLEET STREET, LONDON, E.C. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense. In naming plants we only undertake to name species, or well-marked varieties, and only six on any one occasion. Florists' flowers we do not name.

**POTATOES TO NAME (J. G.).**—The varieties, so far as it is possible to tell from single tubers, are No. 1, Up-to-Date; No. 2, White Elephant.

**CARNATIONS WITH FLOWERING SHOOTS (A. B.).**—It is hardly likely that plants with no "grass" now will form any this season sufficiently strong to flower another season, but the roots will possibly survive the winter and make plenty of growth next season, and flower well the following year. The cuttings should not be torn off the stem, but cut so as to have one joint clear of the crown leaves, and being cut transversely below the lowest joint they should have the leaves from it removed. Insert the cuttings in sandy soil under a handlight, and keep them shaded until rooted.

**VINE LEAF SPOTTED (T. T.).**—The spots on the leaf are caused by the Vine leaf spot fungus (*Cercospora viticola*). It forms irregular, dry, brown spots on Vine leaves, and is most abundant during a damp season. The discolouration extends through the leaf more or less, and is most abundant on the lower shaded leaves. The disease is mainly due to keeping the house too close and moist; indeed, the parasite cannot spread, if indeed live, in a well-ventilated atmosphere, and with the foliage fully exposed to light. We are not aware that any repressive measures have been taken against this pest, and in our experience it does not occur or reappear when the temperature and atmospheric conditions are buoyant, a gentle warmth being maintained in the hot water pipes, so as to admit of a circulation of air in dull, cold, damp weather. The season has no doubt been favourable to the fungus, the wet circumstances and the relatively closer and moister atmosphere being responsible for its progress. After pruning the Vines may be dressed with a solution of iron sulphate, 1lb to a gallon of water, applying with a brush after removing the loose bark, but being careful not to injure the live bark. Another season ventilate more freely, and have the growths sufficiently far apart to allow the leaves full exposure to light.

**MANURE FROM HORSES THAT ARE BEDDED DOWN WITH SAWDUST (Constant Reader).**—We have used manure from loose boxes in which hunting horses were kept and bedded down with sawdust, and not found any injurious effects to crops in either flower or kitchen gardens, or even on grass or arable land. The only objection to its use we found is the liability to engender fungi, the mycelium of some of which spread from the sawdust into the soil, and affected the crowns of plants prejudicially, the mould either directly acting on the rootstocks or abstracting the nitrogen in the soil, and thus causing a weakly growth in the crop plant. This has chiefly occurred when the sawdust manure has been used in a raw state and as a mulch or top-dressing. We have also used the sawdust manure for growing Mushrooms. For ordinary purposes the manure was simply prepared by throwing into a heap and soaking thoroughly with liquid from the stable draining tanks, and as soon as heating, and before becoming so hot as to burn in the interior of the heap, turning, and again wetting if necessary, repeating this a few times until the rankness had passed off, and the violent heating been subdued; then the heap was allowed to rot in the usual way of manure heaps generally, and used in the ordinary course of manuring after three to six months' lying. This was on a gravelly soil of the oolitic formation. In the case of soil of a damp and vegetable nature, and perhaps in all cases of peat moss or sawdust being used for bedding, it is advisable to mix with the manure one-tenth of quicklime, slaked with water previous to use, mixing well with the manure after the violent heating has passed off and the heap thoroughly moistened throughout, and then allow to rot for a few months. Some prefer to slake the lime with a salt brine, using about one bushel of salt to six bushels of lime, the lime being slaked to a dry powder. The freshly slaked lime is spread in layers upon the manure, thoroughly moistened, in the proportion of about two bushels of lime to a hundred of manure, the layers of manure being about 6in thick, building up from

4ft to 5ft high, and of any convenient width and length. The manure, if thus treated late in autumn, will be ready for use in the following spring, and during that time it should be turned, outside to inside and top to bottom, two or three times.

**CHRYSANTHEMUM PLANT WITH LEAVES BROWNE (X. Y. Z.).**—The plant is quite sound in the root-stem and stem above ground, but the leaves are all dead, blackened, and hanging down, and lying close to the stem. It is affected by the Chrysanthemum leaf blight (*Cylindrosporium Chrysanthemi*), a parasitic fungus that causes dark, large blotches to appear on the leaves, which turn yellow, then shrivel up, brown or black, and the diseased leaves hang down and lie close to the stem. When attacked the flower buds do not expand, or very indifferently. No doubt the wet weather had a considerable effect on the foliage, but the fungus is the real cause of the collapse of the leaves, and for it no treatment has had any apparent effect. Doubtless the best course is to burn the affected leaves or destroy the plant as soon as the disease is observed.

**NAMES OF PLANTS.**—Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number. (A. O.).—1, *Hemerocallis japonica*; 2, *Saxifraga sarmentosa*. (F. W.).—*Liliodendron tulipifera* (Hendon).—1, *Genista aetnensis*; 2, *Spiraea Thunbergii*. (H. N. R.).—1, *Lychnis Chalcidonica*; 2, *Clematis flammula*; 3, *Rhus typhina*. (Filix).—1, *Aspidium molle*; 2, *Athyrium Filix-foemina*.

**NAMES OF FRUITS.**—Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number. (Surrey).—1, Stirling Castle; 2, Allington Pippin; 3, Egremont Russet. (P. W.).—Duchess of Oldenburg.

## The Brussels Dairy Congress.

A most notable collection of scientific dairying experts attended this international meeting, the latest of a series which have been held on the continent of Europe in various places. There were present 500 delegates from every part of the world, all the principal governments except our own being officially represented. Considering the important position which the dairy occupies in our national economy, our rapidly increasing urban population, and the increasing demand for dairy products, it is not very creditable to our authorities that they should neglect such an admirable opportunity of acquiring valuable information on a matter of national importance. There were certainly three or four Englishmen present, one being a well-known professor, but in no official capacity.

As one of the objects of these meetings is to form an international federation, it is most desirable that we should not be left out in the cold, but that, as the best customers for dairy produce, we should, at any rate, have some voice in the regulation of their production. It is not only as an agricultural, but as a generally economic question that it is so important, for the quality of the imports of dairy produce is of vital interest to our teeming population. To encourage the production of pure butter, and to see that margarine mixtures are not palmed off to the consumer in its stead, are surely worthy enough objects to our agricultural authorities.

It was in connection with the possible, or rather probable, adulteration of butter with margarine, that a most important and a very sharp discussion arose. A proposition was made that it was, and is, desirable that some substance should be mixed with margarine, so that if the latter should be used in the adulteration of butter its presence could be detected by chemists. Starch or sesame oil mixed with margarine can be readily detected, although they do not affect the sale of margarine as such. The carrying of the above proposition was much resented by the Dutch delegates, who left the Congress in a body. It appears that there is a system of private control in Holland which supervises the export of butter, and that butter sent into Belgium from Holland direct from the centre of control was found satisfactorily pure, but that butter which had been detained or recondemned had been adulterated with margarine. The Dutch Government propose to inaugurate a system of national control; but the simplest course would be to agree to the addition to margarine of a revealing substance, so that its presence in Dutch or any other butter can be easily ascertained. We can only hope that the recommendations of the Congress on this matter may bear fruit, and that the use of margarine for butter adulteration may be made impossible.

A visit was paid by the Congress to an institution which could with advantage be imitated in this country. It was a school at Louvain, managed, or rather under the supervision of religious sisters. The students are peasant girls who are taught science, three languages, cooking, laundry work, dress-making, dairying, poultry-keeping, and gardening, at a cost to the parents of £10 per annum, the balance of cost, we presume, being borne by the State. There are 1200 girls in residence, and everything is conducted on the most modern and up-to-date principles. Why should education of this kind be left to the private enterprise of such pioneers as Lady Warwick, who cannot, with limited funds at their command, provide education at such an easy rate as this? No doubt the county councils may do something in this direction if they are willing and the Education Department will let them, but we fear that the way they are cutting down expenses of the voluntary schools does not promise much liberality in the direction of secondary technical education.

## The Children's Employment Bill.

We have just been writing of Continental encouragement to true rural education. Here is a contrast. Under the provisions of the Education Acts, children will shortly have to remain at school until they are fifteen years of age, to assimilate knowledge which, to a large majority of them, will be of no practical use, while, as if keeping them so long at school was not sufficient

safeguard against their being taught to become useful citizens, here we have a Bill to effectually fill all the loopholes left open by the education authorities. We are confident that the rural elector who has got fully roused on the education question will show a very considerable interest in this side of it at the approaching general election. The Bill is evidently framed to deal with the evils which no doubt exist in connection with child employment in large towns, but it unfortunately also applies to rural districts where those evils seldom or rarely exist. The councils of cities and large towns are given power to make bye-laws under the Act, but rural councils are not given this power, and the Act will be administered under certain very drastic statutory provisions, which will almost entirely prevent the employment of children on the land. Girls who remain at school until they are fifteen go at once into domestic service, and it is the same with boys, except that keeping them at school so long, and allowing them no light breaking-in, they are disinclined for anything of a laborious nature, but nearly all aim at clerkships, being apprenticed to tradesmen or shop-keepers.

We are glad to see that so prominent a man as Mr. Jesse Collings sees the wrong which such a bill may bring about. A few words of his published by "Farm and Home" are worth repeating. "The whole Bill bristles with new made crimes, crimes for the most part not the result of dishonesty, misconduct, or moral wrong-doing, but connected with work. Labour is discredited and associated in the minds of the young with crime and with the policeman who has to enforce the law."

These are forcible words, but none too strong. There is a very wrong impression abroad that child labour means hardship. There is no such thing connected with it in rural districts. On the contrary, at certain times of the year occupation may be found for children on the land, which not only provides useful additions to the family exchequer and is beneficial to the community, but is a source of interest and enjoyment to the children themselves. We may add that by children the Act means all under sixteen years of age.

## Work on the Home Farm.

Except a field here and there, and a few rakings, the harvest is safe in stack, and thatchers are having a busy time. It is interesting to observe the difference in the manner of thatching on farms contiguous to each other. The thatching is all let by the square yard of thatch put on, the price varying from 1d. to 2d. per yard. On one farm, occupied by a farmer of the old-fashioned type, one who has weathered the storms which have swamped many a neighbour, and, although careful in his expenditure, yet scorning to do things in a slipshod way, the stacks are being covered as if the thatch were required to stand for three or four years, and the Thatcher who receives 2d. per yard earns little more than ordinary daily wages, though he may obtain much satisfaction from the knowledge that he has done especially good work. On the other side of a narrow lane is another stack yard. Here things are very different. One penny per yard seems good pay for the work which is being done, and it is the evident intention of the young and—may we say?—progressive occupier to make the best use of a threshing machine; and when his stacks are once dry, to give them little chance of getting wet again. The very shape of the stacks suggest instability, and they are evidently not meant to stay. The new system may spell profit to the farmer, but means death to the labourer and his employment.

A few fine days since harvest concluded have enabled us to cultivate and make a fair fallow of one piece of wheat stubble. The moist weather was encouraging the spread of a few clumps of couch, but they have been successfully dissipated into smoke, and that field will be no source of anxiety until spring comes again. Seeds ploughing has been somewhat hindered, but will now receive full attention.

Potatoes, which were dying off so fast, are now holding their own, and will not be ripe so soon by a week as we had expected. There is a very sharp inquiry by purchasers for winter delivery. Some lots are being hurried off to meet a strong spot demand, and Potatoes are distinctly booming. The great demand is for Up-to-Date, which has not yet been knocked out by the army of grand new sorts. We hear of Northern Star being sold at £8 per cwt. There must be a big lot of Northern Star in the country. Will there be customers for them at £160 per ton?

All kinds of sheep are hardening in price, but breeding ewes are very dear. Useful gimmers are making 60s. each, which is something like 10s. over last year's price. Rams also are much dearer. Beef is not a good trade, but there is a good prospect for Xmas beef, and graziers who can winter feed will be foolish to hurry off their bullocks. Cakes are reasonable now, and will pay for use, whilst there will be abundance of winter food to resort to in November.

## PLANTING SEASON

## PAULS' ROYAL NURSERIES

WALTHAM CROSS, HERTS.

12 miles from London. South Entrance four minutes' walk from Waltham Cross Station; West Entrance three minutes' walk from Theobald's Grove; both Stations on the Great Eastern Railway.

## SPECIALITIES:

**ROSES** in all forms, from open ground and in pots. Gold Medals in 1903 from Royal Horticultural and Royal Botanic Societies.

**FRUIT TREES** for the Orchard, Garden, and Forcing House. Hogg Memorial Medal, 1901.

**HARDY TREES** for Streets, Parks, and General Planting. Silver Medal from Royal Agricultural Society of England.

**SHRUBS**, both Evergreen and Deciduous.

**CLIMBING PLANTS**, Hardy and Greenhouse.

**RHODODENDRONS, CAMELLIAS, & AZALEAS.**

**HERBACEOUS PLANTS** in great variety.

**BULBS and SEEDS**, and all Garden Sundries.

PRICE LISTS ON APPLICATION. INSPECTION INVITED. Upwards of 1000 Medals, Prizes, and other Awards at leading Exhibitions during the past 42 years.

SOLE POSTAL ADDRESS—

**WM. PAUL & SON,**

## Journal of Horticulture.

THURSDAY, OCTOBER 8, 1903.

## The Planting Season.

ONE of the great delights which belongs to gardening is that there is no dull season, as each period of the year brings its work, its harvest, and plans for the future. When the first days of October come, the tinted and fast falling leaves proclaim in no uncertain manner that the sands of the year are running low, and that vegetation in the open air is approaching the resting period. But though Nature may be dropping into inactivity, it is no time for the gardener to do so, for undoubtedly it is during the autumn months that the foundation should be laid for the successes of another year, and in some cases for the triumphs or failures of many succeeding years. Yes, truly, some of the soundest work of the gardener is done in the time of autumn.

Plans will already have been laid, and as fast as opportunities occur, preparations will be made for planting operations of various descriptions which are to be carried out between November and March. Every man who plants a tree or shrub of any description should fully realise that he is doing work which may for generations stand as a monument either to his capacity or ineptitude.

When once the full force of this point is grasped the labour connected with planting becomes interesting, if not engrossing, and even under unfavourable circumstances ways and means are found for securing good results. Fortunately, private gardeners as a body seem to recognise the importance of thoroughness in all matters connected with planting, and it is rare indeed in any good garden to find such work being scamped, because the chief, when not actually taking part in the operations, keeps a very keen eye on the operators when extra hands have to be engaged, or distributes

READERS are requested to send notices of Gardening Appointments or Notes of Horticultural Interest, intimations of Meetings, Queries, and all Articles for Publication, officially to "THE EDITOR," at 12, Mitre Court Chambers, Fleet Street, London, E.C., and to no other person and to no other address.

**Cross & Son, Wisbech.**

such hands among his own trustworthy men. There is, however, a great deal of planting done throughout the country each year, under the superintendence of men who have never had any practical experience of such work, and as the staff who do the work have often had no real training, and are only interested in earning a labourer's pay, it is not surprising that the results are frequently disastrous to those who have to pay the piper. It cannot be too emphatically stated that anyone who has planting to do on a large or small scale will always find it wise economy to employ reliable men; in the former case an experienced planter who will see that the work is done as it should be, or have the whole matter carried through by a nursery firm of repute. When there is only a little to be done, get a trustworthy man, who knows how to plant and whom you can trust to do it well. After such a man has been found pay him well, and do not expect him to use both brains and hands for the pay of a labourer.

Thousands of pounds are wasted in Britain every year over planting operations, through the craze for cheapness. Trees and shrubs are picked up at the lowest possible cost, and stuck into the soil by under-paid men, who know very little, and care less, about the work in which they are engaged; and thus our fruit plantations, woods and shrubberies, are in many cases glaring examples of mismanagement. Those who have had the bitter experience of having in the past wasted money on unsatisfactory planting should see to it that this year a start is made in the right direction, and that the well-known methods of preparing the soil by trenching, or by making holes of sufficient size, and securing good drainage, are not neglected.

Turning to the subject of fruit growing, the thought naturally arises how far will the past—to many—disastrous season affect the planting of fruit trees? Well, my firm conviction is that there is only one condition which will prevent intending planters from carrying out their plans, viz., lack of funds. The season has been so bad that many growers who make a practice of extending their plantations each year will have to stay their hand till another season. Very few men who understand their business will drop making extensions because of a bad year, so long as they have funds at command, because they know that after a couple of lean years the time of plenty is near at hand, and there is still a fine opening for the grower of good samples of English Apples and Pears in our markets.

Although the season has been one of the worst on record for fruit growers generally, some have been fortunate, and are reaping a rich harvest. A few days ago I saw a grand Pear tree, on which the fruit literally hung like ropes of Onions, and the owner calculated he should get nine or ten pots of fruit, for which a customer had already been found at the splendid figure of 25s. per pot. The same tree, I was informed, had not failed to bear a crop annually for the last ten years. The variety was Thompson, a Pear of fine quality, which I can confidently recommend to intending planters.

In another case I found a fine set of standard Apple trees growing on high ground in an exposed position carrying splendid crops of extremely fine fruits. Nearly every tree was heavily cropped, and I jotted down sixteen varieties as being in that condition. This planting on high ground is a point which should be kept constantly in mind by planters. Do not be misled by results during one or two favourable seasons. We all know that the land in the valleys is generally better than that on the hills, and will give grand fruit (as a rule); but there are far too many years of failure through spring frosts, whereas on high ground the blossoming time is retarded, often just long enough to escape the dreaded frosts, and the wood produced in exposed positions, being shortjointed, always ripens, and blossoms well. Truly there is much to be said in favour of growing a fruit-tree—as well as an individual—sturdily.—H. D.

## Notes from Frenchay, near Bristol.

In the neighbourhood of Bristol are necessarily many gardens more or less familiar, from the fact that a speciality of some kind made of plant, flower, fruit, or vegetable within them. It would, I think, be safe to say that, numerous as are the gardens surrounding this notable Western city, none surpass Malmains for the richness of its one distinguishing speciality—Filmy Ferns.

Probably nowhere in the kingdom is there to be found so large collection of specimens at once so healthy, so large, or so happily accommodated. What makes them the more remarkable is that Captain Belfield, whose residence Malmains is,

collected and brought home the whole of these, and many other plants besides, from Australia and New Zealand many years ago. Spring rather than autumn is the better time to see *Todeas* in perfection; then the young fronds and the extremities of the older ones are clothed with the pale green verdure such as no other Fern can approach nor defy. The extremely moss-like fineness of the fronds when enclouded in mist display diamond-like pendants from beneath them. On a summer's evening a visit to this house bespangled with misty dewdrops gives an impression of coolness and sublimity scarcely known to greenhouse, and comparable only to the hoar frost scenes of winter.

The house itself is a most simple structure; were it otherwise, probably some of the noble grandeur of the plants would be lost, and, still more possible, the collection would long since have lost much of its fame and unique progress of character. The roof, almost flat, is supported by solid and deep outer walls, and is heavily shaded to shut out every vestige of a possible sunray. The aspect is an eastern one, and the use of fire heat seldom made.

Few probably realise the extent of cold these *Todeas* will endure; but Mr. Rye, the able gardener in charge, assures me that except in the most severe weather no warmth from the pipes is given until morning, and then only for an hour or so. Dewdrops have often been converted into icicles, the soil in the pots too hard for the finger to make an impress, and the surface of the fronds white rather than densely green—conditions that tend to paralyse with fear any save those who have grown accustomed to the scenes in winter time. Even those intimately concerned would voluntarily prefer to find the frost fiend absent, but it has been found that coolness, even if it touches the frost line, is better than the other extreme, fire heat not affording a desirable condition for these notable Filmy Ferns. They number some fifty or more; none of them, I believe, occupy less than 12in pots, while the larger specimens need a diameter of twice that amount. The largest raises its head 3ft from the soil, and has a growth of 4ft, with a spread of frond proportionate to its height and size. This giant is of the variety *T. pellucida*, but specimens of *T. superba* are not less remarkable. Beside these varieties there are *T. barbara* from Australia, and *T. hymenophylloides* from New Zealand.

With each springtime comes a crest of new fronds; the autumn finds a corresponding decrease of the older ones.

Adjoining is a large tropical house containing many more issues of the Captain's researches in foreign lands. Some have grown too large, and have been made the victim of the "woodman's axe." Others are trending upwards and recalling the many years of absence from their native homes. Tree Ferns such as *Cyathea*s and *Dicksonias*; Palms like *Areca sapida*, bearing its annual seed cluster; *Kentias Fosteriana* and *Bellmoreana*, *Dracaena Draco*, Cycads, *Chamaerops excelsa*, *Strelitzia regina*, *Musa*-like in size and vigour, and *Araucaria excelsa* are a few of the many tropical subjects that are so interesting. *Lycopodiums* grow splendidly under the shade of the Palms and other taller plants, and, occupying large shallow pans, are made conspicuous by their luxuriance and proportions. *Adiantums*, *Davallias*, *Nephrolepis*, and *Microlepias* are other well-grown plants, a fine specimen of *Adiantum Mariessi* being uncommonly good.

In the stoves are large bright specimen *Crotons* (*Codiaeums*) *Warreni*, *Queen Victoria*, *majesticum*, and others, besides a host of smaller ones in greater variety: *Anthurium crystallinum*, *Alocasia metallica*, the flowering *Anthuriums Andreanum* and *A. Ferrieriense* are fine; *Allamandas nobilis* and *magnifica*; *Eucharis*, the beautiful *Davallia fijiensis plumosa*, and *Nephrolepis rufescens tripinnatifidum* were notable. An immense *Musa Cavendishi* grows in one of the stoves, and in the same house overhead wires support many *Nepenthes*, growing and pitching well. *N. Sedeni*, *N. Northiana*, *N. formosa*, *N. mixta* (good), *N. Morgani*, and *N. Rafflesiana* are some varieties grown.

Of Orchids there is a representative collection, embracing *Dendrobies*, *Angræcums*, *Cypripediums*, *Odontoglossums*, *Oncidium*s, and many others, which in their season give useful flowers for cutting, and interesting subjects in a growing state.

In the greenhouses are specimen *Bougainvilleas*, *Statice*s, *Rondeletias*, *Stephanotis* (this grows well under greenhouse treatment, flowering abundantly in summer), and a host of other kindred plants. Very striking, too, were the *Streptocarpus* hybrids growing in 8in pots, the vigorous leaves recurving so that the pots were almost hidden, and the flower spikes proportionate.

Grapes, Peaches, Nectarines, Melons, Cucumbers, and Tomatoes give of their abundance in their season, but at Frenchay, as elsewhere, outdoor crops felt the dire effects of the spring frosts, and prospects for the winter are not so pleasant.

Espalier and pyramid Apples and Pears do well in the red soil of Frenchay, but this year barrenness predominates. Mr. Rye, for more than twenty years, has been a constant and successful exhibitor of both plants and fruit, more than an average share of silver cups, medals, and other valuable prizes bearing credit to his own skill as a cultivator, and the generous interest of Captain Belfield, whom he has so long and so worthily served.—W. S.

**Dendrobium × Venus.**

This handsome and large-flowered hybrid resulted from *D. Falconeri* and *D. nobile*. The stems are long and slender, and of the parts of the flower, the sepals are bright rose at the tips, paler at the bases; the petals are white, tipped with rose, and the lip has a rich maroon blotch, without any yellow in the throat. No *Dendrobium* can stand so much rest as this one, and it must have it, in order to assure its flowering. Sometimes it is rather shy in this respect.

**The Week's Cultural Notes.**

The spikes of *Calanthe Veitchii*, *C. vestita*, and their varieties are now advancing rapidly, and the plants must be so placed that they receive the maximum of light. The leaves are beginning to give way, consequently root action will be very sluggish, and no good purpose will be served by watering at all freely, while manure will also be wasted. Keep the plants well apart, avoid damping the spikes or bulbs, and keep the temperature well up. In a stagnant, cold atmosphere the colour of the flowers will be poor and washy, but give the plants the opposite condition, and there are few more beautiful sights in winter than they.

*Zygopetalum Mackayi* is a winter flowering species that comes in with the *Calanthes*, but requires different treatment. It is evergreen, and forms bulbs and growth at the time the flower spikes are also developing. Here, then, is a case for ample nourishment right up to the time the blossoms open. I have had large, old plants of this species under my care a yard and upwards across, and these seemed able to stand almost aquatic treatment. But it is different with weak and badly rooted — perhaps overpotted — specimens, and I know of few Orchids more difficult to rescue from an unhealthy state, or more easily managed when strong and well established.

A more difficult plant in most hands is *Z. maxillare*, the reason being that it is almost impossible to persuade the roots to enter any compost, no matter how carefully prepared. It thrives best upon a block made of a piece of Tree Fern stem, this being partially sunk in a pot filled with crocks. It is now in flower, and sufficient moisture must be allowed to keep the growth in good condition, while the spikes must not be allowed to remain on long enough to distress the plants. This pretty plant is often kept far too hot, and the cool end of the Cattleya house is quite warm enough for it. In greater heat thrips, its worst insect enemy, attacks it, weakening and eventually killing the plant.

The Butterfly Oncidiums, *O. Kramerianum* and *O. papilio*, are still producing a few flowers, and must be kept warm, and allowed ample light. Remove a little of the sphagnum moss from about the roots if it appears to be holding too much moisture, and cut away a few of the older spikes. Although these would probably flower again if left on, the blossoms will be larger and brighter in colour from the new spikes, these usually pushing in plenty during the early summer months. Remove *Dendrobium chrysanthum* to a warm house after flowering if growths are starting, and keep it gently moving during winter. Just before the new roots appear, *i.e.*, when the growths are about 4 in long, is the most suitable season for repotting.—H. R. R.

**A Talk on Ferns.\***

Considerable care is required in raising Ferns from spores. A shallow pan should be used, half filled with broken pieces of pots, or, better still, with mortar from an old wall, and then filled within one-half inch from the top with fine sifted soil, which should be scalded with boiling water, and drained, before the spores are sown, so as to kill the germs of fungus or insects detrimental to the growth of young Ferns. The spores should be scattered over the surface without covering them with soil. A pane of glass should be put over the pan, and the latter should be placed in a saucer of water, which will keep the soil sufficiently moist. Keep the pan well shaded until the spores are visible as minute plants.

The chances of getting new varieties by intermixing are not very great, but it is the only way to get any at all, except, perhaps, a chance seedling. In selecting the spores care should be exercised to take them from that portion or form of the plant which is most desired. For instance, if a crested form is wanted, the spores of the crested part of the plant should be taken, and the certainty of getting crested seedlings is thereby much increased. The minute plants should be taken up in small patches and pricked off carefully, and when they are established and fit to be handled they should be divided and potted off singly. Plants that have several crowns, or have creeping rhizomes, are easily increased by division. Some species produce small bulbs alone, or at the end of the frond. If those are removed and placed on soil they form plants.

A preparation of soil which suits almost all Ferns is a mixture of two parts of good loam, one part of sharp sand, and one part of leaf mould. The latter is indispensable in raising Ferns to perfection. If the soil does not contain sufficient lime a sprinkling of the same will be found very beneficial. Repot-

ting of Ferns should not be overdone, as it is known that the most luxuriant growth is made when the inside surface of the pot is covered with a network of roots. Ferns like moisture, and the absence of water is shown by the shrivelling of the old fronds.

In herbaceous plants, or plants with woody texture, the young growth wilts first. If the latter stock has been kept too dry the ball can be soaked and the plant will recover; but with Ferns it is quite different, as this treatment has seldom any effect on them, with the exception of a few varieties. Repotting can be safely performed at any time of the year, but the best time in the stove house is in February, and in the cool house in March. In any case it is best to repot before the plants start to make young growth. The pots should be clean and dry, as in any other case the rootlets will

**Dendrobium × Venus.**

stick to the sides of the pots; and if the plants require repotting again, they will suffer greatly, as it will be found impossible to remove them from the old pots without breaking a quantity of live roots. New pots will absorb a great quantity of water; therefore they should be soaked in water and dried again. As the first and second waterings would be absorbed by the pots, the balls will become dry, to the detriment of the plant. Although Ferns need moisture at all times of the year, drainage is most important. In their natural state most of the Ferns grow in partly decayed vegetable matter of a soft texture; therefore they should be potted firm, but not hard.

Moisture, proper atmosphere, and temperature are the most essential; the soil is only of secondary consideration. The ventilation should be managed so that the plants are not in a direct draught; but a close, stuffy atmosphere is more injurious than an excess of ventilation, and more so in the stove

\* By N. Butterbach, before the Monmouth County (N.J.) Horticultural Society.

house. A Fern house should, whenever possible, be built from north to south, and the plants shaded from the strong rays of the sun, although retaining all the natural light possible. Blinds of unbleached muslin, fastened on the inside, under the roof of the house, we have found the best for this purpose.

One of the most useful, and a very old favourite Fern, is *Adiantum cuneatum*, or Maidenhair Fern. It is of easier culture than most any other Fern, and adapts itself to almost any soil and situation. If it is kept moist at the roots it will produce the whole year around an abundance of fronds. It is generally raised from spores, but can be easily propagated by cultivation of the crowns. *A. cuneatum gracillimum* is a variation of the above, and one of the most elegant Ferns. The fronds attain a height of from 1½ ft to 2 ft, and are densely tufted. This variety is reproduced true from spores, and is of very easy culture. *A. formosum* is a strong, handsome greenhouse species, and attains large size. It is very useful for house decoration, and is also of easy culture. It succeeds well in a greenhouse temperature, but if cultivated in stove heat the fronds become much larger, and the plant will make a fine specimen. It is raised from spores and by division of the rhizomes.

*A. Ghiesbreghtii*, or scutum, is supposed to be a variety of *tenerum*. It makes a beautiful plant for decorative and exhibition purposes. *A. peruvianum* is one of the most ornamental stove species of the large growing *Adiantums*. Its graceful fronds are borne on wiry, long stalks from 12 in to 18 in in length, the fronds from 2 ft to 3 ft. *A. tenerum* is a stove species, of elegant habit and very large dimensions. It grows wild in Florida on the river banks, and its fronds are from two to three feet in length. If sufficient room is allowed it, this Fern makes a grand exhibition specimen. *A. cuneatum grandiceps* is highly decorative and robust. It has densely tufted crowns and the fronds are more elongated than in *A. cuneatum*. Its branches are smaller, and the fronds have an arching habit which makes it suitable for hanging baskets. *A. caudatum* is a stove species, different from the majority of *Adiantums*. It is a very useful Fern for baskets, and if suspended, its fronds can be seen drooping two or three feet.

*A. Capillus-Veneris imbricatum* is the handsomest of the *Capillus-Veneris* varieties. The fronds are borne on slender stalks, pendulous, from eight to ten inches long. The appearance of this plant is that of *A. Farleyense*, but it is of dwarfer habit. It is classified as a cool house Fern, but with us it does best with greenhouse treatment. Its graceful cut fronds are used for dinner table decorations, and the plant makes a first-class house Fern. *A. Farleyense*, undoubtedly the handsomest of all Ferns, has attained such a degree of popularity that any description, however complete, would fail to do it justice. It is supposed to be a natural sport of *A. tenerum*; but whatever it may be, it shows admirably the gardener's skill, and draws attention wherever exhibited. Its fronds are gracefully drooping. I have seen plants grown with fronds 2½ to 3 feet in length, and the pinnules, or leaflets, 1½ in broad; and they were grown entirely in pure fibrous loam. They require a temperature of from 70 to 75 degrees at night, and plenty of moisture. Attempts have been made to raise this Fern from spores, but without success, consequently it is propagated by division of the crown.

A very useful Fern for decoration, and a very good house plant, is *Cibotium Schiedei*. Although an arborescent Fern, its trunk never attains a height of over two or three feet when artificially grown. It is of free growth and its fronds are elegantly drooping, measuring sometimes from six to eight feet. In closing, I must not forget to say a good word for another genus of Ferns which demands a space in every greenhouse, however small, viz., the *Nephrolepis*. They are valuable as house plants, for rockwork, decorations and baskets. They are most tenacious of life, and will stand a treatment which no other Fern would.

## Lilium Harrisi in the Flower Border.

It is a common enough experience to find the Japanese *Lilium auratum* purchased for border planting, and a fine object it makes when soil and surroundings agree. It is not so common to see the Easter Lily treated thus, though its claims would seem to be fully deserving. There is something very chaste and aristocratic in the presence of a fine clump of *L. Harrisi* growing and flowering in the garden border, and where this quality is valued and striking objects are a desideratum in the garden landscape, these Lilies ought to invite a passing claim.

We have seen fine bunches of *L. Harrisi* staged among bunches of herbaceous flowers this summer, and in such company their chaste waxen trumpets stand out with conspicuous purity and grandeur. In a growing state this is even more striking. Among beds of *Rhododendrons*, *Azaleas*, and similar shrubs there is a fine opening for these Lilies; and in their

season of blossom, which is August, the lawns and borders come in for a good share of patronage and inspection. They may not probably survive a winter's rigour as will *L. auratum* in *Rhododendron* beds; but they are not so expensive as to make an annual planting prohibitive. Remarks overheard at the flower show when these Lilies were displayed in competitive collections of hardy flowers, convince one that their use as border plants is not quite a common experience.

Usually associated with the greenhouse, and grown in pots, these Lilies are by many regarded as tender and unsuited for any other purpose. Those who doubt the question have only to procure bulbs and plant in springtime in suitable positions, and in suitable soil. Ordinary garden soil enriched with leaf mould and peat will do; but the better the larder the finer results may naturally be expected.

On the chance of their safe passage through the winter in the open, a covering of leaves, as cocoa-fibre, may do much, and for this to be successful the position should be dry. If necessary, they may be forwarded in pots preparatory to their final planting in the open, and by periodic planting it would be possible to keep up a display for some time in positions that would bring them within easy range of inspection. In the herbaceous border they would be in good company.—R. A. W.

## What the Lady Cook has to Say.

"The Man Who Serves the Kitchen" makes out a rather strong case against cooks as a body (page 236), their unreasonableness and general contrariness. Well, cooks are only human, and subject to many infirmities of the flesh and temper, I grant; but yet have they not sometimes cause for complaint? I think so.

The first subject that occurs to me is a great one, that of the Potato. We need supplies, and bountiful supplies, of this vegetable 365 days in the year. It is not a new introduction, and many men have given up their best years to its cultivation and improvement. There are all sorts of Potatoes on the market and in cultivation; first earlies, second earlies, in all their variety, and the main croppers are numberless as the sea sand. And yet (I grieve to say it), I find such difficulty in getting good tubers late in the summer. The earlies are all right, but it is those which come in before the main crop is ready that I find fault with. They are too old to be good, treated as "New," and not mealy enough for the steamer. I grant it is not for long the trouble lasts; but during the time there are constant complaints from the powers that be, and even the servants throw out hints about "pig stuff." Perhaps, indeed, the servants complain before their betters. I do wish all gardeners would make this between-seasons Potato a speciality. No cook can do herself credit with unripe, badly matured stuff.

Then, again, why do gardeners so like to hold over Peas and Beans till they get a "bone" in them? They do detest to gather these things early. Never mind about the first lots being a bit small, let me have them, small if you like, but young, tender, and sweet! I suppose they don't bulk up enough, but that is no concern of the consumer. I often, too, experience a difficulty between Asparagus time and the early Pea. There is a scarcity of good vegetables then, often. For this blank I don't altogether blame the gardener. I know springs are adverse; but still comes the cry from the dining-room, "We should like two dishes of green vegetables, please, cook."

Small stuff, too, for salads, is often bad to come at, and why, oh! why, should the supply of little Onions ever fail? To my mind a salad without Onions is a thing of naught; insipid, flavourless. Could there not be a succession of sowings? But perhaps this is my ignorance.

Horseradish and Salsafy I should like a bit bigger. If only the gardener had to grate the poor, thin roots that come in to the house, he would know! Then why, too, are spring Cauliflowers so often only beautiful miniatures, and why do spring Cabbages take so long to heart? Indeed, they may oftener be classed among summer vegetables rather than spring.

Turnips are much in demand in the kitchen, and though the white are good enough as early varieties (ninety-five per cent. water), I should so prefer for flavour the attractive Swede. These are not so full of fibre and general toughness as their white brethren. Would it ever be possible to have the young Carrots a little sooner? They are so invaluable for soups and hashes; in fact, almost indispensable. I also like a smooth-skinned Artichoke rather than the nobbly variety; there is not so much waste in peeling. My sisters and I have come to stay. We shall make great demands on the gardeners, but we shall also lean to the side of carefulness. We know the value of a vegetable diet, but we also know how to utilise scraps and odds and ends. We shall be no friend to the swill-tub, but at the same time we shall ask for, and expect to get, in our vegetable basket the best of everything.—F.

**Azalea amœna.**

The pretty bush evergreen *Azalea amœna* is one of the best known of all the family. It is so unlike any other; and then, being hardy and evergreen, is so much in its favour, to say nothing of its lovely rose-coloured flowers. But the exact colour depends on situation; sometimes it is almost crimson. In very severe winters the foliage will be a little damaged, but the wood rarely. As soon as the sap rises in spring the flower buds begin to expand, and by May this bush is in its glory when in vigorous condition. As with all *Azaleas*, it stands pruning well, and when it gets old is much improved by being cut well back. And it likes good food, too. Feed it well and prune it occasionally, and vigorous shoots result, which give abundant bloom.

**Spiræa Thunbergi.**

This shrubby Japanese *Spiræa* (which we illustrate on page 337) is undoubtedly one of the finest hardy subjects in every way that are known and grown in British gardens to-day. Perhaps some of our readers who were at the gardeners' dinner noticed the twiggy growths with the green linear leaves that Messrs. Veitch's decorator had used with his flowers. These were growths of this *Spiræa*. Then in spring it is a splendid shrub for forcing, the plants being grown in pots. It is naturally the earliest of all the shrubby *Spiræas* to bloom, and where its beauty is not marred by inclement weather, it is effective and graceful. A light soil and sheltered aspect are what it enjoys. The flowers are white, and the leaves bright green, becoming crimson in autumn.

**The Vitality of Seeds.**

A correspondent writes to the "Evening Standard": About the year 1859 the railway from Ware to Buntingford was in progress—a cutting was being made through a pasture field, when the workmen came on an entirely different soil, which was of a black colour, in which were numerous remains of Roman pottery and some Roman coins. In the following spring there came up a heavy crop of scarlet Poppies for some yards, next to them a crop of Henbane, and further on a crop of Rape, or *Brassica napus*. Nowhere else in the neighbourhood were any of these plants to be met with, not even the Poppies. The seeds must have lain dormant from the time of the Romans, when there had evidently been three plots of ground in cultivation, so sharply and clearly divided were the three crops.

**Culture of Libonia floribunda.**

As a greenhouse plant there are few more worthy of cultivation than the above. Insert the cuttings in March in a 48-pot. They will strike freely in a compost of turfy loam and silver sand, the pots to be placed in a gentle hotbed. When rooted pot singly into three inch pots, using three parts of turfy loam, one part old cow manure, one part silver sand, with some small pieces of charcoal. When established, harden off and grow in a cold frame, shift into "forty-eights" before the roots are matted together, and never let the soil become dry. In September move the plants into the greenhouse, affording them a light position and a temperature of 40 degrees to 45 degrees. The plants will flower freely from January to April, and will not disgrace the dining table or the drawing-room, the small bright green foliage with the orange and dark brown flowers being very effective. After flowering, move them into a temperature of 55 degrees to 60 degrees to make new growth, harden off, then move them outdoors. *Libonias* make nice standard plants. Cut off all side shoots until 18 inches high, then stop as required to make a nice head 18 inches over, which they will do the first season with but little care. Place a plant in the centre of a fruit-stand with fruit round it. Place the stand in the centre of the dining table, and with a good plant of *Gesnera* on each side the effect is most beautiful, especially by gaslight. The *Libonia* will not flower in a high and moist atmosphere.

**Fruit Trees on Dinner Tables.**

To eat fruit fresh from the trees at a banqueting table is one of the latest luxuries of English epicures. Certain fruiterers in the West End (says a London paper) are now making preparations for an abundant supply of dwarf fruit trees laden with Cherries, Peaches, Pears, and Apples for ornament and dessert at the dinners of the coming season. The tiny fruit trees, which, although four or five years old, are only some 3ft. high, not only make a delightful table decoration, but produce delicious dessert.

**The Cedars at Goodwood.**

The death of the Duke of Richmond and Gordon serves to recall the fact that the Sussex seat of the Lennox-Gordon family is "Glorious Goodwood," rich in its mighty trees and broad glades, and, above all, in its unrivalled view of the English Channel. The park at Goodwood is seven miles in circumference, and contains the famous racecourse. It is also remarkable for its wealth of imported acclimatised trees, prominent among which are the Cedars of Lebanon, the Cork tree, and the evergreen Oak. The Cedars of Goodwood were planted in 1762, and are exceedingly well grown for their age, and add greatly to the splendour of this noble park.

**Physalis peruviana edulis.**

One rarely sees a plant of this old greenhouse shrub. At the Norfolk Nurseries, Dereham, there is a specimen planted out at the back of a lean-to house, where it no doubt had been many years, and where it flowers and fruits freely, and Mr. Green stated that the ripe fruits have a considerable attraction for the employer. The flowers are circular, buff yellow, saucer-shaped, and have round the centre five purple spots; the fruit is yellow when ripe, and snugly enclosed in a brown calyx. The plant does well in a greenhouse or vinery, and might be grown with advantage. It is known as the Cape Gooseberry, the common English name come of its popularity at the Cape of Good Hope. It is said that its fruit makes an excellent tart, and what is known as Cape Gooseberry jam is made from them.—R. DEAN.

**To Make Hydrangea Flowers Blue.**

If *Hydrangeas* are grown in a tolerably strong maiden loam which contains a portion of oxide of iron, the flowers will come blue without further trouble; but the plants will require to be potted into this said compost and continually grown in the same from the cutting pot. Watering with a solution of alum for some time previous to flowering will benefit them greatly. The solution may be made by mixing at the rate of one ounce of alum to a gallon of rain water. Plants should be struck from cuttings of the soft wood from February to May that are required to bloom in those months the following year. It is advisable to flower them in seven inch pots, allowing the plants to produce one cluster of flowers, removing side shoots to strike, as the old plants are not to be depended upon to produce blue flowers the second year.

**New Lily, Stephens' Hybrid.**

Mr. F. W. Stephens, of Bermuda, successful grower of true *Harrisi* Lily bulbs, has for several years past been experimenting with seedlings of the best Bermuda grown *Lilium longiflorum*, pollenised from selected *Harrisi*'s, aiming to get a bulb which would retain the health and evenness of the former, while it took on the earliness and freedom of the true *Harrisi* strain. He has this year succeeded in raising two bulbs of fifteen inches circumference, the picture of health, and as much alike as two twins, the product of two four-inch bulblets of last autumn's planting. The scars at the top of stems show that each had thirteen flowers, and by comparing them with the *L. Harrisi* and *L. Doei* (which is the best and earliest *longiflorum* hitherto) it will be seen that they have intermediate characteristics of foliage and bulb. Especially noticeable is the pronouncedly pointed, free, and somewhat twisted petalage of the new bulbs, promising extra early forcing quality. Mr. Stephens will grow the scales of these two bulbs in special ground this coming season, and expects to raise a carefully segregated lot of bulbs true to this new type, which he will in due time exhibit, and, if successful, introduce as Stephens' Hybrid.—PAN (in "American Florist.")

### Pot Culture of Fruit Trees.

The value of this method of cultivating Peaches and Nectarines cannot be over-estimated. In establishments where the demand for fruit is large, and where fruit houses are limited, pot culture of fruit trees should specially recommend itself. Houses that are occupied with fruit trees in summer may during the winter be filled with Chrysanthemums, Azaleas, bedding stuffs, or other plants that need protection.

There can be no doubt that from trees trained on trellises occupying a whole, or part, of a house we get a good supply of fine fruit, but it has this disadvantage, that too many fruits are ripe at the same time, and must of necessity be gathered and used immediately, as, unlike Grapes, they will not hang until required; consequently, there is for a time an over-abundance, and then none at all. Now, with trees grown in pots, this would not happen, for where we grow one tree on a trellis we can grow half a dozen or more in pots, in one or more varieties, and in different stages of growth; and instead of one tree and a supply of fruit of short duration, we have several trees giving us a prolonged supply, in sufficient quantities to be easily disposed of. This is an advantage of considerable importance where a long supply of fruit is required.

In commencing the culture of fruit trees in pots, it is better to begin with trees specially prepared for the purpose. The pyramid is the form of tree best adapted for this method of culture; but where there are lofty houses standards or half-standards may be used if desired. Whichever form is decided on, trees of a fruiting size should be obtained; by so doing much time will be saved.

When the trees arrive from the nursery it will be necessary to repot them; shake away some of the old soil, and cut off all suckers; drain the pots thoroughly, and use good turfy loam, to which may be added some lime rubble, wood ashes, and a little bonemeal; pot firmly, and leave a space of a few inches on the top for a summer dressing. When completed stand outside with a slate under each pot to keep out the worms. To prevent breakage by frost cover the pots with ashes or some other suitable material.

Before forcing operations commence, the heads of the trees should be overhauled and the necessary pruning done; very little will be needed if disbudding has been properly attended to, other than shortening long or unripened shoots, shortening being advisable for pot grown trees. The time for moving the early ones inside will depend on the time the fruit is required; but six or seven months should be allowed from starting to finish. When the trees are in bloom assist them to set their fruits by keeping the house dry and airy, and by a daily use of the camel-hair brush upon the flowers. As the late varieties show signs of expanding flowers they must be placed under shelter; but when the fruit is set, and all fear of frost past, they may be stood in some sunny spot outside. This will have a tendency to still further retard them; they must, however, be placed inside again as they show signs of ripening, or as the early ones are brought out.

During summer, when the trees are growing fast and swelling fruit, they must have an abundant supply of water, or disappointment and failure will be the result. Further, having only limited root space, feeding should commence early, and be continued until the fruits commence to ripen. A top-dressing of rich loam and horse droppings may be given in space left at potting time, when the fruits are about an inch in diameter. When the roots have taken possession of this, manure water from the cow sheds, dissolved bones, and other fertilisers may be used alternately with clear water with good results.

As the leaves turn yellow and begin to fall off, repot any that need it, though this will hardly be necessary more than once in two years, or remove a few inches of surface soil and top-dress with the material as advised for potting. This will destroy some fibrous roots, but that is of little consequence. The same sized pots will do for a number of years, and large crops of good flavoured fruits may be obtained for five or six months out of the twelve.—P.

### Pines.

**PLANTS SHOWING FRUIT.**—These will be valuable when the fruit is scarce and dear, therefore afford such plants the best positions in the fruiting department. Maintain a temperature of 70deg at night, 75deg artificially by day, up to 85deg to 90deg with sun, closing at 85deg, sprinkling the paths when their sur-

face becomes dry, and occasionally the plants on fine afternoons. Keep the bottom heat steady at 85deg to 90deg. Examine the plants once a week for watering, and if any require it afford a supply of clear liquid manure at about the same temperature as that of the beds. Care must be taken not to overwater the fruited, as that has a tendency to cause the fruit, when cut, to be black at the centre.

**PLANTS TO FRUIT EARLY.**—Queens are the best for this purpose, but there is not always a certainty of their doing so unless they are given a period of comparative rest after making good growth. Plants intended for starting at the new year should be kept in a temperature of about 65deg in the daytime by artificial means, 60deg at night, ventilating at 70deg, closing at that, and allowing the bottom heat to fall to 70deg to 75deg. Water the plants only when necessary, but do not allow them to become so dry as to cause the foliage to become limp.

**YOUNG PLANTS.**—All young stock should now be arranged so as to obtain the fullest benefit of light and air. As the sun diminishes a corresponding diminution of temperature must take place at night, until it reaches the winter standard of 55deg to 60deg at night, and 65deg in the daytime. Ventilate freely whenever conditions are favourable, paying particular attention to watering. Examine plants about once a week, and whenever one needs water give it copiously at about the same temperature as the bed.—PRACTICE.

### The Loganberry.

This will become one of the indispensable fruits of the near future. Already it is found in almost every garden, and in noble estates it has been cultivated beyond the tentative stage, till at last breadths of it are being added in suitable places, and generally with great success. Beyond the fact that the fruits (of which Mr. Geo. Shayler's drawing is a life-size representation) are pleasant to eat as taken from the bushes, the robust growth and leafage of the plant is ornamental, either on walls, palings, or trellises. The Loganberry can be grown similarly to Raspberries, though we believe a lighter soil, or one of richer but more porous texture than Raspberries do well on, is helpful to its establishment.

The ruddy-brown calyces are characteristic features of the summer's earlier growth. Messrs. J. Veitch and Sons, Ltd., of Chelsea, received a First Class Certificate this year for their samples of this novelty, but it is in the hands of the entire trade—all the nurserymen—so that stock is easily secured. The fruits are nearly black in colour, with a flavour "slightly more acid than a Blackberry," and with a faint Mulberry addition.

### Raspberry Culture.

The Raspberry is usually propagated from suckers; these are taken up and planted in November. The ones found growing at some distance from the parent plant are the best for the purpose, as they generally lift with an abundance of fibrous roots. Almost any situation seems to suit Raspberries, but the finest fruits are produced on plants grown on an open piece of ground. The plot of ground upon which it is intended to form a plantation should, before planting, be well trenched, and plenty of well decayed manure incorporated with the soil. Firm planting is necessary.

The arrangement of the plants depends a great deal upon circumstances. One method is to plant three bushes together in the form of a triangle, the whole being supported by a stout stake. The rows should be 5ft apart, and 3ft between each group. This is a serviceable arrangement where space is limited. Another system, and the one most generally adopted in private gardens, is the espalier system. Wires are run the desired length, supported at each end and at intervals along the length by iron posts. The distance between the rows should be five or six feet, and allow two feet between the plants. For the dwarf-growing varieties, four feet between the rows will be sufficient.

It is the practice of some growers to prune the young canes immediately after planting. This operation, however, is best left until February, just as the plants are beginning to move.

**ESTABLISHED PLANTATIONS.**—So soon as the fruit crop is over cut out the old fruiting canes and tie in loosely the young canes to prevent them being broken down; remove all weakly shoots, and leave five or six canes to each stool. When the leaves have fallen, shorten back the canes to about 5ft, and tie them securely to the supports. Clear all rubbish away, and apply a top-dressing of well-decayed manure, to which has been added some wood ashes. Beyond keeping the ground clear from weeds and suckers, little attention will be required until May, when another top-dressing may be applied. During the growing and fruiting seasons plantations on a light soil will need frequent waterings. Manure water may be applied with beneficial effect as soon as the fruits are set.

**LATE FRUITS.**—If space permits, a few canes of autumn fruiting varieties should be planted. The treatment is similar to the earlier varieties, with the exception of the pruning. Cut the canes right down in January or February, and thin out the shoots as soon as they can be handled, retaining only the most vigorous. The fruit will be produced at the top of these shoots in the autumn.—G. R., Waddesdon.

## Lightning and Trees and Plants.

It is a matter of individual opinion, and, as such, must therefore be taken for what it may be worth; but my personal belief is that the forecasts of the weather, which appear in so many newspapers, if they have advantages, have also their objectionable side. People are led by these to study the weather too much, and, as a consequence, they attribute various aches and ills to its influence, with which it has little or nothing to do, and trouble themselves about atmospheric changes, which seldom come when they expect them.

Speaking generally, it is the idlers who are the weather students, but gardeners must be excused for being somewhat observant of its moods. Their successes and failures are largely dependent upon it; their occupation has to be carried on, at times, under watery influences by no means cheering, though during such showers as we had last July both the gardener and the field labourer are obliged to pull up for a while. We hear occasionally of field labourers being injured in a thunder-storm, seldom of gardeners; the reason is obvious. On a field persons are more likely to become marks for the electric current than in a garden, where chimneys may not be far distant, and probably a variety of shrubs or trees are growing about. Indeed, though many would not think so, a wood is one of the safest places to be in during a storm, if it has no very tall trees.

It has long been a subject for speculation, and will continue to be, whether, under one species of tree, we are exposed to more peril than under another; but we have ceased to believe in a curious idea which had prevalence centuries ago. So far as we can judge, its origin was in the East; but it was imported to these Western countries. Various trees and plants had the repute of being accumulators or resting places of lightning; they received it from the sky, and could send it forth again. To the lively imagination of the ancients lightning was not an electric current; it appeared to be a worm, a fiery serpent, an arrow, or a forked wand; a flower or leaf might be its symbol, and its receptacle a tree. Amongst those named are the Ash, Hazel, Whitethorn, and that mystic plant the Mistletoe. Even some birds, such as the woodpecker, were thought to be connected with lightning.

Hindoos of the present day attribute extraordinary virtues to a Mimosa, which is one of the lightning trees; it has the power of curing diseases, and is an especial protection against the dreaded influence of the "evil eye." Another tree connected with the celestial fire is called the "Palusa"; it has a red sap, and scarlet blossoms, therefore by its appearance suggestive of flames.

The Mountain Ash, familiar to us in Britain, is one of the trees presumed to be a receiver of lightning or owing its origin to the current. From the brilliancy of its scarlet berries this tree came to be regarded with admiration, mixed with awe, even by those who did not look upon it as a lightning species. To this hour, in the Scotch Highlands, a cross of Rowan is carried by maidens to protect them against unseen dangers. Germans fix a twig above the door of a house for good luck.

Not a tree is it casting much shade, but how would it be to stand near the Rowan during a storm? Well, there seems to have been a difference of opinion about the dangerous nature of lightning plants: people did not shun the Rowan, but they were afraid of the common Ash.

There was a saying, "Avoid the Ash, it counts the flash"; yet we might have thought the strength of its wood rather a safeguard against serious injury from the electric current. Frequently the Ash is seen growing in positions where it is much exposed to the weather. In passing, we notice the fact that few plants flourish under the shade of this tree; the reason must be, we presume, an effect arising from its drip. This would mean that the rain carries down something in solution from branches or leaves, possibly of an astringent nature.

Sacred both to Pagans and Christians was the Hazel, a tree of many virtues, also a lightning plant; some believed it to be a product of the sky. Yet it was not thought perilous to approach it in a storm; indeed, the Christian legend accounting for its sacredness was that while en route for Egypt, the Holy

Family found temporary shelter under a Hazel. By the old Pagan belief this tree was one specially dedicated to the deity Thor. In some parts of the Continent a twig is cut when it is leafing, and on the first thunder shower a cross is made with it over corn in granaries, the supposition being that this will preserve the grain from mould or insects. A bit of Hazel put inside the window-sill was supposed to prevent the entry of lightning into a house.

One odd fancy about the tree was that a profusion of its nuts indicated the approaching arrival of a large number of infants! Then the Whitethorn, Hawthorn, or May tree has also a place amongst the lightning species. Before the Christian Era the Greeks and Romans regarded this tree with reverence, and by both nations its flowers and leaves figured conspicuously in the marriage ceremonial. One cause for the Christian regard it received was the tradition that

from its branches Christ's crown of thorns was made. Yet there was a general objection to bringing branches of Hawthorn into dwelling-houses; but people stuck them over the doorways during May.

The Oak, associated with fairyland and a host of legends, had also the repute of a lightning origin, and it was a serious thing to fell one of these trees of ancient date, unless a strong reason existed. But, though a sacred tree, it had no immunity from the lightning flash, and persons have often been struck when standing beneath an Oak. This has occurred sometimes through Oaks standing solitary, being planted as landmarks at the borders of estates. It has been suggested that the Oak is more frequently struck by lightning than other trees, because it is apt to be gnarled and twisted with numerous projections on its trunk. The comparative immunity of the Beech, again, has been attributed to the fact that its trunk is smooth, offering no points of attraction. Indeed, an effort was made by some to prove the Beech is never struck by lightning; but there have been undeniable cases.

The Mistletoe, always highly revered, but particularly sacred when growing upon an Oak, was supposed to be an embodiment of the lightning, and its forked branches had a significance to many, "Thunder-besom" being one of its names. Like

The Loganberry, natural size.

other lightning plants, its potency varied. When brought into houses, Mistletoe was believed to give protection against fire; also it kept off nightmare or evil dreams if placed at the bedside.

According to tradition, the plant was propagated by birds that were the messengers of the gods, and they carried the seeds in their bills to deposit them upon branches of trees that were suitable for their growth. Special repute attached to the mistle thrush; also, it seems, to the woodpecker. It was thought dangerous to cut the plant off Oak or Hazel. From its being a plant of the gods, Mistletoe was reputed to cure fits and other diseases; also it stopped the effect of poisons.

Then the so-called Springwort was a lightning plant full of mystic powers; but it was not easy to find, and now its identification is doubtful. Only we know that it was a low growing plant. For some reason or other Grimm thought this was a species of Spurge, the Caper, or Euphorbia lathyris; it has a crimson stem. Actually, it is a very poisonous plant, and great harm has been done by its rash administration internally. One idea about it was that if a portion of the plant was buried in a hole upon a hill, a storm coming over that hill would be divided and soon dispersed. The Westphalian folk gather our Orpine, or Live-long, as a preservative against the stroke of lightning. In some countries the St. John's Wort is believed to be effective; but they must be plucked before sunrise. Stonecrop and Houseleek were grown upon roofs on the supposition they gave protection to the abode.—J. R. S. C.

## Colours in Foliage and Flowers.

All who are accustomed to observe vegetation must have been struck with the great variety of shades of green which the foliage of different plants presents. It may also be noticed that the same description of plant will exhibit very characteristic differences, not only at different stages of growth, but at the same stage, in different conditions of luxuriance, as affected by the external conditions of soil, season, and manuring; but especially under the influence of different conditions of manuring.

From some researches made at the Rothamsted Experimental Station on this subject, it was found that the green chlorophyll formation in plants has a close connection with the amount of nitrogen assimilated, but that the carbon assimilated is not in proportion to the chlorophyll formed. Further, it has been found that the presence in the soil of certain mineral or ash constituents of plants, and especially of potash, is essential for the assimilation of carbon, no starch being formed in the grains of chlorophyll without the aid of the element potash.

In regard to the colours of flowers, it has been found by Dr. Hansen that there are three distinct pigments which make up the different tints, in addition to chlorophyll, which forms the green colouring matter in the stems and foliage of all plants. These colours are yellows, reds, and blues.

The yellows are mostly in combination with the plasmic sap, while the others exist chiefly in solution in the cell sap. The yellow pigment forms an insoluble compound with fatty matters, and is termed lipochrome.

Orange is formed by a denser deposit of yellow, and the colour in the rind of an Orange is identical with that found in many flowers. The red in flowers is a single pigment, soluble in water, and decolourised by alcohol, but capable of being restored by the addition of acids.

Lipochrome, combined with this red pigment, produces the scarlets and reds of Poppies, and the heps of Roses and Hawthorns; but the varying intensity of reds in Roses, Carnations, and Pæonies, and other flowers, depends on the presence of a greater or lesser quantity of acids in the soil or in the manure employed. This may be one of the reasons why superphosphate of lime, which is always more or less acid, forms such an excellent manure in the growth of most flowering plants.

The blue and violet colours are also decolourised by alcohol, but are reddened by acid solutions. Florists have already succeeded in producing many unusual colours in flowers, and there seem to be very good grounds for believing that it is possible so to manipulate Nature by means of chemical manurial agents that she will produce blossoms of every conceivable tint and hue.—J. J. WILLIS, Harpenden.

REMARKABLE APPLE TREE.—A correspondent has written to the editor of the "Daily Express" as follows: "I have an Apple tree with three crops of Apples and bloom at the same time. It has the first and ordinary fruit; then, having bloomed again, there is a crop of Apples about the size of bantams' eggs; once more it bloomed, and there is now a third crop with fruit about the size of a marble. Since then it has bloomed again."

## NOTES & NOTICES

### Royal Horticultural Society.

The next fruit and flower show of the Royal Horticultural Society will be held on Tuesday, October 13, in the Drill Hall, Buckingham Gate, Westminster, 1 to 5 p.m. A lecture on "Autumn Strawberries and Raspberries" will be given by Mr. Jas. Hudson, V.M.H., at 3 o'clock.

### Mr. and Mrs. D. P. Laird's Silver Wedding.

Mr. and Mrs. David Pringle Laird, Pinkhill, Murrayfield, have just been presented with a handsome silver lamp on the occasion of their silver wedding, by the employés of R. B. Laird and Sons, Ltd., nurserymen, Edinburgh. The presentation was made by the oldest employee, Wm. Deas, Mr. Laird very suitably replying. Mr. and Mrs. D. P. Laird were married at Truro, Nova Scotia, on September 30, 1878.

### Annual Dinner of the "Provident" Society.

The seventeenth anniversary dinner will be held at the Holborn Restaurant, High Holborn (Royal Venetian Chamber), on Tuesday, October 27, 1903, at 6.30 p.m. Peter Barr, Esq., V.M.H., has kindly consented to preside. The secretary will be glad to know, not later than Saturday, October 24, the names of persons attending. Tickets 5s. each; morning dress.—W. COLLINS, Secretary, 9, Martindale Road, Balham, S.W.

### Beckenham Gardeners.

The Library Committee forward a copy of the syllabus of lectures for the coming winter session. The library and reading-room at the Church House is open every Friday evening, October to March (inclusive). There are over two hundred members, by whom books may be borrowed on application. All the lectures are public and free. The new syllabus is very varied and of a high order of merit as regards the subjects.—MARK WEBSTER, The Gardens, Kelsey Park, Beckenham.

### Ipswich Gardeners' Society.

The third session (1903) has begun, and the following are the papers read or to be read:—October 1, Culture of Apples and Pears and their commercial importance, Mr. W. Seabrook, fruit grower, Springfield, Chelmsford; October 15, The Evolution of a Flower, lantern lecture, illustrated by micro photos from nature, Mr. A. Martinelli, St. John's Road, Ipswich; November 5, Pollination and Fertilization of a Flower, Mr. E. Creek, Westerfield House Gardens; November 19, Discussion, Chrysanthemums, &c., December 3, the Judging of Horticultural Exhibits, &c., Mr. W. Messenger, Woolverstone Park Gardens; December 17, The Carnation, its types, culture, and uses, Mr. R. Dean, V.M.H., Ranelagh Road, Ealing.

### Second Crops of Plums and Strawberries.

The year 1903 will be remembered by fruit growers and market gardeners as one of the most remarkable they have known. In the fertile Vale of Evesham a mild February brought a fine show of blossom on the fruit trees, but there were disastrous frosts in May, and the Plum crop was a failure. Pershore Plums, which in prolific years have sold for a shilling a pot (of 72lb), made this year from ten shillings to over a sovereign. Last week Damsons were sold in Evesham for 42s. the pot. This month, however, there are more Plums to be seen in the plantations than during June. This is due to a heavy second crop. Naturally, the fruit is not so well grown, and the flavour is not so good, but both Victorias and Pershores are making more money than the first crop sometimes does. There is also a second crop of Strawberries and Raspberries, while Blackberries are very plentiful, and are being bought by the jam boilers. Apples and Pears (says the "Daily Mail") have been a great failure in the Evesham district, and the vegetable crops were hardly up to average. Further evidences of the eccentricities of the season come from other quarters. A second crop of Plums has been gathered at Dedworth, near Windsor, and ripe Strawberries at Kingsclere, Hants, and various parts of Devonshire.

**Appointments.**

Charles Névil, as head gardener to Major Grant, Bishop's Hill, Walton-on-Thames. \* \* Mr. Henry C. Durnford, as head gardener to R. M. Caulfield, Esq., Broadhanger, Petersfield, Hants. \* \* Mr. George Gregory, as head gardener to G. H. Taylor Whitehead, Esq., Compton Castle, North Cadbury, Bath.

**Temple House Gardens, Great Marlow, Bucks.**

The register of rainfall here for September, 1903, was 2.49in, and for September, 1902, 1.15in. During the month of September, 1903, rain fell on sixteen days. We had thunder on the 4th, a hailstorm on the 11th, a very rough gale on the 10th (when several large trees and branches were blown down), and foggy mornings on the 13th, 17th, 22nd, 23rd, 24th, and 27th. The maximum temperature for September, 1903, was 82deg on the 2nd; and the minimum 35deg on the 16th. The maximum for September, 1902, was 72deg on the 1st; and the minimum 34deg on the 18th.—G. G.

**Sussex Weather (September).**

The total rainfall at Abbot's Leigh, Hayward's Heath, for the past month was 3.41 inches, being 0.64in above the average. The heaviest fall was 0.83in on the 10th. Rain fell on fourteen days. Total rain for the nine months 28.25in, which is about 8in above the average. The maximum temperature was 77deg on the 1st and 2nd; the minimum, 35deg, on the 17th: mean maximum, 66.14; mean minimum, 48.16; mean temperature 57.15deg, which is a little above the average. The dull, showery weather which prevailed during August continued to the 12th of this month. From then to the 21st, we had it colder, but dry and brighter on several days; but since the latter date we have had rain on six days to the amount of 1½in. It is, however, warmer, and green crops are making better progress than they were doing.—R. I.

**September Weather at Belvoir Castle.**

The prevailing direction of the wind was S.W., total 7 days. The total rainfall was 2.98in, this fell on 19 days, and is 0.66in above the average for the month; the greatest daily fall was 1.10in on the 10th. Barometer (corrected and reduced) highest reading 30.546in on the 15th at 9 a.m.; lowest 28.922in on the 10th at 9 p.m. Thermometer: highest in the shade 73deg on the 1st; lowest 35deg on the 17th; mean of daily maxima 63.70; mean of daily minima 47.53; mean temperature of the month 55.61deg; lowest on the grass 31deg on the 17th; highest in the sun 127deg on the 1st; mean temperature of the earth at 3ft 55.26deg. Total sunshine, 152 hours 55 minutes, which is 1 hour 35 minutes below the average; there was one sunless day. The above mean temperatures are again much below the average. The total rainfall for the nine months ending September is almost 3in above the average.—W. H. DIVERS.

**Paper on Apple and Pear Culture.**

The winter session of the Ipswich Mutual Improvement Society commenced on Thursday, October 1, and in spite of the unpropitious weather a goodly muster of members heard the paper on "Apples and Pears," read by Mr. Seabrook, of Springfield, Chelmsford. Mr. Youngman, of Charsfield, occupied the chair. In introducing his subject, Mr. Seabrook referred to the large imports of fruit, which he considered might be produced at home. He strongly advised intending planters not to take up too much land at the start, but rather to sink all their money in a small holding, planting bush trees and small fruits, in preference to covering a large area with standard trees. Orchards upon grass came in for particular condemnation, the returns in the essayist's opinion being considerably inferior to those obtained from land under cultivation. In conclusion, Mr. Seabrook gave a selection of Apples and Pears, which flourished with him, and invited the members' discussion of the subject. This was taken up with vigour by the chairman, Messrs. Notcutt, Cotton, A. Creek, Whittel, Rush, and others. Mr. Seabrook was accorded a hearty vote of thanks on the proposition of Mr. Notcutt, seconded by Mr. A. Creek. Several interesting exhibits were staged for inspection. Frewer Bros., Stowmarket, sent about four dozen large blooms of Show, Fancy, and Cactus Dahlias, including several new varieties. Mr. James showed some heavy clusters of Tomatoes, and Mr. Whittel brought some nice plants of *Kochia scopiaria* in small pots.—E. G.

**Death of Mr. William Plant.**

Mr. William Plant, of Timperley, Manchester, a well-known horticulturist, died recently from an apoplectic fit. Though a native of Northwich, much of his life was passed in the Timperley district. After serving as lecturer on horticulture to the Cheshire County Council, he began business as a florist at Broadheath, and it was chiefly through his efforts that the Altrincham and District Gardeners' Improvement Society, of which for some time he was chairman, sprang into existence. As one of the old members of the Manchester Botanists' Society he was an intimate friend of the late Mr. Thomas Rogers, and of the late Mr. James Percival, of Smithy Bridge.

**New Head Gardener for Birmingham Parks.**

The Baths and Parks Committee of Birmingham has appointed Mr. William H. Morter to the post of head gardener (or chief park keeper) of the Birmingham City Parks, rendered vacant by the retirement of Mr. Samuel Hearn, after thirty years' continuous service with the Corporation. Mr. Morter has had a very large and varied experience in the treatment and laying out of ornamental flower gardens, the construction of lakes, and the formation and drainage of walks, carriage drives, &c.; also in the maintenance of turf land, the cultivation of shrubs, and the planting of various trees on the estate of Lord Avebury, at High Elms, Farnborough, where he has been employed as head gardener during the past eleven years. It is expected that he will take up his new duties on the 1st of November next. He has been appointed at a salary of £180 per annum.

**New Head Gardener at Hopetoun House.**

The important appointment of head gardener to the Marquis of Linlithgow at Hopetoun House, South Queensferry, has been conferred on Mr. Thos. Hay, son of Mr. Robert Hay, South Castle Street, Cullen. Mr. Hay served his apprenticeship under Mr. Brander, Duff House, Banff, after which he went south. He was at Terregles Castle, Dumfries, for three years. An opening as foreman occurred at Hopetoun Gardens, when under Mr. Smith he was chosen, and gained favour by his constant application and study of floriculture. The head gardener having been head gardener. At the wish of the Marchioness, Mr. Hay to take by degrees a more responsible share of the duties, and these have been carried out in such a way as to gain the confidence of the proprietor, who has given him the entire charge as head gardener. At the wish of the Marchioness, Mr. Hay, recently made a tour through England visiting a number of high-class gardens, and making himself acquainted with the most recent modes of culture, and otherwise qualifying for this important position of trust.—("Banffshire Advertiser.")

**South-Eastern Agricultural College, Wye, Kent.**

The South-Eastern Agricultural College, Wye, commenced its tenth session on September 25. Seventy-seven students are in residence, this number being an increase of twenty-two on the number at the commencement of last session. The equipment of the college has been improved by the addition of a carpenters' shop and of an ironwork shop, fitted with lathe, and three hearths for farriery and other forge work. A forestry department is also in course of establishment, additional land having been taken for the purpose. The college Hop-garden fortunately escaped the full severity of the recent gales, and gave a yield of 13cwt per acre of very fair quality Hops. Through the instrumentality of Mr. Edwin Ellis, one of the Surrey governors of the college, a Southdown flock has been established, thirty-three ewes and a ram having been presented by the following well-known breeders:—The Dukes of Devonshire and Northumberland, the Hon. H. Cubitt, Messrs. Brassey, Cosmo Bonsor, Coleman, Czarnikow; E. Ellis, Plumpton; whilst Mr. Ellis has also lent a ram from his successful flock. The thanks of the college and all connected with it are gratefully accorded to all these donors for their generosity and public spirit. It is intended to maintain the Kent flock as well, and to carry out experiments on cross-breeding. The equipment of the farm has also been improved by the erection of a range of breeding styes for housing ten sows of different breeds; whilst bullocks of different breeds are being fed this winter, all these trials being carried on for the information and benefits of the students.

### Cultural Notes.

Plants growing to produce large blooms, whether for exhibition or home decoration, should now be under cover, except in the case of those intended for very late blooms. Plants developing early buds cannot be retarded out of doors after they show the colour of their petals; therefore it is better to take them inside and have the benefit of the flowers, as moisture on the buds, no matter whether it be from rain or heavy dews, quickly causes the petals to decay.

Plants intended for extra late blooms still out of doors should have some slight protection at night in the case of frost, as this is likely at any time now. Frost upon the buds quickly injures the calyx, thus preventing perfect development of the florets. The smaller the buds the more easily are they affected. Light tiffany stretched on poles will ward off several degrees of frost; in fact, all that may reasonably be expected for some time yet. Plants under cover must have abundance of air; a too sudden change from outside conditions to a warm greenhouse, for example, cannot be an advantage to the plants. If the weather keeps warm and dry, an occasional syringing of the foliage will be an advantage, say once a day.

### MILDEW AND RUST.

If the plants show signs of rust or mildew, they, of course, should not be syringed; quite a dry, buoyant atmosphere is what is best in that case. Mildew upon the leaves in serious quantity should be got rid of as quickly as possible, or the leaves will fall off the plants prematurely, and that would be injurious. A plentiful supply of foliage assists the development of the blooms, not only in size, but in the quality and solidity of the florets as well. A slight attack of mildew may be met with dusting the leaves with sulphur; that of a brown colour is best. It is quite as efficacious, and has not the objectionable colour of the ordinary.

It is not enough to apply the sulphur to the surface of the leaves only; the underneath side should be dusted also. A pair of Malbec bellows is the easiest means of applying the sulphur. In a case of bad attack more drastic measures should be taken to rid the plants of this fungus. The most effective method of ridding the plants is the following. Lay the plants on their sides, syringing them, thoroughly wetting every part with the following mixture: Place 2lb sulphur and 2lb lime, which has not been slaked, in ten quarts of water, and boil for twenty minutes.

For syringing on the plants use two wineglassfuls of the mixture to four gallons of clean, cold water. A syringe with the jet affixed, causing a single stream, is the best method of applying the liquid; by placing the forefinger over the orifice the liquid can be directed upwards and spread over the plant, where required. If a slight discolouration of the leaves follows from the sediment of the mixture, it will not be injurious, but can be removed if desired by a vigorous washing with clean water.

### HOUSING.

Ample space should be given the plants; overcrowding is a great mistake. Far better grow fewer plants than spoil all. The foliage must be retained until the blooms are half developed, at any rate; longer if possible. Abundance of light overhead is an absolute necessity, or weak peduncles will be the result, and how can good blooms be expected through weakened flower stalks? Too often the plants have to be crowded into vineries or Peach houses, where at times, owing to an existing crop of fruit, as much light cannot be given the Chrysanthemums as is desirable.

If the crop has been removed from the Vines there is no harm in cutting back the shoots coming from the spurs to within a foot of their base, provided the Vines are in a proper ripened condition. Vineries facing south with a tolerably high roof afford a capital site for Chrysanthemums, arranged in bank-like form to face the path, which usually runs parallel to the back wall. Here the plants obtain ample light as the leaves fall from the Vines; if these latter are early varieties, so much the better.

The aspect which the Chrysanthemums occupy dispenses with the necessity for shade for the plants. This is a convenient manner, too, in attending to the plants, and produces a capital effect when in bloom.

As previously stated, abundance of air night and day is

an absolute necessity, especially at first. Extra care will be needed in supplying the plants with water at the root. Whereas the soil required watering twice daily when the plants were outside, they may not require it once a day now.

### FEEDING.

By no means allow the plants to suffer for want of it. Whatever is needed, give it in the morning, so that surplus moisture will be dissipated before night, as the air can then be kept in more buoyant condition. Stimulative food should be regularly given; in fact, every time the plants require water, provided, of course, whatever is given is not too strong. Liquid from sheep, cow, or deer droppings, with a little soot added, cannot be excelled as a stimulant. A change to Clay's fertiliser, Standen's or Thomson's manure will be beneficial.

Backward plants may be hastened by giving them a pinch of nitrate of soda once, powdering it finely, sprinkling it over the surface, and watering in at once. Plants that exhibit a lack of chlorophyll, or colouring matter, in the leaves may be improved by a judicious use of sulphate of ammonia. Plants that have not an abundance of roots should not have this chemical. Dissolve one tablespoonful in four gallons of weak liquid manure, and apply it to the plants once a week. Some growers sprinkle the ammonia on the surface of the soil, and water it in; but this, I hold, is dangerous to the surface roots. These should be encouraged in every way, as they are the main feeders of the plants.

Some growers advise that feeding be discontinued as soon as the bloom buds show colour; but in my opinion that is just when assistance is required to develop the blooms. Continue to feed the plants until the blooms are three-parts expanded. I need hardly say that weak growing sorts should not be fed so often, nor with so strong a stimulant, as the more vigorous.

### INSECT PESTS.

Insect pests, especially earwigs and snails, must be closely watched for and destroyed, as both of these are strong enemies. In addition to trapping the earwigs in the usual way with Bean stems, lengths of Bamboo cane and rolls of cloth thrust amongst the foliage, carefully examining them every morning, they must be searched for by artificial light when they are at work upon the succulent florets. The least shake of the plants disturbs the insects; quietly search for them with a lamp, and pick them off with a pair of steel tweezers. Slugs and snails quickly play havoc with blooms, especially the incurved sorts, which seem to have an especial temptation for large brown snails. Directly their presence is detected by the slime they leave on the plants, pots, or walls, rest assured they will come again.

The best trap is a handful of bran sprinkled on the pots or floor. To this they quickly resort, when they should be caught at night. See that all peduncles of a weak nature have sufficient support to prevent snapping off by their own weight as the flowers expand.—E. MOLYNEUX.

### Four Good Chrysanthemums.

The quartette of flowers named and figured on page 333 are found in the front rank of exhibitors' collections in this year of grace, and they have been duly respected since first they became known a few years since. As varieties they are each distinctive, and they possess the grand merit of vigorous constitutions. Beyond this there is nothing one need say further in their praise, and if any of our readers have cultural hints they can add beyond what we have published heretofore, pray let them pen a note. But we extend the invitation to Chrysanthemums in general, for the reign of the Autumn Queen has begun, and the chroniclers should keep apace.

### Securing Terminal Buds.

The majority of the buds it is possible to select now are those known as terminals. Many varieties produce the best flowers on these buds, while others will only produce them small and late. Plants for decoration and cutting from are almost invariably grown with terminal buds, size of bloom not being so important as good colour, quantity, and form. Abundance of flowers can also be secured, but it is usually best to regulate the number by partial disbudding. If the largest possible blooms must be secured on terminal buds, the disbudding of the side buds must be commenced early, the central bud in the cluster then swelling and developing to a large size.

Shoots bearing several flowers are appreciated for cutting as sprays, as well as for remaining on the plants, which serve as decorative specimens in groups in greenhouses, conservatories, or verandahs. More formal specimens trained and tied with the blooms equidistant must be confined to single flowers on each shoot.

### ENEMIES.

The most troublesome insects to Chrysanthemums after housing are earwigs, and sometimes green fly makes its appearance. Traps should be set for the former, these consisting of folded strips of brown paper placed among the plants, or small pots half-filled with hay inverted on sticks. Another good trap

is hollow Bean stalks, into which the insects crawl and hide. Blow them out every morning and kill. The green fly is readily destroyed by vaporising the structure soon after the first housing. More insidious, and more difficult of eradication, are fungoid enemies, mildew and rust. It is a good plan to syringe the plants before housing with sulphide of potassium at the rate of 3oz to 2gals of water. Repeat this on two or three occasions for rust. One application will probably destroy mildew. Very badly infected leaves should be picked off and burnt. Caterpillars sometimes prove troublesome, and may soon destroy many petals in a flower if not searched for, caught, and destroyed.—E. D. S.

present arrangement with the Crystal Palace Company is fortunately only for this year. Mr. Geo. Caselton, the garden superintendent at the Palace, greatly assisted with his staff in arranging the show, and Mr. R. Dean seemed fresher than he has lately done.

It is of interest to know that there are 130 societies in affiliation with the "National"; and the number of members on the books is 645. The financial position of the society is satisfactory, the balance in hand at the end of last year being £68 9s. 6d. Ever and again, however, one hears mournful murmurs to the effect that the N.C.S. is not flourishing—is, in fact, on the downward grade. That it is not flourishing (i.e.,

### Chrysanthemums.

#### Autumn Show of National Chrysanthemum Society.

Tuesday added another to the rainy days of this unpropitious year, and on Tuesday and Wednesday the early exhibition of the National Chrysanthemum Society was held. With a most disastrous season, and the change to an outlying exhibition place—the Crystal Palace, to wit—the October show of 1903 must be recorded as all but a failure so far as Chrysanthemums are concerned. It could have been called with equal or more justice, an Apple or a Dahlia show.

For twenty-six years the society's exhibitions had been held in the Royal Aquarium, now razed to the ground, and the

forging ahead) is true; but it is more than merely pessimistic to say that it is in a decline. We hope to see it accomplishing good work for many years to come.

It ought to be clearly understood that all exhibitors at the society's shows must be members. At the present show, and the others to follow, we believe we are correct in saying that the institution of a payment of entrance fees by exhibitors is new, and we are curious to know how far this might have affected the entries at Tuesday's show. The judges were Mr. M. Gleeson, of Stanmore, and Mr. A. Jefferies, of Harlow.

Only one new variety received the F.C.C., namely, a dim

lilac-pink seedling Jap. named *Renée*, with flowers of good depth, from Mr. T. Bullinney, Cauns Park Gardens, Edgware.

#### DIVISION I.

##### Open Classes—Cut Flowers.

There were but two competitors for the group of *Chrysanthemums* and foliage plants, the first prize being awarded to Messrs. J. Peed and Sons, West Norwood, for a nice display, in which the foliage plants appeared to better advantage than the *Chrysanthemums*. Mr. R. Foster, Nunhead Cemetery, second with a pretty decorative group.

**CUT FLOWERS.**—In the class for twenty-four blooms (Japanese) in not less than eighteen varieties, there were three competitors, Mr. Jas. Brooks, gardener to W. J. Newman, Esq., Totteridge Park, Totteridge, being awarded the first position with a good stand, composed chiefly of white, yellow, and lilac varieties. They were represented by Mrs. T. W. Pockett (good), Madame Gustave Henry, Marquis V. Venosta, J. R. Upton, Mrs. R. Darby, Mrs. H. Emmerton, Mrs. G. W. Palmer, Mrs. W. Popham, Scottish Chief, Mr. A. H. Barratt, Mrs. J. C. Neville, Soleil d'Octobre, Miss Alice Bryon, Lady Crawshaw, M. L. Remy, Lily Mountford, Pride of Exmouth, Godfrey's Pride (good), and Soleil d'Octobre.

Mr. W. Ring, gardener to J. Warren, Esq., Capel House, Waltham Cross, made a good second, having a better display of colours. The best were Bronze Soleil d'Octobre, Kimberley, Madame P. Rivoire, Mrs. T. W. Pockett, Miss Elsie Fulton, Mrs. J. Bryant, and Mutual Friend; while Mr. H. Perkins, gardener to the Hon. W. F. D. Smith, M.P., Greenlands, Henley-on-Thames, brought up the rear with a good exhibit.

In the class for twelve blooms Japanese, distinct, there were four contestants, the first prize being awarded to Mr. J. Boakes, gardener to J. Dixon, Esq., Edenhurst, Sevenoaks, who had a pleasing stand. The varieties were Madame R. Ray, Mrs. W. Popham, Marquise V. Venosta, Mme G. Henry, General Buller, Charles Longley, Elthorne Beauty, Soleil d'Octobre, Miss Elsie Fulton, Mr. C. H. Payne, Mrs. Greenfield, and Marjorie. Mr. Jas. Brooks was second, having in good form Mrs. A. R. Knight, Mrs. J. C. Neville, Sensation, J. R. Upton, and Mrs. T. W. Pockett; while Mr. M. Rayment, gardener to W. Beech, Esq., Romford, brought up the rear.

The class for six Japanese blooms, distinct, brought out three exhibits. Mr. A. Mackay, gardener to F. H. Bouden Smith, Esq., Danesbury, Hertfordshire, being a good first, having Mrs. G. Mileham, General Hutton, Mrs. C. H. Payne, Miss E. Fulton, Miss Lily Mountford, and Madame Gustave Henry in good form. Mr. J. Kirkwood, gardener to E. Wormald, Esq., Finchley, was a good second with nice blooms of Bessie Godfrey, Miss Elsie Fulton, and Sensation of fine colour, while Mr. G. Boakes was third.

For twelve bunches of early flowering pompons in eight varieties there was but a solitary exhibit, which came from Mr. E. F. Such, Maidenhead, and these were of a very poor character, staged without names too.

The class for two vases of twelve blooms of large flowering varieties, with foliage added according to the exhibitor's taste, though it only obtained three entries, was one of the best classes here. The first prize was awarded to Mr. J. Kirkwood for a fine exhibit; Mr. Jas. Brooks being a good second with equally well arranged vases; and Mr. G. Boakes third with a bold display.

**EARLY FLOWERING VARIETIES.**—There was but one entry in the class for twelve bunches of early flowering varieties from plants grown in the open air and not disbudded. This exhibit came from Mr. E. F. Such, Maidenhead, who made a really good display. The varieties were Mr. J. R. Pitcher, Ralph Curtis, Coral Queen, Goacher's Crimson, O. J. Quintus, Queen of Earlies, White Quintus, Horace Martin, Ambrose Thomas, Market White, Madame Desgrange and Bronze Masse.

##### Decorative Exhibits—Open.

The floral decoration of Mums for a dinner table of six feet by three feet with any suitable foliage brought out three entries, all the exhibitors using yellow varieties with bronze foliage, Mrs. C. B. Cole, The Vineyard, Feltham, being awarded first for a tasteful display. Mr. D. B. Crane, Highgate, was second; and the third prize was evidently not awarded. Miss C. B. Cole was the only exhibitor for three epergnes, and was deservedly awarded the first prize for nicely arranged vases of yellow and bronze.

##### Amateurs' Classes—Cut Blooms.

Section A, comprising classes 11 and 12, brought no entries; and class 13, in section B, for twelve Japs. in six varieties, was also unsupported. However, in class 14, for the twelve bunches of early flowering pompons, in six varieties, two came forward, but both were very poor. Mr. D. B. Crane was the leader, and Mr. A. Taylor second.

#### DIVISION II.

##### Open Classes—Cut Blooms.

For the six bunches of early flowering pompons, in vases, four entered, and Mr. E. F. Such had a fine set, including Md. Lefort, Blushing Bride, Mrs. Selby, and Flora. Mr. D. B. Crane followed next with Veuve Cliquot, Alice Butcher, Anastasia, Blushing Bride, Mme. Ed. Lefort, and Percy's Seedling. Mr. J. Kirkwood came third.

Mr. D. B. Crane, in class 16, was first for six bunches of early flowering varieties, those shown being Ivy Stark, Harvest Home, Horace Martin, Orange Masse, Goacher's Crimson, and Crimson Mdme. M. Masse. The second place fell to Mr. J. Brooks, Totteridge Park, with R. Curtis, Mme. M. Masse, Percy's Seedling, Robbie Burns, Victor Mew, and Crimson Marie Masse, Mr. Kirkwood was third, one of his bunches being Ralph Curtis. There were four entries.

For one vase of six yellow Japs, Mr. W. Ring, gardener to J. Warren, Esq., Capel House, Waltham Cross, led with Mrs. T. W. Pockett, the flowers being good; Mr. H. Perkins, Greenlands, Henley-on-Thames, was second with Hon. Mrs. Acland, a rich incurved Jap. There were no entries for six of a white variety; and for the half-dozen other than white or yellow the lead was with Mr. J. Kirkwood, Grass Park House, Finchley, with grand flowers of Mrs. Barkley; second, Mr. Perkins, with Mrs. R. Darby.

Pompons were staged in class 20, the winners for a vase (with suitable foliage) being Mr. Eric F. Such, from Maidenhead; Mr. D. B. Crane, Highgate, and Mr. J. Kirkwood, in the order mentioned. The only entry in class 25, for a vase of *Chrysanthemums*, came from Mr. Kirkwood.

Miss C. B. Cole beat Mrs. A. Taylor for the handbasket of blooms (c. 21), the first being in yellow, and very tasty. For a handbasket of garden flowers, *Chrysanthemums* and *Roses* excluded, Miss C. B. Cole again led, having Michaelmas Daisies; Mr. E. F. Such, second, with these and Solidago; and third, Mrs. Taylor. Miss Cole had a nice basket of autumn sprays with berries; Mrs. Taylor second; while for a basket of *Roses* Mr. Such beat Mrs. Taylor.

##### Amateurs' Classes.

Mr. W. H. Chalk, Slough, had the best six blooms of Japanese (Div. B.), and equal thirds were given to Mr. F. Wells, South Norwood, and Mr. W. Gooding, Edenbridge, Kent, the blooms being very fair.

For an epergne of flowers of the Autumn Queen, Mr. Crane beat Mrs. A. Taylor, of East Finchley.

##### Non-competitive Exhibits.

Messrs. John Peed and Son, West Norwood, London, S.E., were able to stage an excellent display of Turnford Hall Begonias, in 4in, 5in, and 6in pots, though the flowers at this season are much tinged with pink. From "Hobbies," Limited, of Dereham, there came perennial Asters, *Roses*, and Dahlias. The *Roses* were staged in bamboo tubes, and the varieties were Souvenir de Pierre Notting, Liberty, Corallina (a good autumn Rose). The best of the new Cactus Dahlias for garden decoration was the new Amos Perry, a strong flower of Cactus form, somewhat broadened petals, and rich, scarlet crimson colour. It has been certificated twice. The Tamarix was used in small vases effectively in front of the Dahlias.

Messrs. Wm. Cutbush and Sons, from Highgate, London, N., sent Dahlias, Asters, and Carnations. We were also pleased to note the autumn Crocuses, together with Montbretias, *Morina longifolia*, *Campanula muralis*, *Lobelia tenuior*. The latter was very showy, and the Carnations were strong. Mrs. S. J. Brooks is a fine white; Viscount Kitchener, a good flaked crimson; and Mrs. T. Lawson, of course, an excellent carmine-red Carnation.

Cannell and Sons showed their finely grown Cannas, in the same form as that so often seen from their nurseries. We would name Black Prince, Emile Lorenz, Miss Amy Ker, Rosemawr, C. Molin, and J. B. Van der Shoot as the most brilliant as seen here.

Mr. Wm. Angus, The Gardens, Penicuik, N.B., staged his new *Chrysanthemum maximum* King Edward, a good border flower, with large flower. It is the "king amongst Marguerites." Messrs. Spooner and Sons, Hounslow, staged a large collection of Apples. Mr. W. Seward, The Firs, Hanwell, W., staged his Tomato "Hanwell Victory."

Messrs. Cannell had an exhibit of market *Chrysanthemums*, such as Covent Garden White, Ryecroft Gold, White Quintus, Murillo (a lovely pale mauve and white), Harry Gover, and Miss B. Miller.

Mr. W. J. Godfrey, Exmouth, Devon, had Pride of Exmouth Carnation, a rose-pink variety, and some good *Chrysanthemums*: Yellow Prince, M. Marcel Mestivier, Harry Gover, Parisiana, October Rose, and Britannia. His plants of *Fuchsia triphylla* "Mary" were good.

Mr. Norman Davis, Framfield, Sussex, made a good display, arranged in bamboo stands, on boards, and in pots, with *Asparagus Sprengeri* and *Panicum variegatum*. The best were James Grant, Lady Pearce, Mrs. A. K. Knight, Kimberley, Madame

Paolo Radaelli, J. R. Upton, and Princess Beatrice. The best decorative varieties were Horace Martin, Goacher's Crimson, and Market White.

A fine decorative exhibit of Dahlias was staged by Messrs. T. S. Ware, Limited, 1902, Feltham, the whole being nicely arranged with Ferns, bamboo, and other greenery. The best Dahlias were F. H. Chapman, Mrs. H. J. Jones, Gabriel, Alpha, Artus, Kriemhilda, Mrs. Ed. Mawley, Ringdove, and Sandpiper. Messrs. Ware's single and double Begonias, too, from the open air, were quite a revelation to everybody.

Mr. Eric F. Such, Maidenhead, contributed a beautiful table of Chrysanthemums of the early type, with large vases of Pampas Grass and Asters, nicely arranged. The vases of Physalis Franchetti and Montbretias contributing to the display. The educational value of the exhibit was entirely lost through lack of naming the subjects.

Mr. H. J. Jones, Rycroft Nursery, Lewisham, contributed one of the best displays in the show, in the form of early flowering Chrysanthemums and Asters. In the former were noted as being especially good Goacher's Crimson, Horace Martin, Hilda Blick, Mrs. W. A. Hobbs, Mrs. A. Willis, Miss B. Miller, Mytchett Beauty, and a promising set of seedlings. The Asters were beautifully displayed in large bunches, a few of the best forms being A. amellus, Stella, Framfieldi, Onward, A. cordifolius magnificus, A. C. Diana, A. Novæ-Angliæ, rosea, and Rycroft Pink, also Mrs. Raynor, this portion of the exhibit being nicely arranged with Asparagus Sprengeri.

Messrs. Cheal and Sons, from Crawley, were the exhibitors of a magnificent bank of Dahlias, and a choice selection of Apples; and from Hugh Low and Co. there was also a display of Apples, numbering 150 dishes.

#### Medal Awards.

CRYSTAL PALACE COMPANY'S GOLD MEDALS to Norman Davis and W. J. Godfrey.

GOLD MEDALS to Messrs. Cannell and Sons, J. Peed and Sons, "Hobbies," Limited, H. J. Jones, Cheal and Sons, T. S. Ware, Limited, and Spooner and Sons.

SILVER GILT MEDALS to Messrs. Hugh Low and Co., and SILVER MEDAL to Eric F. Such.

## Sir William Jackson Hooker.

(Continued from page 304.)

"In 1813, owing to the illness of his only brother, my father spent five months with him in Devonshire and Cornwall, which counties he diligently explored for Musci, Hepaticæ, and Lichens especially. The Trinity House yacht having been placed at his disposal, he visited the Scilly Islands, whence he writes to Mr. Turner: 'The first thing that caught my attention was the situation of the little town of St. Mary's which so much resembled that of Reikevik that I could hardly help fancying for some time that I was in Iceland.' Early in 1814 my father accompanied Mr. and Mrs. Turner and family on a visit to Paris, then in the occupation of the Allies. There, at the Institute, he made the acquaintance of the principal botanists resident in or on visits to the city—Antoine-Laurent de Jussieu, Desfontaines, Lamarek, Mirbel, Bory de St. Vincent, Thouin, and others. Leaving the party in Paris, he spent the remainder of the year botanising and seeing botanists, sketching and sight-seeing in the south of France, spending some days with De Candolle at Montpellier and in Piedmont, Switzerland, and Lombardy.

"Returning to Paris early in 1815, he was introduced to Humboldt, who engaged him to publish a cryptogamic volume of his *Plantæ Equinoctiales*. This intention had to be abandoned owing to the publisher's refusal to continue that work. After much subsequent correspondence with Humboldt, that led to nothing, my father commenced the publication on his own account, and produced in 1816, the first part of a work entitled '*Plantæ Cryptogamicæ, quæ in plaga orbis novi Equinoctialis colligerunt Alex. von Humboldt et Aimat Bonpland*.' It is a very thin quarto, with four plates of species drawn by the author, and exquisitely etched by Edwards. The expense was great and the return nil; the work was therefore abandoned, and of the remaining Musci and Hepaticæ many were included in the author's less expensive '*Musci Exotici*.'

"On June 12, 1815, my father married Maria Sarah, eldest daughter of Dawson Turner, and immediately started on a long wedding tour to the Lake District and to Ireland, which latter country the pair traversed in almost every direction, making sketches of scenery and ancient buildings; thence they went to Scotland on a visit to Mr. Lyell at Kinnordy in Forfarshire, with whom a close intimacy and correspondence on Hepaticæ had long existed. Returning they passed through Manchester for the purpose of seeing Mr. Hobson, a packer in a warehouse, who with only the works of Withering, Hudson, and the '*Muscologia Hibernica*,' had acquired a critical knowledge of British Mosses that surprised his visitor, who says of him: 'I never saw a man possessed of more enthusiasm than this poor fellow.'

"As alluded to by M. De Candolle [in a letter here omitted], Lindley, then a youth of eighteen, was at the same time as himself a guest of my father. He was the son of a well-known nurseryman of Catton, near Norwich, and had shown such zeal and ability as a local botanist that with a view of encouraging him in its pursuit he was invited to Halesworth, and to occupy himself there with translating Richard's '*Analyse des Fruits*.' This he did, introducing the author's latest corrections, and illustrating his translation with plates and original observations. In the following year my father took Lindley to Sir Joseph Banks, who offered him temporary employment in his herbarium, and introduced him to Mr. Cattley, a wealthy merchant devoted to horticulture, who was desirous of having his rare plants handsomely illustrated; and this again led eventually to the assistant secretaryship of the Horticultural Society of London, which Lindley occupied till 1858.

"The '*British Jungermanniæ*,' the most beautiful of all my father's works, in point of the drawing, analyses, and engraving of the plates, was concluded in 1816. It had occupied him for about ten years, and was the first work of any magnitude which he projected. It appeared in parts, in both a quarto and a folio form, with eighty-eight plates engraved by Edwards, illustrating 197 species.

"1817 is one of the very few years of his life in which he published scarcely anything. The exception was an account of the very remarkable European Moss named after his friend, *Tayloria spachnoides*, in '*Brand's Journal of Science and Art*,' No. 111, p. 144, and '*Musci Exotici*,' tab. 173. Of a visit to London in August of this year he writes: 'I met at Spring Grove (Sir Joseph Banks's) Abel, Brown, Leach, and a Mr. Manning of Diss, who passed many years among the Chinese endeavouring to get access to the interior, though he failed; though he tells me he saw much of Thibet.' Mr. Manning is, to this day, the only Englishman who ever entered the sacred city of Lhasa. What is more remarkable is that his journal was lost to geographers till Sir Clements Markham happily found it in the possession of a cousin of his own in Norfolk. See '*Narratives of the Mission of G. Bogle to Thibet and of the Journey of T. Manning to Lhasa*,' ed. 2, 1879, by Sir C. Markham, a book full of curious information.

"My father's Halesworth life was now drawing to a close. The brewery business, as might have been expected under the management of an enthusiastic naturalist and author, had proved unsatisfactory, and some of his investments were disappointing. Personally his *ménage* was entirely inexpensive and simple, and this was so throughout his life; but his lavish expenditure on his own unremunerative publications, and on the purchase and beautiful binding of expensive entomological, ornithological, and especially botanical and even archæological and artistic works, had crippled his resources, and he had now a wife and family of four to provide for.

"Under these circumstances he wrote to his friend Sir Joseph Banks requesting that he might be informed should he hear of any opportunity of applying his botanical knowledge to the improvement of his income. Sir Joseph promptly answered that the Professorship of Botany was vacant in the University of Glasgow, and that he was ready to use his influence to obtain it for him should he desire to become a candidate. My father answered favourably, and at once left for Spring Grove, where he was hospitably received by Sir Joseph, who told him that the emoluments of the chair, though small, would certainly increase; that it was freed from all medical duties; that a really noble botanical garden had been formed at Glasgow, to which the University had given £2,000 and the City £3,000, and towards the development of which he could assure him that Kew would place all its resources."—[A Biographical Abstract compiled by Irwin Lynch from a Life-Sketch sent to the "*Annals of Botany*" by his Son, Sir Joseph Dalton Hooker, F.R.S., V.M.H., G.C.S.I., C.B., &c.—*Journal of Royal Horticultural Society*.]

(To be continued.)

LARGE YIELD OF POTATOES.—A phenomenal yield of Potatoes of the "Sir John Llewelyn" variety was dug recently by Mr. J. Taylor, blacksmith, of Clun, Herefordshire. Mr. Taylor planted 1lb of this sort in the spring, and the weight which they yielded was over 30lb.

TOMATOES IN A BAR.—At the present time, we are informed, one may witness Tomatoes growing on a plant in the saloon bar of a large hotel in Central London. A few months ago a young plant was introduced, the branches climbing up cane sticks, which, with a perpendicular upright, resembled a large kite. The temperature of the place is about 65deg Fahr., and now the plant is full of fruit almost fully matured.

THE STORMS AND THE TREES.—At Le Touquet, where the quaint old château is surrounded by about two thousand acres of beautiful woods, the foliage was quite green on the day of a recent storm, but on the following day it was changed to a muddy brown. This was not only on the side exposed to the wind, but was general, trees in sheltered places suffering in common with those which caught the full fury of the gale. It would be interesting to have this phenomenon explained.

### A Great Disappointment.

As fate would have it, the district auditor cited me for the 29th ult. to attend at the Board Room at Bradfield, Berks, for the purpose of auditing my poor's rate for the parish of Sulhamstead. How much more congenial it would have been for me to visit the dear old garden at Chiswick, which has been familiar to me through all its successes and vicissitudes since the year 1835. I was for the first time taken there to a R.H.S. annual fête by the then president, T. A. Knight, as these pages of long, long ago have chronicled.\* I mention it now to show how much I should have enjoyed, and grieved, being there for the last time, and also delighted to have attended the gardeners' dinner; perhaps, as a V.M.H., I may have been expected to attend. But district auditors are great potentates, and must be obeyed!

What with attending to voting lists, to jury lists, to assessment committees, and as churchwarden seeing to the completion of a thorough reparation and embellishment of our St. Michael's Church, and our harvest festival, you may conceive that your oldest contributor has spent a tolerably lively time lately. Besides the care—seeing to the “getting up” of and housing of my new strains of North American hybrid Potatoes—this has been a test year for them. They are behaving very well indeed, but it will take five to six years for the majority of them to be made fit for commerce.

By-the-by, what men we have in the Potato world nowadays! And what wonderful prices they are, it is said, receiving per lb for their new seedlings! Of course, we well know that the last well advertised Potato is the best. Nevertheless, I lay claim to be still taking the lead by introducing new blood, so to speak. I trust that disinterestedness, like in the honest, enjoyable old games of cricket, football, &c., are not departing from us in regard to the Potato.—ROBT. FENN, V.M.H., Sulhamstead, October 5, 1903.

### The Gardeners' Dinner.

I am desired by the committee of the above to return you their grateful thanks for the generous help and support you gave this function in the pages of the Journal, thus helping to make it a most successful and memorable gathering of gardeners.—Yours very truly, OWEN THOMAS, Chairman of Committee.

Four gardeners' dinners have been held since that of 1866 at St. Martin's Hall, Long Acre, at which Lord Henry G. Lennox, M.P., presided; viz., one at Leicester, in 1868 or 1869, at which, I think, the Mayor of Leicester presided or the present Dean of Rochester. This was in connection with the Royal Horticultural Society's Provincial Show; another a little later at Nottingham, and on a similar occasion, when Mr. Alderman Manning took the chair; a third was held at the Lower Grounds, Aston, Birmingham, on the occasion of a large flower show, at which Mr. Joseph Chamberlain, then Mayor of Birmingham, and not then an M.P., filled the chair. This dinner was largely attended, and it goes without saying, the chairman was a great success. The fourth was held at South Kensington some years ago in connection with one of the large flower shows of the R.H.S. in the gardens; on this occasion the late Mr. William Thomson, of Clovenfords, presided. It is, therefore, not correct to state, as your reporter did, that no such dinner has been held since 1866. [We meant in magnitude and splendour.—Ed.] I acted as the secretary to the Dinner Committee in 1866, and I attended all the dinners to which I have referred.

A gardeners' dinner on the evening of a show day is always a risky affair. Exhibitors and judges are wearied over the day's exertions, and many soon become impatient of talk. The King's Hall is, as I know from experience, a trying room to speak in; it is difficult to send the voice into all its parts. On the 29th, the R.H.S. was made a little too prominent, and we could well have spared the superfluities from its trumpeters. By the time the toasts, more particularly those relating to gardeners, were reached, the patience and sense of the countrymen had risen in rebellion against the incessant preaching of enthusiastic speakers. The gardeners would tolerate none of their kind as orators. I am free to admit the disturbing element was on the fringe of one side of the hall, and it was strenuous enough to dominate over the large majority who were disposed to listen. There were too many toasts and far too many speakers. I had ill placement in following the encore of a rollicking song, which added to the

difficulty of gaining a hearing. A little more forbearance would have finished the programme in good time. Nevertheless, the occasion was a memorable one. Everyone appeared good humoured: even the discomfited speakers knew there was no ill feeling on the part of the tired, but assertive audience.—R. DEAN.

### Lessons from the Chiswick Show.

A great combined exhibition of fruit and vegetables like that recently held in the historic gardens at Chiswick cannot fail to teach lessons which will have a lasting effect on the community of gardeners at large, and one of them, which does not appear to have dawned on the authorities before, is the practicability of holding a vegetable show in conjunction with one of fruit.

I say practicability, but the word should be qualified, and I am reminded of that absolute necessity which is referred to in the opening remarks of the show report (page 312), namely, money. An autumn show like the one under notice cannot be expected to be a paying concern, because gate money is not a big item, and though the society is reputedly in a prosperous condition it has the expenses of the new hall and the prospective expenses of the new garden hanging over it, so that increased revenues are invested, so to speak, in the business.

Money is the great motive power which turns exhibition machinery as it does most other things. Unless it is forthcoming, what hope can there be of a continuation of shows such as that recently held? It is the business of the Royal Horticultural Society to know what funds it will be able to spare for future shows, and how the subscriptions came in on this occasion I know not, but I simply mention the point for the benefit of those who talk glibly of what should be done next year without apparently taking the financial part of the business into consideration. Can the R.H.S. afford to run big shows at a financial loss? It appears to be part of the programme of the sister society, the Royal Agricultural, to do this, and yet they keep running; but how the R.H.S. stands in this respect is, of course, another matter. It is only fair that the Fellows should expect something for their money, and I take it that shows are included in the something, but how many, and of what proportions they should be is a point belonging entirely to the question of finance. [According to the Rev. W. Wilks, Secretary to the Society, the Fellows already receive a tenfold return for their guinea subscription.—Ed.]

As a rule, vegetables do not occupy a leading position at large shows. It is true they are represented at most of them, but there seems to be a general impression that they do not attract in the same way as fruit and flowers. Let us hope that the lesson taught at the last of Chiswick's many shows will abolish that idea for ever. There was grand fruit in plenty at the show in question, but instead of monopolising the interest it was equally divided, or perhaps it leaned on the side of the vegetables.

The latter division attracted unqualified attention, and I do not see how anyone could observe the splendid displays set up by Messrs. Beckett, Gibson, and Bowerman amongst the amateurs, and Messrs. Dobbie, Richard Smith and Co., R. Veitch and Son, Cheal, Bunyard, Cannell, and others amongst the trade growers, without admitting that they alone were worth going a long way to see.

Size was not aimed at, and coarseness was avoided, which was another useful lesson to those who still seem to hold the impression that a vegetable must be a giant in order to come up to exhibition standard. There were giants, of course, especially amongst the Onions; but these are an exception, and while it is generally admitted that size is no drawback to the quality of an Onion, provided the bulb is well grown and harvested, Onion growing has a peculiar fascination for those who make vegetables a speciality, and they could hardly help going in for monsters if they wished to.

I plead guilty myself to a little weakness for Potatoes, and spent considerable time over the magnificent display set up by Dobbie and Co. Nothing would have pleased me better than to have seen the faces and have heard the remarks of a few scores of cottage garden Potato growers, whom I know, if they could have been present. The Rothesay tubers taught a lesson, too, not only in the way Potatoes may be grown, but also in the art of presenting them for show. There were varieties both old and new, all free from blemish, and in the pink of condition, which went to prove that in some quarters at least Potato growing is reduced to a fine art. Another notable collection from the North, was the dozen varieties from Ormskirk which won the first prize for Lord Lathom's gardener, Mr. B. Ashton.

Few people who visited the show needed any lesson about the scarcity of outdoor fruits this year, but they got one all the same, and those who are used to seeing the grand displays at the Crystal Palace in the past probably voted the fruit to be small in quantity, small in size, and not overburdened with colour and finish. Here and there one observed notable exceptions, but signs of the general failure of fruit crop were painfully apparent

\* See "Pre Victorian Days" in issue of April 19th, 1900.

at Chiswick. Under the circumstances, it could hardly be otherwise, and I was somewhat surprised to see this part of the show so good as it was.

The orchard house fruit, however, made up for any deficiencies in the outdoor section, and was superb. It mostly came from Messrs. Bunyard and Co., Maidstone, but it had a lesson to teach to wealthy garden owners, namely, that if they would have fine fruit irrespective of season, the line is to erect orchard houses and adopt this style of culture. It has been proved without doubt that the finest Apples and Pears can be grown in pots under glass, and in these days of great wealth it is the finest and the best that are needed for the tables of the affluent. Considering these facts, and also the uncertainty of the British climate, as experienced this year, it will not be surprising if there is a great extension of orchard house fruit culture in the future, and such displays as that recently seen at Chiswick can hardly fail to give impetus to the movement.

There were notable absences amongst the exhibitors in the gardeners' division. One missed the burly form and smiling face of the late Mr. McKenzie, of Linton Park, near Maidstone, as well as the fine Apples he invariably staged. But the angel of death has been busy since the last R.H.S. fruit show, and "old Mac," as his intimate friends called him, has been taken away. The redoubtable Mr. Woodward, too, was not in the fighting line, and one naturally concludes that the frost last spring upset his calculations, as it did that of many others. It seems, however, that a Kentish grower must always be the leading single dish man, and chief honours fell to Mr. Stowers, of Sittingbourne, who staged some really fine fruit for the season, and proved by illustration that a few places escaped from the rigours of wintry weather at blossoming time.

Why does the R.H.S. fruit show not bring out more talent among the private growers of fruit under glass? We have the recollections of the great fights at Shrewsbury and Edinburgh fresh in the mind, after which mighty London has to take a very low place. The prizes are too small, do I hear someone whisper? Ah! now we have it, and of course choice fruits are not carried about the country for nothing, and gardeners are not so wealthy that they can afford to exhibit purely for honour. Still, one can hardly understand only one exhibit appearing in the class for nine dishes of dessert fruits. Where were all the redoubtable growers of the Midlands?

Mr. Goodacre was there from Elvaston, staging a grand collection; but it was disappointing, to say the least of it, that he should have it all to himself. In the class for a collection of six dishes, too, there was only one competitor, and again in class 3, for a collection of Grapes in six varieties, the Elvaston champion was the only exhibitor who staged. Muscat of Alexandria appeared to be the most popular Grape, and with this exception the competition was quite commonplace in the single variety classes.

This state of affairs needs some explanation, because the frost did not affect indoor fruit, if it ruined that outside. It is to be hoped that exhibitors have not got so used to seeing the name of Goodacre on first prize cards that they do not care to compete with him, but evidently there is something wrong.

The lessons were not taught alone by the show itself, as there were useful hints to be picked up from the different papers read at the conference, which was attended by a fairly large muster, and the final one was that which illustrated the good fellowship and freemasonry of British gardeners. It was given in the King's Hall at the Holborn Restaurant, and the occasion was the long-talked-about gardeners' dinner, and next to a good show there is nothing that the average gardener enjoys more than a good dinner. I believe they got both.—G. H. H.

### Potato, Northern Star.

Having read so much just recently of the fabulous prices secured for this Potato, I am naturally interested, as doubtless many other readers of your popular journal are, and wish to know more about it. What is the history of its origin? One would also like to know whether the accounts of its heavy cropping and disease-resisting qualities are reliable. If all one reads of its behaviour in the present and last seasons (1903 and 1902, admittedly such bad Potato years) is correct, then "Northern Star" should indeed prove a real acquisition, and I venture to think we shall all offer our heartfelt thanks to the raiser for giving us a "spud" that will yield a good crop without the endless trouble of spraying, re-spraying, and spraying again.

Will someone who knows be kind enough to give me a little information? Also if the still more recently introduced "King Edward VII." and "Evergoods" are improvements upon "Northern Star"? One naturally supposes that such enormous croppers require to be planted at much greater distance apart than is customary with ordinary varieties.

What has our old friend, Robert Feun, to say on the subject? —WILMOT H. YATES, Rotherfield Park, Alton, Hants.

The variety was raised by Mr. Findlay, of Markinch, Fife-shire, N.B. The tubers are roundish, smooth skinned, and have both a whitish skin and white flesh. The accounts of its heavy cropping and disease-resisting merits seem to be true so far. The continual rapid propagation of it from both "sets" and cuttings, cannot, we think, do the plant justice, and the consequences may

*Spiraea Thunbergi.* (See page 327.)

be apparent in a year or two. Thirty inches should be allowed between each set. It has been stated that seedling varieties of Potatoes are more or less disease-resisting during the first fifteen years of their history. We trust our own remarks will be supplemented by those from readers.—ED.

### Annie Elizabeth Apple.

A tree of this variety was planted in an orchard here about twenty-seven years since. The yield for the last ten years would average seven bushels a year. The Apple crop this year is considered nearly a failure, but I have a fine crop of this variety. Through the high winds, two and one-half bushels have been blown down, and I now estimate the quantity on the tree at seven bushels. It is one of the very best cooking Apples grown: a good cropper, with fine fruit, very few small ones, and is of beautiful appearance if kept for a time. It also keeps well into the spring. I have no trouble to sell them at what I consider a good price.—NORTH HANTS.

**Pear, Marie Benoist.**

An excellent dessert Pear, ripe during January and February. Our figure represents a medium-sized fruit, but it attains a very large size at times. The flesh is white, juicy, sweet, and melting, slightly perfumed. The tree grows well and bears freely.

## Mr. Chamberlain's New Garden.

During the recess Mr. Chamberlain has been busily engaged in planning some new features to his garden at Highbury, and although the planting will not be completed for a considerable time, the various beds have been cut out, and some idea can be gained of what the addition will be like when it is finished.

As is the case with all his ornamental gardens, the late Colonial Secretary is his own designer, and carrying the whole idea in his mind's eye he disdains to use a plan, but, apportioning so much time every day to the work, he is at the garden giving instructions and directing the operations.

For the purpose of the construction of this new garden a piece of ground about an acre and a half in extent has been taken from the park. After planning the beds so that no other garden should be shut out of sight from the main drive, the work was commenced with the introduction of a patch of Bamboos in something like two dozen varieties.

Then a certain portion has already been planted with all varieties of Roses, such as Bourbon, Chinese, and Polyantha, in variety. Hybrid Perpetuals, Hybrid Teas, Damask, Provence, the Old Moss, the Crimson Rambler, and varieties of pillar Roses, whilst alongside there is a long ridge of *Rosa rugosa*, pink and white, and clusters of Penzance Briars.

All the groundwork is of natural grass. There will be a network of beds varying in size from very small to 50ft by 10ft in every conceivable shape. Commencing near the lodge there is a winding walk which will command a view of every detail of the garden. The garden will be planted with flowering shrubs and trees, ornamental foliage in all shades, hardy perennials in masses, and annuals also in masses.

The new garden is really a continuation of the rock Alpine and Italian gardens, all of which are, by the way, masses of flower and looking bright and gay despite the dull sun. Adjoining these gardens, and before the new one is reached, is a Dutch garden, which is surrounded by a Holly hedge. One of the sections

of this plot is confined to Narcissi, all choice varieties. The second is for bulbs, and the other section is devoted to the cultivating of all the best and choicest species of Iris. The paths are of a terra-cotta pattern of red brick substance, specially selected. Its appearance is very quaint, and, like all the other gardens, it has been laid out entirely from the master's designs by his head gardener Mr. Deacon, Mr. Chamberlain's practice being to never leave the ground until the plot is ready for planting. In concluding its notice the London "Evening News" observes that only two or three of the beds of the new large garden have as yet been planted, but it is easy to see that both in design and colour it will be a magnificent addition to the park.

## The Elm.

Some writers think that the Elm (*Ulmus campestris*) is not a native of this country, but they have no reasonable grounds on which to found such an opinion. The name *Ellm* is Anglo-Saxon, and appears to be derived from a root-word indicating height and strength. As corroborative evidence, justly cited by Dr. Hunter, are nearly forty places in England, mostly mentioned in Domesday Book, which have their names compounded with the name of Elm.

Whenever any plant has associated with the times of its leafing or flowering the seasons for performing garden operations, that is a certain indication that the plant was in England, as lawyers say, "before the memory of man runneth to the contrary." The Elm is one of those guide plants accepted by gardeners in the olden time, and they had this rhymed kalendarial warning:

When Elm leaves are as big as a shilling  
Plant Kidney Beans if to plant 'em you're willig.  
When Elm leaves are as big as a penny  
You must plant Kidney Beans if you mean to have any.

Nor were our countrymen the earliest to deduct indications from those leaves, for Virgil wrote that

Each trembling leaf with some light vision teems.

Miller states that "Queen Elizabeth is said to have planted an Elm with her own hand at Chelsea. It went by her name, and I remember it a stately flourishing tree, except that the top was decayed. It stood at the upper end of Church Lane, and marked the boundary of the parish on the north side. It was felled on November 11, 1745, and sold for a guinea to Sir Hans Sloane, Bart., lord of the manor. It was 13ft in circumference at the bottom, and 110ft high." But Gilpin tells of one far larger that was felled in 1674 on Sir Walter Bagot's Staffordshire estate. Two men were five days in felling it. It was 120ft high, the stool 47ft in circumference; 160 naves for wheels, and 8,660ft of boards were cut from it, and the whole tree was computed to weigh ninety-seven tons.

No tree is better adapted for the formation of an avenue, and not one is more used for the purpose. The most striking example we remember is that at Strathfieldsaye, a mile in length. The fitness of Elms for avenues arises from their branches crossing at a pleasing angle, growing pendant in age, and far above the heads of the passers beneath. Gilpin truly observes that no tree is better adapted to receive grand masses of light, nor is its foliage, shadowing as it is, heavy in effect. Its leaves are small, commonly hang loosely, and the forms picturesque. It is the first tree that salutes the spring with its light and cheerful green, a tint contrasting agreeably with that of the Oak, the early leaf of which has usually an olive cast. In autumn also the yellow leaf of the Elm mixes as kindly with the orange of the Beech, the ochre of the Oak, and other hues of the fading wood.

It was of the common Elm that Hood sang.

The tall abounding Elm that grows  
In hedgerows up and down,  
In field and homestead, grove and park,  
And in the peopled town;  
With colonies of noisy rooks  
That nestle in its crown.

These lines are faithfully descriptive of this Elm, for as a park, hedgerow, and homestead tree it is very familiar, and few trees are more imposing. It is also true that the rooks have a great partiality to the Elm, and it is of its twigs principally that they build their nests. It is not, however, a tree well adapted to the "peopled town." In the country it is majestic as the avenue noticed, and the grand trees at Windsor and other places attest; but in smoky towns Elms are seldom long-lived, and furthermore their peculiarity of suddenly parting with limbs in storm or in calm render them unsafe. It is a singular fact, and not clearly accounted for, that in calm, still, sultry days the huge branches are prone to fall with a crash without a note of warning. On that account it is not suitable for towns, nor yet for village greens where "men do congregate." The Plane is the tree of trees for towns, and for village greens the Chestnut is of free growth, and affords luxurious shade. Who can think of planting village trees without calling to mind the

rural warblings of Longfellow in the well-known song—nay, is it not a hymn?

Under the spreading Chestnut tree the village smithy stands.

Our advice is, therefore, that Elms be planted only in parks, hedgerows, or avenues in rural districts, and not in towns or villages.

That only applies to the subject of our illustration, for there are other varieties of the Elm singularly ornamental and perfectly safe. Drooping Elms are particularly effective as lawn trees. They are quick growers, and their outline is graceful, speedily forming natural bowers if a little care is taken to train their pendant branches; and the gold and silver variegated sorts afford a fine relief to the dense greenery pervading landscape masses.

*U. campestris* and its allies are raised by suckers and layers, but chiefly by seeds, which should be gathered in June as soon as ripe, and sowed in light mellow soil. The ornamental varieties are mostly grafted on stocks of *U. montana*. The trees of all the family may be successfully transplanted even after they have attained to a considerable size, their fibrous roots becoming speedily re-established in fresh soil.—J.

## Societies.

### Royal Horticultural, Chiswick.

The fruit and vegetable show which we very fully reported in our preceding issue, terminated successfully on Thursday evening of last week. We recorded the fact that rain fell on the afternoon of the first day, making pedestrianism very uncomfortable, but the two succeeding days were ideal and autumn-like. The attendance of visitors was meagre, and, we fear, very little business was transacted by the nurserymen and other business folks represented. The show was, however, admired by all, and afforded means of instruction and much of interest to all who saw. We append the names of prizewinners in the few classes not reported in our issue of the show week.

#### Special District County Prizes.

LINCOLN, NORTHAMPTON, WARWICK, LEICESTER, NOTTS, DERBY, STAFFS, SHROPSHIRE, AND CHESHIRE.—Apples (6 dishes): First, Mr. J. Lee, Higher Bebington, Cheshire; second, Mr. Knight, Stamford. Of Pears there were three collections, Mr. Divers leading, and Mr. Hy. Knott second.

WORCESTER, HEREFORD, MONMOUTH, GLAMORGAN, CARMARTHEN, AND PEMBROKE.—For Apples, Lord Biddulph's gardener (Mr. J. Dawes), from Ledbury, beat Mr. Jno. H. Wooton, Byford, Hereford, these being the only two. Mr. Dawes had the only dish of Pears.

SIX NORTHERN COUNTIES OF ENGLAND AND ISLE OF MAN.—Two collections. Apples: Mr. J. McIndoe first; Mr. H. Thellusson, Brodsworth Park, Doncaster, second. Pears: Mr. Thellusson led, and Mr. B. Ashton, of Ormskirk, was second.

SCOTLAND.—Apples, two collections: Mr. Day, of Galloway House, was first; Mr. Jno. Cairns, Coldsteem, second. The same order was followed for Pears.

OPEN TO GROWERS IN THE OTHER COUNTIES OF WALES.—Apples, three collections: First, Mr. A. Forder; second, Mr. R. A. Horspool. Pears: First, Mr. R. A. Horspool; second, Mr. Fox, Highmead, Llanybyther.

IRELAND.—Apples, four collections: First, Mr. H. F. Broad, Aghern, Conna, Co. Cork; second, Mr. J. Weston, gardener to Viscount Duncannon, Piltown. For Pears Mr. Broad led, and Mr. R. McKenna, of Tullamore, second.

#### Peaches, Plums, Cherries.—Division III, Classes 23 to 33.

Peaches, grown entirely out of doors. For three varieties, Mr. Masterson, gardener to the Earl of Camperdown, Weston House, Shipston-on-Stour, was first, showing the varieties Walburton, Princess of Wales, and Sea Eagle; but in the succeeding class for one variety the first prize was awarded to Mr. Vert, gardener to Lord Braybrooke, for Sea Eagle; the second to Mr. W. Mitchell, gardener to J. W. Fleming, Esq., Chilworth Manor, Romsey, for the same variety. The best dish of Nectarines was from Mr. Goodacre.

Only one exhibitor staged six dishes of Plums, Mr. J. Cornford, who was awarded the first prize. For a single dish of Gage Plums there were ten competitors showing Coe's Golden Drop. Mr. J. Vert was first; second, Mr. C. Crane. For any single dish of a dessert variety there was no exhibitor; but for a single dish of a cooking variety nine dishes of Monarch and one of Archduke were staged. Mr. Vert was again first; second, Mr. Carlisle, gardener to G. J. Gribble, Esq., Harlow Grange, Biggleswade. The Morello Cherry class brought four exhibits, the first prize going to Mr. Page, gardener to J. B. Fortescue, Esq., Dropmore; second, Mr. S. Haines, gardener to Hon. D. P. Bouverie, Coleshill House, Highworth.

#### Vegetables.—Division VIII, Open to Amateurs Only.

Six Globe Artichokes (three exhibits), Mr. Beckett first, Mr. Gentile second, third Mr. A. Basil, Woburn Park, Weybridge. There was no competition for climbing or dwarf French Beans. Scarlet

Runners or White Runner Beans were abundant, and the quality was superior, five lots being shown. First, Mr. B. Ashton, with Sutton's Prizewinner; second, Mr. J. Banks, Castle Hill, Bletchingley, with Sutton's Best-of-All; Mr. G. Zock, Newcomes, Crediton, Devon, third. Red-top round Beetroot brought a good competition, and Mr. Gentile was a good first with Eclipse; second, Mr. Basil. Eleven lots were staged. For six red-top Beetroots, long, first, Mr. Cole, Althorp Park; second, J. Huntley, Esq., Cockburn Lodge, Hirsell, Coldstream; third, Mr. Forder, Ruthin Castle. For green-top Beetroots only one lot was staged.

Mr. J. Brown, Houston House, Renfrewshire, had nice heads of green curled Borecoles, Dobbie's Victoria, being first; Mr. J. Ireland, Kilburnie, Ayrshire, was second with the same variety.

Cauliflower or autumn Broccoli class, three heads, brought six lots. Mr. Cole was first with Autumn Giant; second, Mr. Beckett, with the same; and Mr. W. Waite, Butterknowe, Southfields, third. For three Coleworts or Cabbages there were three exhibits, Mr. Brown having splendid examples of the Imperial Winnigstadt; Mr. R. A. Horspool was second. For Red Cabbage, Mr. Beckett first with dwarf Red Dutch; and Mr. Brown second with Dobbie's Dwarf Red. For Drumhead Savoy, Mr. C. Duruz, Hotel Imperial, Hythe, was first. Carrots formed an interesting class of fine quality. Mr. R. A. Horspool's were splendid, the variety the stump-rooted Smith's Scarlet Defiance; Mr. B. H. Hill was second with excellent Veitch's Model; and Mrs. Dennison third with Early Nantes. For long-rooted Carrots Mr. B. H. Hill was first with Sutton's Intermediate; Mr. Brown was second with Dobbie's Intermediate; and Mr. J. Kennedy, Trinity Bay, Millport, was third with the same. There were four lots of red Celery staged. Mr. Beckett first with Standard Bearer; Mr. Brown second with Dobbie's Selected; and Mr. Fyfe, Lockinge Park, third with Standard Bearer.

For dwarf red Celery, Early Rose (Veitch), Mr. Beckett led; and two persons showed Giant White, Mr. Beckett again first, and Mr. R. A. Horspool second with Wright's Giant White. For white dwarf

*Ulmus campestris*, the Elm.

Mr. Beckett was again to the front with Early Gem. Mr. Fyfe was first with a brace of Cucumbers. There was only one exhibit of six bulbs of Kohl Rabi, and this came from the Guardians, Hornchurch Homes, Romford (gardener, Mr. A. Higgins). For Leeks there were four competitors. First, Mr. Beckett with Dobbie's Champion; Mr. Speirs second with the same; and Mr. Horspool third with New Model. Cabbage Lettuces were excellent. Rev. T. McMurdie was an easy first with Sutton's Supreme; Mr. R. A. Horspool was second with All-the-Year-Round; and Mr. A. H. Rickwood third. For Cos Lettuce Rev. T. McMurdie was first with Balloon; Mr. F. W. Herbert, Nutfield Court, Redhill, second with Veitch's Brown Cos.

Spinach was represented by one dish, and New Zealand (*Tetragonia expansa*) from F. M. Brown, Esq., Southfields, S.W. Tomatoes formed a notable feature. The first prize for four dishes of six fruits was taken by Mr. B. Ashton; second by Mr. B. H. Hill, Crediton, with Frogmore Selected as his best; and third by Mr. H. Forder, Ruthin Castle. Mr. C. Page, Dropmore, was first for two dishes with Winter Beauty and Perfection; second, Mr. Smith, the Convent Gardens, Roehampton, with Perfection and Frogmore Selected. Turnips formed an extensive class, there being seventeen exhibits. Rev. T. McMurdie was first with Model White Stone; second, Mr. R. A. Horspool; and third, Mr. B. H. Hill with Veitch's Red Globe. There were only two yellow-fleshed varieties. Of these last Mr. B. H. Hill had very fine bulbs of Sutton's Perfection, and Mr. Brown was second with Golden Ball. Mr. Beckett was first for a collection of named pot herbs. For any vegetable not in the scheduled classes, Rev. T. McMurdie staged very large white Spinach Beet; and Mr. Brown was second with the Chinese Artichoke, *Stachys tuberosa*.

Onions were remarkable for quality, size, and finish. Mr. E. Beckett first for six very beautiful examples of Ailsa Craig; Mr. Brown, The Worthys, Kingsworthy, Winchester, was second; and Mr. W. Allen, Gunton Park, Norwich, third. Mr. Bowerman had the best bulbs in class 135, with Ailsa Craig; Mr. W. Fyfe was second, and Mr. Beckett third with white Spanish. Of red-skinned Onions only one lot was staged from Mr. Beckett. For six long Parsnips, Mr. Brown was first with Dobbie's Selected; and J. G. Marsh, Esq., Tamworth Road, Hartford, second with shorter roots. In the round, short-rooted class there was no competition. For the best three dishes of Peas there was some splendid produce shown by Mr. B. Ashton, Ormskirk, who had Queen of Marrowfats, Duke of Albany, and Alderman; Mr. R. A. Horspool was second with St. Duthue and Gladstone. The class for six dishes of Potatoes brought one exhibitor, Mr. Forder, who showed General Buller, Windsor Castle, The Colonel, Sutton's Seedling, and Satisfaction. For six dishes, six tubers each, of kidney Potatoes, H. Padwick, Esq., Manor House, Horsham, was first with British Queen; Mr. Brown close second with The Factor, Herd Laddie, and The Crofter. For three dishes of rounds there was only one entry. These varieties were excellent, from Mr. R. Milner, gardener to Miss Talbot, Margam Park, Port Talbot. For kidney-shaped varieties there was more competition, Mr. Brown being a good first, having a grand dish of Sutton's Ideal; Mr. George Crabbe, Park House, Addlestone, being second, having handsome tubers of Supreme and Reliance.

#### Non-Competitive Exhibits.

Messrs. John K. King and Sons, the King's seedsmen, Coggeshall and Reading, were awarded a Silver Banksian Medal for a fine collection of vegetables, including some thirty varieties of Cabbages.

Messrs. Cannell also staged a display of vegetables, in which Onions were particularly good. Messrs. Sutton and Sons had a collection of Potatoes, and a new variety named Discovery was shown. So much as 38lb had been taken from one root. Potatoes also came from Dobbie and Co., Rothesay—a truly wonderful collection, unexcelled in this country. Besides many of their own novelties, the new Northern Star was seen. Messrs. J. Veitch and Sons, Ltd., and Harrison and Sons, Leicester, also displayed exhibits of vegetables.

Those staging fruit or fruit trees were Messrs. Hugh Low and Co.; Cutbush and Son, Highgate; Paul and Son, Cheshunt; Geo. Mount, Canterbury; J. B. Colwill, Sidmouth; Spooner and Sons, Hounslow; J. Cheal and Sons; Horne and Son (dish of Charles Ross Apples); and Geo. Kelf (a new Melon). Mr. J. Ambrose, Cheshunt, Herts, sent a new black Grape named Melton Constable.

#### Medal Awards for Exhibits.

##### MISCELLANEOUS.

Gold Medal to H.M. the King, Windsor Castle (gardener, Mr. Mackellar), for Grapes and Pineapples; Messrs. Jas. Veitch and Sons, Ltd., Chelsea, for a collection of vegetables; Messrs. T. Rivers and Son, Sawbridgeworth, for fruit trees in pots; Messrs. Dobbie and Co., Rothesay, N.B., for (a) collection of Potatoes, (b) collection of vegetables.

Silver-gilt Knightian Medal to Messrs. Sutton and Sons, Reading, for Potatoes; Messrs. H. Cannell and Sons, Swanley, for a collection of vegetables; to the Horticultural College, Swanley, for a collection of vegetables; Agent General for British Columbia, Finsbury Circus, for Canadian preserved fruit; Marquis of Exeter, Stamford (gardener, Mr. Metcalfe), for Melons.

Silver Banksian Medal to Mr. R. W. Green, Wisbech, for Potatoes; Messrs. J. King and Sons, Coggeshall, for Cabbages; Messrs. Harrison and Sons, Leicester, for a collection of vegetables; Mrs. A. Bramwell, Kingsworthy, Hants, for Onions.

#### HORTICULTURAL SUNDRIES.

Silver Flora Medal to Messrs. Jos. Bentley, Ltd., Barrow-on-Humber, for horticultural sundries.

Silver Banksian to Messrs. W. Wood and Son, Ltd., Wood Green, N., for horticultural sundries; Messrs. Corry and Co., Ltd., 13, Finsbury Street, E.C., for horticultural sundries; Messrs. D. Dowell and Son, Hammersmith, for horticultural pottery; Messrs. Pulham and Son, 71, Newman Street, W., Pulhamite stone vases; Messrs. Champion and Co., City Road, E.C., tubs for shrubs; Mr. John Pinches, Camberwell, S.E., for Acme labels.

Bronze Banksian Medal to the Lubroso Paint Co., Moor-gate Station Chambers, E.C., for horticultural paints; Messrs. Valls and Co., Coleman Street, E.C., for Beetlecut; Mr. Jas. George, Putney, S.W., for horticultural sundries; Mr. J. Cannon, Ealing, W., for fruit trees; Mr. H. M. Hamilton, Finchley, N. for horticultural sundries.

Commended to Messrs. Day and Thelland, St. Heliers, Jersey, for new packing case for fruit.

**MONSTER VEGETABLE MARROWS.**—At the Midhurst Flower Show, the Workhouse Master, Mr. A. H. Field, exhibited a Vegetable Marrow weighing 38½lb, and having a girth measurement of 45½in. A second Marrow, of smaller dimensions, turned the scale at 35½lb.

**TREE WITHIN A TREE.**—At Moulton, South Lincolnshire, there is a Willow tree, which in consequence of having been beheaded, and having reached an old age, has become hollow and rotten. From a seed which had dropped into the hollow, a healthy Sycamore has grown to the height of 10ft.

**THE PEAR-APPLE NOT A SUCCESS.**—The possibility of Pear-Apple was suggested to a Worcestershire gardener by finding such a freak on one of his Apple trees. He successfully produced it after several attempts, but it is likely to be valuable only as a curiosity, for there is little that is inviting either in its appearance or flavour.

**PECULIAR HYBRIDS.**—It is possible to produce the strangest crosses. Blackberries, for instance, have been crossed with Strawberries; but though the resulting seed produced plants, these plants were sickly and spindly, and utterly refused to bloom, much less bear fruit. Perhaps the most peculiar attempt at crossing fruits was that between the Black Currant and the Gooseberry, but in spite of every effort it failed.

**THE MENDELIAN THEORY UPHOLD.**—Miss Edith Saunders, at the recent meeting of the British Association, spoke on the results of some cross-breeding experiments with plants. The results, she explained, were in many cases in perfect accordance with the Mendelian theory, and those which at first sight appeared not to be so were on examination found to be reconcilable with the theory. Miss Saunders exhibited diagrams dealing with the Stock and the Salvia.

#### Meteorological Observations at Chiswick.

Taken in the Royal Horticultural Society's Gardens at Chiswick, height above sea level 24 feet.

The weather has been for the most part of the week cloudy and dull, with a considerable quantity of wind at times. Rain fell on six days.

### Fruit Forcing.

**CUCUMBERS.**—The latest plants which are to afford fruit about the new year and onwards should be placed out on hillocks or ridges, training with a single stem to the trellis, up which they may be allowed to extend two-thirds, when the lead may be pinched. Those not having the convenience of a Cucumber house may secure fair supplies of winter fruit by growing the plants in pots or boxes, and training the growths over the paths in stoves, fruiting Pine stoves, or other well heated structures. Plants in bearing should not be over-cropped, or the fruit allowed to remain longer than it is fit to cut, removing all deformed fruit in a young state. Maintain a night temperature of 70deg, 5deg less in the morning, 75deg by day, up to 85deg or 90deg with sun, admitting a little air at the top of the house at every favourable opportunity. The evaporation troughs should be charged with liquid manure, and the floor damped about 8 a.m. and 4 p.m., dispensing with the syringe over the plants. Reduce the supply of water at the roots, but not so much as to cause flagging. A little artificially compounded fertiliser sprinkled on the beds occasionally will benefit the plants through the waterings washing the elements into the soil. Keep the foliage thin and the glass clean, so as to secure thoroughly solidified growth.

**LATE GRAPES.**—Where the Vines were started in good time, say March, and aided in the spring by fire heat, as well as during the summer, the Grapes will be thoroughly ripe, in which state they can only be expected to keep satisfactorily, and the wood thoroughly matured; all laterals or sprays may be removed down to the main buds, ventilating freely on all favourable occasions. Fire heat will only be necessary to prevent the temperature falling below 50deg. Muscat of Alexandria and Canon Hall, the finest of all Grapes, however, mature better in a temperature of 55deg. To prevent dust falling on the berries raking or sweeping must not be practised. Mats or clean straw laid over the inside borders will to some extent prevent evaporation. Outside borders need not be covered where the soil acts like a sieve, but where composed of somewhat moisture holding material a covering against heavy rains is advantageous. Glass lights are best, wooden shutters good, and tarpaulin over dry bracken or straw answers well. A thick thatch of straw or bracken answers well. Where the Grapes are not yet ripe the temperature must not be less than 70deg to 75deg by day, and 65deg at night, falling 5deg through the night, allowing an advance to 80deg or 85deg from sun heat, continuing this until the Grapes are ripe, at least until the wood is brown and hard, for it is almost hopeless to expect good finish in Grapes that are not so by this time.

**MELONS.**—The end of the Melon season, as regards those grown in frames and pits heated with fermenting materials, is approaching, though fairly good fruit may be had up to November, especially of kinds that will keep for some time. Any fruits approaching ripeness should be cut with a good portion of stem, and placed in a house with a gentle warmth, where they will ripen, and be welcome additions to the dessert. From houses a supply of fruit will be kept up some time longer, the latest fruits only swelling now. Sufficient moisture will be secured to this crop by damping in the morning and again early in the afternoon, affording water to the roots moderately—a supply once a week will, in most cases, be sufficient. All superfluous laterals should be cut out, so as to afford the principal foliage the benefit of the autumn sun. Plants with fruit approaching ripeness should be kept dry, and a brisk heat maintained, with free ventilation, the temperature being kept at 65deg at night, 70deg to 75deg by day, rising to 85deg or 90deg from sun heat, affording a little air at the upper part of the roof whenever the weather is favourable.

**LATE HOUSES.**—October Peaches and Nectarines are quite as much valued as those of May, as they are fine in appearance, and when properly supplied with moisture and nutriment during the growing season, juicy and well flavoured. Sea Eagle is one of the best late Peaches, large, showy, good flavoured, with a juicy flesh, free of the stringiness and mealiness too prevalent in some late Peaches. Thomas Rivers also is a large, round, free-stone Peach, with a bright red cheek, firm flesh, juicy, and full of flavour. Lady Palmerston is also good in flavour, the fruit being large, greenish-yellow marbled with crimson, flesh pale yellow and melting. Victoria Nectarine attains to a large size, has a rich, sugary juice, and fine Stanwick flavour. As the wood in many late houses, especially unheated, is not too ripe, owing

to the dull and wet season, the house may be kept almost closed by day, so as to secure a good heat, admitting sufficient air to secure a circulation, continuing the ventilation at night. Any trees that have too gross wood should have a trench taken out as deeply as the roots, and about one-third the distance from the stem the trees cover of trellis, and left open for a fortnight, then filled in again firmly.

**STRAWBERRIES IN POTS.**—Where autumn and winter fruiting plants are grown they must, without further delay, be placed under glass and on shelves, so that they may enjoy a free circulation of air, ventilating so as to expel damp, as the fertilisation of the flowers is not satisfactorily effected in a damp atmosphere. Plants swelling and ripening their fruit in frames should have moderate ventilation, and though Strawberries will ripen at this season in cold frames, they swell better and the fruit is improved in a house where there is moderate moisture, and a temperature of 50deg to 55deg as a minimum, 70deg to 75deg as a maximum, by artificial means, in which they have air on all favourable occasions.

**PLANTS FOR NEXT YEAR'S FRUITING** are late, the crowns are not well matured nor so strong as desirable. Those intended for early forcing should be placed on a base impervious to worms in frames or cold pits, exposing them fully to every gleam of sun, employing the lights only to ward off heavy rains and at night when frost prevails. Keep the remainder of the plants in a sunny position, as they will require every ray of light and sun's warmth to enable them to mature the crowns properly.—ST. ALBANS.

### Kitchen Garden.

**PLANTING CABBAGES.**—The ground for the spring crop of Cabbage should be well prepared, but not too liberally manured. Though strong and vigorous growth is desirable, it should be dwarf and stocky in character, not large and succulent. This is a good time to place out the main crop of plants. Some may have been planted earlier, but it is not wise to rely altogether upon them, as they are likely to grow too large. Those pricked out in nursery beds are now of fair size and fit for final planting. Raise them with small balls of earth attached and plant in rows 2ft apart, the plants being 15in to 18in asunder. Some like to plant thickly at this season, say a foot apart, taking out every other one, either for early use or forming a fresh plantation in spring. This is a good plan if there is much demand for young Cabbage previous to its forming hearts. It may also prove very useful should there be a scarcity of green-stuff in early spring. Therefore, let a portion of the crop be planted thickly. All plants left in the seed beds are worth retaining, so thin out crowded and attenuated specimens, also weeds, the plants then remaining for probable use in spring. Dustings of soot may be applied, and frequent hoeings given.

**OUTDOOR TOMATOES.**—Fruits hanging on plants outdoors will scarcely do any further good towards ripening while remaining, so all should be gathered, green fruit as well as coloured. Those that have begun to colour will finish in a dry, warm place, while the small and green samples may be utilised for making into jam, so none need be wasted. A severe night's frost at this period will most likely destroy them, hence the importance of at once gathering them.

**LIFTING CARROTS.**—Roots having made full growth should be lifted and stored. If carefully loosened with a fork they may readily be drawn without injury. The leaves may be cut off several inches from the crown, and the roots exposed to dry air and sun, if possible. Failing this, dry them under cover. They can then be placed in a heap in a dry corner in a shed, covering with bags or straw. As a further protection, some may be preserved between layers of dry ashes or sand.

**ENDIVE.**—Seedlings should be planted out on a dry border. Full-grown plants may be kept some time in fair condition if damp does not attack them. If portable frames can be arranged over them where they stand, this will serve to keep them dry some time, or they might be lifted with balls of soil and placed in the frames. Blanch in the usual way, covering with pots or slates when the hearts are dry.

**LETTUCES.**—Good plants of Lettuce are invaluable at this time, and for longer if they can be preserved. Similar treatment as accorded for preserving full grown plants of Endive may be adopted for Lettuce. Damp alone is a great enemy in hastening their decay, but sharp frosts occurring when the plants are very wet will hasten their destruction. A specially tender place is the stem below the leaves. The plants must not be confined too closely in the frames, but air admitted freely. Winter Lettuce planted out in borders for standing the winter must be kept clear of weeds. Hoe lightly in dry weather.

**CELERY.**—The most favourable times for finally earthing rows of fully-grown Celery should be seized when the soil works dry and the weather is fine. The plants should have their leaf-stalks drawn closely together, and the soil, broken up finely,

packed carefully round. In finishing make the sides steep so as to well drain the moisture away.

**LEEKs.**—Fully grown Leeks may be further blanched by earthing the stems a little higher. Accelerate the growth of smaller plants by applying liquid manure. The will develop in size throughout the winter.—**EAST KENT.**

\* \* All correspondence relating to editorial matters should be directed to "THE EDITOR," 12, MITRE COURT CHAMBERS, FLEET STREET, LONDON, E.C. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense. In naming plants we only undertake to name species, or well-marked varieties, and only six on any one occasion. Florists' flowers we do not name.

**NORTHERN STAR POTATO (W. H. G.).**—We have no particulars of this Potato beyond those which we have given elsewhere. The price realised at auction implies a small quantity, working out at £850 per ton, or about 7s. 7d. per pound. This indicates a Potato craze equal to that obtaining for allotments or small holdings in the Spalding district of Lincolnshire, where the land let recently at auction for £5 7s. per acre. The "Gardeners' Chronicle" last week furnishes a history of the Potato.

**TECOMA SMITHI TREATMENT (Foreman).**—It is a greenhouse plant, and succeeds best in well-drained, loamy soil, and requires very liberal supplies of water during summer, but not needless and excessive supplies so as to make the soil sodden and sour. We advise that it should be kept moderately dry at the roots during the winter. The plant grows vigorously under ordinary treatment; but, in order to insure free flowering, the wood must be thoroughly ripened by being exposed to sunlight and air during the period of growth. It, like the other Tecomas, succeeds best planted out in a well-drained border, and not given too much root-room, otherwise it grows rampant, and produces flowers somewhat sparsely. This, however, depends on keeping the growths well exposed to light and air during the summer, and keeping cooler and drier in autumn and winter. A figure was given in our pages on May 2, 1901. It is grown in annual batches from cuttings, as a single-stemmed pot subject, at Kew.

**WINTER DRESSING FOR VINES (H. C. C.).**—1. The dressing advised on page 277, and applied at the rate of 4oz to 8oz per square yard, should not be repeated unless 4oz of the mixture was applied per square yard, then you may apply another dressing of 4oz per square yard as soon as convenient, or not later than the pruning of the Vines. You allude in your letter to dissolved bones and kainit, omitting the term refined, as employed by us to distinguish the difference between double sulphate of potash and magnesia and ordinary kainit, as the latter is a very inferior article, containing much less sulphate of potash and magnesia, viz., 23.60 per cent. sulphate of potash and 14.50 sulphate of magnesia, while the chlorine is very much higher, viz., chloride of magnesia 12.40, and chloride of sodium (common salt) 34.60. This article (ordinary kainit) we do not and did not advise for Vines or fruit trees generally, partly on account of its contained chlorine and sodium, and particularly because it does not contain half the amount of sulphate of potash and magnesia as the double sulphate of potash and magnesia (refined kainit), as given on page 277. Kainit or crude potash salts have special value for Mangold Wurtzel and Cabbages, also for mixing with new or raw turf in conjunction with basic cinder phosphate for forming compost for Vine borders, but for fertilising purposes the more concentrated forms of potash and phosphates are imperatively necessary to insure speedy and certain results, such as sulphate and muriate of potash and dissolved bones or superphosphate. On account of the magnesia in the double sulphate of potash and magnesia (refined kainit) we advise it for Vines in preference to muriate of potash. 2. The manure quoted on page 277 would answer for Peach trees, though for these and fruit trees and bushes we advise a mixture of nitrate of soda,  $1\frac{1}{2}$  part; dissolved bone-meal, 6 parts; high grade mineral superphosphate,  $3\frac{1}{2}$  parts; muriate of potash, 3 parts; kainit, 4 parts; wood ashes (un-leached), 2 parts, mixed, and applied in autumn, or not later than February, at the rate of 5cwt to 10cwt per acre,  $3\frac{1}{2}$ lb to 7lb per rod, 2oz to 4oz per square yard. This manure contains 1.9 per

cent. of nitrogen, 8 per cent. phosphoric acid, and 11 per cent. of potash. It is well adapted for use on Gooseberries, Currants, and all fruit-bearing bushes and trees; also for garden vegetables in connection with stable and farmyard manure.

**DEFINITION OF DOMESTIC SERVANT (A. C. D.).**—The words "Domestic Servant" apply to all persons employed in a domestic capacity in connection with an establishment where servants are kept, whether indoor or outdoor, male or female, hence stablemen and gardeners, head or under, are domestic servants, the question of living on the place not applying to those regularly employed. Hence you, as an under gardener, are a domestic servant. Of course, for excise purposes only, males are liable to duty, and this does not apply to helpers in stables or labourers in gardens living off the place.

**ASH TENNIS COURT (Alpha).**—There are two ways in which the ashes can be made to bind together. 1. Asphalt. (a) Take eighteen parts of mineral pitch and eighteen parts of resin, put them into an iron pot and place it over a fire, keep boiling for a short time, then add to it sixty parts of coarse sand, mix well together, and lay it on the path to the thickness of an inch, then sift a little fine gravel over it, and beat it in before the asphalt sets. (b) Take two parts of very dry lime rubbish, and one part coal ashes, also very dry, and both sifted fine. On a dry day mix them, and leave a hole in the middle of the heap, into which pour boiling hot coal tar, mix, and when as stiff as mortar put on three inches thick—the ground should be perfectly dry and beaten smooth—sprinkle over it coarse sand. When cold pass a light roller over it. In a few days it will be solid and waterproof. 2. Cement. The ground being made level, and three or four inches of rough material, but broken small, on top, put in, and well rammed, place on about  $1\frac{1}{2}$ in thickness of one part by measure of Portland cement and two of coarse sand and fine gravel mixed to a thin consistency with water. Before this coating has become thoroughly set, lay upon it a coating of Portland cement, mixed with an equal part of fine sand and  $\frac{1}{2}$ in thick in a mortar-like state, smoothing over. Or take equal parts of gravel, well screened, and clear road or pit sand. With five parts of the mixture of gravel and sand mix one part of Portland cement. Mix with water, and apply 2in thick. You may form a liquid of Portland cement and run it on the ashes. This would certainly cause the surface to bind, and being made smooth and even answer for a time. The better plan would be to add one part of Portland cement to five parts of ashes, and place on 3in thick. The ashes may also be treated with boiling coal tar, putting down 3in thick, the ashes being thoroughly dry. The smell of tar and of pitch is sometimes objected to, hence lawn tennis ground is usually cemented. So far as we are aware there is no better material for making the lines than liquid whitewash. Sometimes wood on edge is laid on the cement to indicate the lines, and these painted white, or kept white by timely attention by the chalk-marker.

**PLANT FOR PLANTING AGAINST A BARBED WIRE FENCE TO AFFORD A PAYING CROP (R. S.).**—As the position is exposed, we fear Raspberries would not answer, as they are liable to be much battered by strong winds; indeed, Raspberries naturally are coppice plants, where they grow in patches, and have a certain amount of shelter without overhanging shade. Unless very bleak the Raspberries might succeed, the fruiting canes being secured to the wires of the fence, and a strong-growing variety selected. Norwich Wonder, scarlet, fruit large and well flavoured, robust grower, is largely grown in field plantations, and is one of the hardiest, though perhaps excelled by Superlative, a robust grower and very heavy cropper, the canes, being stout and reaching to a height of 6ft or more, support themselves. The fruit is good either for dessert or kitchen purposes, being large, conical, and handsome, and the plant bears drought well, and the berry is not liable to mould or rot in wet weather. If you have command of both sides of the fence, this variety we advise, contingent on the position not being very bleak. Similar remark applies to Blackberries, the fruit being often small and battered by wind in exposed places. Unless very bleak, they do well. The Parsley-leaved, a strong grower and large fruited kind, is the best, and probably no plant gives such a large quantity of fruit. It is well adapted for a fence, being of climbing habit. By Hybrid Raspberry-Blackberry, we assume you mean the Loganberry, which bears very freely, treated like a Raspberry. The fruit is borne in clusters, and is long and dark in colour, being valuable for cooking or jam, and when black-ripe useful for dessert. Of its value for exposed places we have no experience. For a very exposed position no tree equals the Farleigh or Crittenden Damson, and treated similarly to a rough Thorn or overgrown hedge is an excellent and profitable barrier, as it bears enormously, is fine for preserving, and a very lucrative market sort. It should, however, only be planted where the owner or occupier claims both sides of the fence, and the position is not near a road or footpaths, for near these it is only growing for trouble and others' benefit, roadside planting being very delusive.

**GRAPE, MUSCAT OF AVIGNON (J. C.).**—We do not know a variety of this name.

**BOOK ON APPLE CULTURE (F. S. A.).**—You will find Mr. H. H. Thomas's "Book of the Apple" (John Lane, London, 2s. 6d.) a very helpful treatise.

**DESSERT PEARS FOR WALL FACING EAST IN ORDER OF RIPENING AND STEWING PEARS (New Reader).**—\*Clapp's Favourite, \*Triomphe de Vienne, \*Beurré Superfin, \*Louise Bonne of Jersey, \*Marie Louise, \*Durondeau, Beurré Diel, Van Mons Léon Leclerc, Marechal de Cour, Emile d'Heyst, \*Doyenne du Comice, Thompson, Passe Colmar, \*Gloû Morceau, \*Beurré d'Anjou, \*Winter Nelis, \*Josephine de Malines, and \*Bergamot Esperen. The dozen have an asterisk prefixed. Yes, there are twenty and many more really good dessert Pears, Comto de Lamy being the highest in quality of all Pears, and a sure cropper even in cold districts; and what Pear surpasses in quality the English raised Pear Knight's Monarch? Stewing Pears: Vicar of Winkfield, Bellissime d'Hiver, Catillac, and Uvedale's St. Germain. The trees for training obliquely, and planting 2ft apart, are best yearlings, dwarfs or maidens, and cost about 1s. each, or in case of double grafting, 1s. 6d. each. They should be on Quince or double grafted as variety requires.

**DISEASED CELERY PLANTS (P. D.).**—The portions of plant are infested by the larvæ of the Celery fly or Celery leaf miner (*Tephritis onopordinis*). The pest sometimes appears when the plants are quite small, but usually towards the latter part of summer, and eats out, more or less, the inner portion of the leaves, forming blisters, causing them to turn brown and often eventually to die away. The best and most certain remedy is to carefully look over every plant so soon as the small larvæ are detected, pinch off the affected part of the leaves and burn them, or destroy the insects by pinching the blister between the finger and thumb. If this method be followed from the first, at the same time keeping the plant lightly sprinkled overhead with soot, at intervals of a fortnight or three weeks, whilst damp with dew, the insects will not cause much injury; indeed, the procedure has given almost absolute immunity from attacks of Celery fly for many years. Probably spraying, or lightly sprinkling overhead, by means of a fine rose watering can with tar water is the best preventive of Celery fly. The tar water is prepared by boiling  $\frac{1}{2}$ lb of coal tar in two gallons of water for half an hour, or until it will readily mix with water, then diluting to 50 gallons with soft water. This prevents the fly depositing eggs, if not actually killing the larvæ in the leaves. As the plants are attacked for three or four months in some seasons, their destruction should be taken in hand immediately they are detected, or, better, take preventive measures in advance of attack. Paraffin emulsion solution is a good preventive and repressive application, spraying or sprinkling on the plants. As there are many pupæ in the diseased leaves these should be collected and burnt, and the ground where the Celery has been should, in due course, be deeply trenched or treated with gas lime.

**GROWING VEGETABLES FOR SALE ON A LARGE SCALE (W. G.).**—We do not know of any better plan to dispose of large quantities of produce than by arrangement with salesmen in the large centres of industry, such as the large cities and towns of Yorkshire, Lancashire, and the Midland Counties. Always have regard to distance of conveyance to market, often a matter of greatest importance, and ascertain what crops are likely to be most in demand, grow accordingly with the different requirements. Growers who do not do this, relying on the open market, very often do not realise enough for produce to compensate for salesman's charges and those for transit. We cannot give the values of crops, as they vary with season, demand, and supply. Besides, it does not do to "carry all the eggs in one basket," but growing crops suited to different seasons and in successional supply is more to the purpose, the crops following one another on the land, so that it is relatively never idle. This we have found the best plan, we having grown vegetables largely for the supply of the markets, and have only failed to secure good returns from the salesman when the market has been over-supplied or "glutted" with a particular produce, as is most commonly the case with "greens" during the autumn and winter seasons, the crops being follow-on, or "catch," and a glutting of the market is the consequence. Early Cabbages, early Potatoes, early Cauliflowers, and a successional supply of these with such crops as Peas, Runner Beans, Vegetable Marrow, Carrots, and Turnips, especially early, Onions, particularly main crop, Beet, and Parsnips, with, in some cases, Celery, early Lettuces, and, in most instances, Broccoli, are the crops that pay, even Jerusalem Artichokes bringing good returns. Asparagus is also a paying crop, and so also is Seakale, where means exist for blanching, and, of course, Brussels Sprouts are the staple green for winter, with good heads of Savoys. The chief point is to produce a superior article, everything of the best, and then the salesman has no difficulty in making satisfactory return.

**NAMES OF PLANTS.**—Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number. (W. S. H.).—1, Pavia, sp.; 2, Berberis nepalensis; 3, Hypericum Androsæmum; 4, Erigeron philadelphicus; 5, Aristolochia; 6, Abies Bungeana. (J. P.).—1, Tibouchina macrantha; 2, Calceolaria mexicana; 3, Phygelia capensis; 4, Bœhmeria nivea; 5, Polygonum Moly; 6, Pieris ovalifolia. (N. F.).—1, Aucuba japonica variegata; 2, Atriplex hortensis; 3, Azara microphylla; 4, Betula urticæfolia. (L. F.).—Catalpa bignonioides. (N. T.).—1, Tanacetum vulgare; 2, Cornus alba; 3, Adiantum Capillus-Veneris imbricatum. (M. N. O.).—1, Calendula pluvialis; 2, Lobelia tenuior; 3, Ipomœa Horsfalliæ.

**NAMES OF FRUITS.**—Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number. (New Gardener).—These are fruits of the Strawberry-Raspberry, they are not likely ever to find favour; yes, the Loganberry is an acquisition to the hardy fruit lists. (Prentice).—1, American Mother; 2, Egremont Russet; 3, Adam's Pearmain; 4, Lord Derby. (N. T.).—1, Pear Pitmaston Duchess; 2, Gansel's Bergamot; 3, Seckle; 4, Doyenné du Comice; 5, Apple Annie Elizabeth; 6, Newton Wonder. (A. B.).—King of the Pippins. (Disappointed).—1, Grape Golden Queen, it requires careful culture, especially towards the finishing off; 2, Pear Durondeau. (T. M.).—Grape Royal Muscadine, a first-rate early variety, and would succeed in your Hamburgh house. (H. W.).—Large yellow Apple is Yorkshire Beauty; the small one is Fearn's Pippin.

## The End of the Corn Harvest.

Before these lines will be in the hands of the reader we think that all grain crops, with, perhaps, the exception of those in His Majesty's kingdom far north, will be gathered in. Choirs will be practising ambitious anthems; well-known preachers will have been engaged for special services, and the local newspapers will be full of notices of harvest thanksgivings. We hope we may be able sincerely to offer thanks to the Giver of all good, but we fear throughout the length and breadth of the country there will be many heavy and sorrowful hearts.

We have been looking through many accounts of harvest—sent from all parts of the country, and we note that with the exception of the week ending September 19 the weather has been not exactly broken, but continuously wet. Heavy rains, heavy floods, heavy storms of wind—and one poor week of fine weather to set against it!!! We can contend with wet summers, cold springs, and unnatural winters, but we do hope for and need fine weather for the ingathering of the crops. There is a silver lining to every cloud, and we must be thankful for small mercies. Fortunately the weather has been cold, unusually so for the time of year, and hence there has been far less sprouted grain than we might have expected. Practically all is soft and out of condition, and it is only dire necessity that sets the threshing machine to work. Ready money must be had somehow, and thatch is needed quite as badly.

We think farmers this year will find another foe to face. The wet state of the country has driven rats from the land to the farm buildings, and they have already taken up their quarters high and dry and with storeroom at hand in the newly-made Wheat stacks. This has occurred in other unusually wet times, and rats have already been found in great numbers in the new stacks. It is not so much what they eat as what they destroy, but when the two are combined they levy a good percentage on the farmer's share. We cannot hope for great prices this season—condition is against it and of quality there is none. Whether quantity will in a measure make up for lack of quality is yet to be proved. It does not do to base the year's average on the first month's threshing yield.

A professor of great repute in the agricultural world has again been urging more corn, less roots, but surely, in the face of a season like the present he will have few followers.

We fancy, in spite of all the talk about enlarging our Wheat area so as to be better provided with food in time of war, the Wheat area next year may be considerably less. Another bad result of a late harvest will be the backwardness in sowing the crop for next year: there are great arrears of work to make up, and the days are appreciably shortening. We are not surprised to see that the value of English Barleys is some 2s. less than it was last year, this for the third week in September. The quantity sold was 5,977 quarters, as against 96,768 quarters of foreign, principally from Russia and Persia. These two countries supply us with a vast amount of grinding qualities. There is a good demand for foreign malting sorts, and it remains to be seen whether the foreign Barleys have suffered as much from the weather as our own. As far as we can see, Europe, as a whole, has experienced an excessive and prolonged rainfall. In France, Germany, Austria, and Hungary the crops have all been damaged.

We may be wrong in our surmise, but we fancy, with so much second-rate corn about and with the prospect, or, indeed, the fact of there being so many diseased Potatoes, there will be a great demand for pigs. Whether there will be pigs enough to "go round" is another question. We say advisedly diseased Potatoes, for accounts from all the great Potato growing districts are bad. When we consider how many hundreds of acres have been under water, the marvel is that there should be any good. Pigs seem to fatten on almost anything, but even pigs do better if the corn is of fair quality. They respond to generous treatment and give quick returns for a liberal diet.

Before we leave the harvest season of 1903 for ever alone we will just for a moment take a leaf out of Sir Walter Gilbey's book. Not a year passes but that excellent man pleads with a never-tiring zeal for a little help for those poor farmers who, having suffered shipwreck, are wearing out the remnant of their days in quiet backwaters, and finding it difficult to get the wherewithal for food and raiment. The Royal Agricultural Benevolent Institution does good work, and if only a little can be spared let that little be given without grudging, to bring some sort of ease and comfort to those who have seen better and brighter days. A little help is worth a great deal of pity.

### Small Holdings.

There is an association for the purpose of supplying at moderate prices small holdings to persons suited to their cultivation. Those who buy land are expected to pay down 10 per cent. of the price of the land (hitherto from £18 to £30 per acre), and the rest by half-yearly instalments extending over from ten to fifteen years, with interest at five per cent. N.B.: *No law charges.* Purchasers are required to reside on their holdings, and failing their ability to erect dwellings for themselves, the association will do it on the same terms as that on which the land is bought. The trustees are Sir James Blythe and Mr. T. H. Whitley, M.P., Professor Long managing director, Harold C. Long secretary. The first farm purchased (and that only a short time ago) was Cudworth, in Surrey, 367 acres, and of that already 200 acres have been sold. Cudworth is two and a half miles from Holm Wood station, and six miles from Dorking. The idea is to grow fruit both inside and out, and there will be much erecting of glass houses; poultry rearing, dairy work, fatted pigs will be among the objects attempted. As one might naturally expect, there has been a tremendous number of land applicants (1,040), many totally unsuitable people without the slightest knowledge of agriculture or horticulture and entirely without capital, and who fondly believed and hoped the association would lend money to take the holdings, and stock them for nothing!

The most likely people, we think, to get on and make a living will be those who have graduated on a farm—foremen and superior labourers, who have knowledge of technicalities, are not averse to hard work, and who, above all, have the necessary capital. It appears that on one holding of twenty-five acres two men who have bought the land conjointly have built their own cottages, at a cost of £220 each. One of the men who in early life was a farm labourer took up later with bricklaying, and he is responsible for the buildings. Handy men of this sort will always thrive. It appears there is a brickyard not far from the farm. London fruit-growers have bought several lots, and with management this land may be paying sooner than an outsider would expect. Strawberries planted now, if the plants are good and full of

fibrous roots, will yield some fine fruit next summer—quality if not quantity—and we fancy that forward Gooseberry trees would do the same. How the man with four children is going to make butter-making pay with seven acres passes our comprehension. We should not dare to undertake the job. There is one thing greatly in favour of this project at Cudworth—proximity to good markets, both London and local. In the report which we read the land is said on the whole to be good—loam over subsoil of weald clay. A similar enterprise was started fifteen years ago in Dorset by Sir Robert Edgecombe, with the gratifying result that only one of the thirty holders has failed to make his undertaking pay.

Cheshire, too, through the good offices of Lord Toller-mache and Mr. Tomkinson, has its small holdings, and the occupiers have done well.

It will be some years before any decided judgment as to success or failure of the Cudworth experiment can be pronounced. If the promoters exercise due care in their selection of occupiers, we ourselves should have no fear for the future. If they are hard-headed, practical men, they will choose such, and only such. Many a man in country districts has given far more per acre for moderate land, and then had all the expense of conveyance beside, and still made a living for himself. The difficulty is to get hold of suitable land without having to pay a fancy price for it. By "suitable" we mean of fair quality and not miles from everywhere. We were only speaking of a first-rate farm the other day which will be in the market shortly to a farming friend. He acknowledged all its good qualities, even praising it more highly than we, but wound up by saying, "How could anybody go and bury themselves in such an out-of-the-way spot?" There is a growing distaste to isolated farmsteads. The master and mistress find it lonely, and labourers are equally averse to banishment from village pleasures. Even good land and the promise of bumper crops will not tempt men to become (in a measure) modern Alexander Selkirks.

P.S.—We have just seen in a daily paper an account of extraordinary land letting in small lots near Holbeach. Here are men giving from £3 to £5 4s. per acre per annum! What a pity these men could not be put in the way of acquiring the land permanently at a moderate and reasonable rate. How is it possible to make a living and pay such enormous rents?

### Work on the Home Farm.

During the past week two items of interest have claimed all our attention, viz., threshing Wheat, and the Potato market. The latter is for the present quite disorganised; merchants are shy of buying, and the majority of farmers do not care to sell. The reason is not far to seek. The extreme moisture and warmth of the past fortnight have encouraged the growth of disease of a most virulent type, and the mischief has not only done immense damage, but is still spreading. Dealers will only buy by the ton, which does not suit farmers at present prices. Very few have been marketed, in fact the land is too wet for lifting at present. The haulm has died off so rapidly that lifting will become general as soon as the weather improves. All the less affected fields will be stored for keeping, for nothing but exceptional imports can prevent a high range of prices after Christmas.

Both Wheat straw and money were wanted, so the thresher has been at work, but the damp warmth has been unfavourable to good condition of the grain, which, though fairly dry, handles rather clammy. The price, 27s., is disappointing, still it might have been worse, and we are selling some water, at any rate. The conditions have favoured the ploughing of seed land, and except where late harvest operations have interfered there is little more to plough. As a fact, the area of Wheat after seeds is gradually diminishing as regards this district, as well as others we could name, and few farmers sow more than one or two fields, devoting the others to Potatoes, Oats, or Barley.

As Wheat invariably follows Potatoes, the Wheat acreage is fairly well sustained. Wheat is yielding well, which is encouraging to sow it, and our favourite variety, Squarehead's Master, will take a good deal of beating, but we have seen a small field of Garton's White Monarch, which has much taken our fancy, and if, when threshed, it fulfils expectations, we shall certainly give it a trial.

Lambs here are doing well, but we hear of serious trouble not far away. When a lamb is worth considerably more than a quarter of Wheat, farmers cannot afford to lose them. It is generally where sheep are most depended on that the greatest losses occur. Clover is plentiful, and nothing is better for lambs in autumn, especially when they are perforce on insufficiently ripe Turnips. Just now it is much cheaper than cake.

## PLANTING SEASON

## PAULS' ROYAL NURSERIES

WALTHAM CROSS, HERTS.

12 miles from London. South Entrance four minutes' walk from Waltham Cross Station; West Entrance three minutes' walk from Theobald's Grove; both Stations on the Great Eastern Railway.

## SPECIALITIES:

**ROSES** in all forms, from open ground and in pots. Gold Medals in 1903 from Royal Horticultural and Royal Botanic Societies.

**FRUIT TREES** for the Orchard, Garden, and Forcing House. Hogg Memorial Medal, 1901.

**HARDY TREES** for Streets, Parks, and General Planting. Silver Medal from Royal Agricultural Society of England.

**SHRUBS**, both Evergreen and Deciduous.

**CLIMBING PLANTS**, Hardy and Greenhouse.

**RHODODENDRONS, CAMELLIAS, & AZALEAS.**

**HERBACEOUS PLANTS** in great variety.

**BULBS and SEEDS**, and all Garden Sundries.

PRICE LISTS ON APPLICATION. INSPECTION INVITED.

Upwards of 1000 Medals, Prizes, and other Awards at leading Exhibitions during the past 42 years.

SOLE POSTAL ADDRESS—

WM. PAUL & SON,  
WALTHAM CROSS, HERTS.

Rose Growers by Appointment to His Majesty the King.

PRICE 10d., POST FREE.

WINDOW GARDENING  
FOR THE MANY

Or Instructions for Managing Plants in rooms throughout the year, with Special Directions for their Propagation and Culture.

No. 1216.—VOL. XLVII., THIRD SERIES.

For Present Planting!

CLIBRANS  
TREES & SHRUBS

WHY plant common Forest Trees in Gardens and Ornamental Grounds when so rich a choice of lovely Trees as those undernoted, with their varied habits, bloom, or foliage, are available?

**Acer dasycarpum** (Silver-leaved Maple), graceful habit, very ornamental, 7 to 8ft, 2/- each; 8 to 9ft, 2/6 to 3/6 each.  
**Acer platanoides** (Norway Maple), fine bold ornamental foliage, 7 to 8ft, 1/6 each, 12/- doz; 8 to 10ft, 1/6 to 2/- each, 15/- to 18/- doz; 10 to 12ft, 2/6 to 3/6 each, 24/- to 30/- doz.  
**Acer platanoides cucullatum**, a pretty and charming var., 8 to 10ft, 2/6 each, 24/- doz; 10 to 12ft, 3/6 each, 36/- doz.  
**Betula papyrifera** (the Paper Birch), a well-known elegant and graceful tree, 6 to 8ft, 2/6 to 3/6 each; 8 to 10ft, 3/6, 5/-, and 10/6 each.  
**Carpinus betulus** (Hornbeam), forms an excellent shelter for more tender species, 7 to 8ft, 1/6 each, 15/- doz; 8 to 10ft, 2/- to 2/6 each, 21/- to 24/- doz; 10 to 12ft, 3/6 each, 36/- doz.  
**Cerasus serrulata alba fl. pl.**, produces large drooping clusters of double white flowers towards the end of April, standards, 2/- to 3/6 each.  
**Fraxinus arbutifolia**, a distinct and handsome foliaged species, standards, 2/6 and 3/6 each.  
**Laburnum vulgare autumnalis**, an autumn-flowering variety, 6 to 8ft, 2/- each; 8 to 10ft, 2/6 to 3/6 each.  
**Laburnum vulgare Parkii**, the racemes of flowers measure 12 to 14 in. in length, 6 to 8ft, 1/6 to 2/- each; 8 to 10ft, 2/6 to 3/6 each.  
**Laburnum vulgare Mossii**, a remarkably free flowering variety, 6 to 7ft, 2/- each; 7 to 8ft, 2/6 each.  
**Negundo aceroides violacea**, the leaf-stalks are prettily coloured with a violet shade, 8 to 10ft, 2/6 each; 10 to 12ft, 3/6 each.  
**Platanus orientalis** (Oriental Plane), a majestic and graceful tree, 8 to 9ft, 2/6 each, 24/- doz; 9 to 10ft, 3/6 to 5/- ea.  
**Populus balsamifera trichocarpa**, long, oval, dark green leaves, vigorous grower, 6 to 8ft, 2/- each; 8 to 10 ft, 2/6 ea.  
**Populus fastigiata Wilsoni**, a neat growing variety of pyramidal habit, 7 to 8ft, 2/- each, 18/- doz; 8 to 9ft, 2/6 each, 24/- doz; 9 to 10ft, 3/- each, 30/- doz.  
**Pyrus aria** (White Beam), foliage bright green above downy white on the under side, 7 to 8ft, 1/6 each; larger sizes, 2/6 to 3/6 each.  
**Pyrus aria chrysophylla**, large silvery grey woolly leaves, 5 to 6ft, 2/- each; 6 to 7ft, 2/6 each; 7 to 8ft, 3/6 each.  
**Pyrus aria lutescens**, round, yellowish foliage, 5 to 6ft, 2/- each; 6 to 7ft, 2/6 each; 8 to 10ft, 3/6 each.  
**Pyrus sorbus** (Service Tree), a well-known hardy, free-growing tree, 7 to 8ft, 2/6 each, 24/- doz; 8 to 10ft, 2/6 to 3/6 each, 24/- to 36/- doz; 10 to 12ft, 3/6 to 5/- each.  
**Pyrus aucuparia asplenifolia** (Fern-leaved Mountain Ash), highly ornamental, 6 to 8ft, 1/6 each; 8 to 10ft, 2/6 each; 10 to 12ft, 3/6 each.  
**Pyrus aucuparia Fifeana**, of pyramidal form, producing orange-coloured berries, 8 to 10ft, 2/6 ea.; 10 to 12ft, 3/6 ea.  
**Pyrus aucuparia pendula aurea** (Golden-leaved Weeping Mountain Ash), standards, 2/6 to 5/- each.  
**Pyrus malus Parkmanii**, fl. pl., rich carmine, semi-double flowers, 4 to 5ft, 2/6 each; 5 to 6ft, 3/6 each.  
**Pyrus salicifolia pendula** (Weeping Pear), a graceful woolly-leaved tree, standards, 1/6 to 3/6 each.  
**Pyrus quercifolia** (Oak-leaved Mountain Ash), 8 to 10ft, 3/6 each; 10 to 12ft, 5/- each.  
**Quercus palustris**, a graceful cut-leaved Oak, 5 to 6ft, 1/6 each, 12/- doz; 6 to 7ft, 2/6 each.  
**Quercus rubra**, rich red foliage, 5 to 6ft, 1/- to 1/6 each; 6 to 8ft, 1/6 to 2/- each.  
**Robinia pseudo-Acacia** (Thorn Acacia, Locust Tree), produces racemes of white pea-shaped flowers, 6 to 8ft, 1/6 to 2/6 each; larger specimens, 3/6 and 5/- each.  
**Robinia pseudo-Acacia angustifolia**, a pretty narrow-leaved variety of graceful habit, 5 to 6ft, 2/6 to 3/6 each; 6 to 8ft, 5/- each.  
**Robinia pseudo-Acacia monophylla**, very distinct, leaves entire, not pinnate, 6 to 8ft, 2/6 each, 24/- doz; 8 to 10ft, 3/6 each, 36/- doz.  
**Tilia Europaea aurantia**, an Orange-barked Lime, 7 to 8ft, 2/6 each; 8 to 9ft, 3/6 each.  
**Ulmus campestris Dampieri aurea**, bright golden foliage, standards, 2/6 and 3/6 each.  
**Ulmus elliptica**, a free-growing species well adapted for towns, 7 to 8ft, 2/- each; 8 to 10ft, 2/6 to 3/6 each.  
**Ulmus montana Dovæi**, an upright vigorous-growing variety with large foliage, 6 to 8ft, 1/6 and 2/- each; 8 to 10ft, 2/6 each; 10 to 12ft, 3/6 each.  
**Ulmus montana macrophylla aurea**, a rapid grower with bright yellow foliage, standards, 2/6 and 3/6 each.

## Old-Time Gardening.\*

## The Early Florist.

HE labours of the florist in early times have been so completely overlooked that a chapter of this series must really be devoted to him. It cannot be exactly determined when he made his first essay in floriculture. Some authorities, indeed, would have us believe that he was an importation from the Continent, particularly from Flanders; but on close examination it is impossible to discover any well-marked deviation from usual gardening practices at the dates noted, flowers that are supposed to have been introduced by refugees having undoubtedly been in cultivation previous to their arrival in England. At the same time it is, I think, manifest that the early florist was indebted to the Continent for at least material to work upon. He had the improved flower—the Carnation, Tulip, Anemone, and Auricula—placed as it were in his hands, and for many years he was dependent on foreign aid for any improvement in varieties. That, I think, is abundantly evident from contemporary authorities. And I consider it not at all unlikely that the fact of there being florists at all was due to the enlightened policy of the English statesmen of the reign of Elizabeth, who made it possible for the plant lover to obtain flowers from all countries, and to secure the literature existing bearing on their cultivation. At any rate, it is clear the florist was an established type of horticulturist before the reign of that Queen terminated, while at its beginning he was an unknown quantity.

It is most unfortunate that none of the early writers on gardening, except Hill, who treats the subject in the most meagre manner, give any indication of a knowledge of florists' ways such as we find in, for instance, French books,

\* Continued from page 264.

READERS are requested to send notices of Gardening Appointments or Notes of Horticultural Interest, intimations of Meetings, Queries, and all Articles for Publication, officially to "THE EDITOR," at 12, Mitre Court Chambers, Fleet Street, London, E.C., and to no other person and to no other address.

and we have to depend on Parkinson for the earliest satisfactory account of the race. But, by the name of "Herboristes" Lyte indicates his existence fifty years previously, and there is little reason to doubt that the apothecary James Garret, as well as his son, was a florist in the true sense of the word.

One cannot be quite so sure of Mr. Nicholas Lete, or "Leete," as I have found it spelt. His position as a wealthy and highly esteemed citizen of London almost precludes the belief that personally he had time to work among so exacting a race of flowers as these; but no doubt the Tradescants, though gardeners, were imbued with the true spirit of the florist, and also Master Tuggye, of Westminster, whose collection of florist flowers was preserved by his widow after his death.

Master John Franqueville was another early florist who cultivated Anemones, and was the first to introduce *Rosa sulphurea* to gardens, though it was subsequently lost. His son was also a florist.

Then we know of a Master Bradshawe, and a Master Wittie, each as raisers and cultivators of Carnations. Evelyn's "Kalender" is largely, so far as it concerns flowers, devoted to what we should call special kinds, e.g., Hyacinths, Anemones, Ranunculi, Stocks, Carnations, Auriculas, and such like, and when Rea wrote his "Florilege" a year later, we find the reason in the vast number of varieties that were cultivated in all parts of the country.

It is a curious fact that the social and political troubles that convulsed England during a great part of the Seventeenth Century seem to have had no effect in lessening the enthusiasm of the florist, who, by the way, is first designated by that name by Rea. This gentleman introduces us to a number of the florists of his day, as, for instance, "that ingenious lover of these rarities, Sir Thomas Hammer." Then Mr. Rickets, of Hogesdon, near London, was not only a florist, but he was a nursery florist and a raiser in many sections, e.g., Gilliflowers and Auriculas. Of raisers of the latter he gives as many as sixteen names, without including himself. Among these it is not a little startling to discover "Mistris Buggs" and "Mistris Austin"! We find the name of Turner, a gardener, and of Mr. Jacob Bobart, of Oxford Botanic Gardens, as well as nurserymen and several clergymen, who have had a long love for the refined flower of the florist. Rea's son-in-law, Samuel Gilbert, seems to have been even a better florist than the old man, and he too was a clergyman.

It is too generally the opinion at the present day that all our florist's flowers are late productions, and that the early race of men and women who devoted their energies to the cultivation of these flowers are to be sympathised with for the quality of the material on which they had to work. There is no cause whatever for the indulgence of any such thoughts. Their productions may have been, and, indeed, were, in many respects different from those of the present time; but they had defined standards, they were continuously improving their flowers, and as with us, the fancy of one decade was the horror of that which followed.

With regard to cultivation, as an example, the "Willow" earth and the abnormal quantities of dung used in composts has often excited the surprise, and not infrequently the contempt, of moderns; but in the matter of these manurial earths we might well take a lesson from them. When used it was never less than two years old, and had been during that time most carefully prepared. Then, as to "Willow" earth, it was not by any means a necessity. Any kind of mould formed of decayed wood was esteemed, but none so highly as that of the Willow, which, it may be said, enjoyed a European reputation, and was, in fact, used by Continental florists before we find it mentioned in England.

The changes in a few years in these early florist flowers is very remarkable. Parkinson, for example, names very few old kinds; one or two Carnations, indeed, but the great majority were, when he wrote, recent introductions. Rea's flowers were quite a novel race, not only in the case of Carnations, but also Tulips; though there was less change evident in the case of other flowers, unless we include Auriculas, which had made great strides.

Carnation culture from this time, and during a long series of years, was a matter of extreme nicety. The florist cultivated almost solely a large flowered section, with "double pods," one flower only to each plant, and the greatest care

and attention was called for in preserving the earlier opened petals in condition till those in the second or inner pod were also expanded. In the case of the Auricula the advance was continuous. Most unfortunately, Rea determined not to illustrate his book, and we can only guess from his description what the flowers were like. Most were undoubtedly selfs; some were striped and a few double; but all alike were cultivated with much care.

Exactly the same thing happened with the Tulip. There were to be had, if they could be got, in great variety early in the century; but it is quite clear that from these a new type of flower was evolved, of which there were many hundreds of kinds in Rea's time. Dutch and French names jostled the vulgar English; for the florist of all ages lets not his national antipathies bewray his floral sympathies.

It is curious to remark the progress of the Carnation, which, by degrees, assumed the markings that continued for so long the distinguishing type of the florist varieties. This is the century (the seventeenth) of the earliest Picotee, as we recognise a type, with an edge of colour to a white ground, had appeared. It is noted by Gilbert in 1683, and was a purple edged flower. Shortly afterwards bizarres and flakes were recognised as types, and also Picotees.

The gardeners' societies that were first formed during this century exerted an unmistakable influence for good on flower culture. They can be traced backward, even in Scotland, well into the seventeenth century, e.g., that of Haddington, Aberdeen, and a wealthy one in Edinburgh. It is not at all improbable that these kept alive the interest in florist flowers which the constantly recurring vicissitudes in the fortunes of country gentlemen must have rendered almost impossible on their part to take any trouble with.

These societies, moreover, introduced the custom of showing flowers, which were brought to their stated meetings, examined by the members present, and, according to the qualities possessed, whether good or bad, condemned or established as varieties that had passed their examination with honour. They also, in their corporate capacity, introduced flowers from the Continent, which were distributed among their members; but the accounts of these transactions are so meagre that one has to trust a good deal to imagination, and believe that much good was effected in this way. Of course, in towns where nowadays there is nothing but houses and streets, there existed in these days well kept citizens' gardens attached to their houses, and in Edinburgh, the gardeners possessed within the city, land of their own.—B.

## Winter-Garden Structures.

A definition of "greenhouse" and "conservatory" has been given in the following lines: "In the greenhouse the plants are mostly grown in pots, and are portable; in conservatories they are planted out and are permanent." The greenhouse at Kew (which so many of our readers have seen and know) is typical of its kind. The whole year through it is kept furnished by flowering batches of pot plants, that are staged in massed groups of one sort, or at most, two together for either a contrast or a harmony; but none are mixed, as is almost the universal rule in the greenhouses of private gardens. Yet taste says that the massing system is best. Be that as it may, we need not stay to discuss it here; and we are reminded that the greenhouse, moreover, is the "growing-house" oftener than not in the private gardens, and "the conservatory" is the show-house. The definition we quote, therefore, hardly generalises correctly.

The true conservatory or winter-garden—when on a private estate—whatever be the form or size, should be attached to the dwelling house; and, indeed, it is robbed of half its charm and utility when it is separated. It may be said that its usefulness decreases as the distance between it and the mansion increases. In a public park the case is entirely altered, and the structures there should be suited to the surroundings and the accompanying circumstances.

This week, by the kindness of Messrs. Richardson and Co., the horticultural and heating engineers of Darlington, we are enabled to show two patterns of winter-garden conservatories, pages 360 and 361. The types shown are both very elegant, and we may be able to show interior views of these in a succeeding issue. It is at this season that the need for, and utility of, such capacious glass structures are seen and felt. We shall have occasion to return to this subject again.

### **Cattleya Dowiana Rosita.**

All who appreciate the richly coloured and elegant *C. Dowiana* will the better value a variety from it. In *C. D. Rosita* we have one of the best of its forms, and this came from M. Charles Maron, of Brunoy, France, some years ago, obtaining recognition at Westminster, when shown there, in the shape of a F.C.C. The stout sepals are soft cream, with a pronounced suffusion of rosy red at the tips; the broad, wavy, and somewhat fimbriated petals have a similar basal colour, but the rosy red is of a brighter shade, and is far more abundant. The superb lip is velvety crimson, while the golden lined throat has all the beauty of the typical plant.

### **The Week's Cultural Notes.**

*Dendrobium cambridgeanum*, or *ochreatum*, as it is also known, is a puzzling species to many who are growing it for the first time. It is never a very strong grower, and when the blossoms are past the pseudo-bulbs, or stems, often begin to wither rapidly in a manner very disconcerting to those in charge. But really there is nothing to be alarmed at in this, as when new growths push, the plant is in the habit of renewing itself rapidly. It is very erratic in its time of flowering, and I have seen a nice plant of it during the present week in full flower, quite four months behind its usual time. As with *D. chrysanthum* noted last week, the plants must be kept growing gently during winter, not rushed on in the insufficient light then prevailing.

Considering the dull season the popular *D. Phalaenopsis* has done remarkably well, though in many instances I have noticed a falling off in colour, due to lack of light to consolidate the growths. The winter's rest in a warm and moderately dry atmosphere will put things right, and we must hope for a better season next year. *D. bigibbum* has fared worse than its stouter growing compeer. Many of the spring flowering species are quite ready for the resting quarters, all the leaves having fallen and the stems being well ripened. Light, plenty of air, and a cool, dry atmosphere are now required.

In the cool house the pretty *Oncidium cheiroporum* is growing freely, and must not be allowed to become dry at the roots, though it is never a thirsty plant, liking a thin compost and plenty of air about its roots. Small wood baskets or pans for suspending suit it best, and all the year round a moist, mild, and airy temperature is desirable. Should the plant be in need of fresh compost it may be given at this time, taking care not to disturb the older roots much. It is one of the brightest and prettiest of winter flowering Orchids, and should be in all collections.

*O. concolor*, another small flowering beautiful plant, has finished growing, or nearly so, and will need less moisture at the roots, but not this or any of the spring bloomers must have so little that the pseudo-bulbs shrivel. The *O. macranthum* section comprising, besides the type *O. serratum*, *O. undulatum*, *O. superbiens*, *O. hastiferum*, *O. lamelligerum*, and others, must never be dried, as they require sustenance winter and summer, and are more likely to shrivel than almost any other species. Owing to their habit of growth, viz., one pseudo-bulb occurring a good deal higher than its parent, the new roots are exposed to insect attacks, and if any doubt about slugs or cockroaches exists a little peat and moss should be laid over them for protection.—H. R. R.

### **Orchids and Symbiosis.**

It is now well known to many that Orchids, for their successful rearing from seeds, do best when grown in association with older plants of the same family. Before this fact was recognised (says the "Gardening World") thousands, and probably millions of seeds were annually lost by sowing them on the surface of pots, like the seeds of annuals or perennials of more common kinds. M. Bernard has recently laid before the French Academy of Sciences the result of some of his experiments, by which he demonstrates that Orchids are unable to live unless certain microbes are present in association with the roots of the plants. Particularly is this the case with seedling Orchids making a start in life. We have seen large numbers of them successfully raised from seeds until the green was quite visible to the naked eye, after which they went off rapidly, when merely grown on pans of soil.

M. Bernard cultivated those microscopic fungi by themselves, and also Orchids apart from them, but the latter did not thrive until brought in contact with the former, after which the growth

of the plants became quite normal. Possibly, however, if all cultivators would take care to inoculate the soil in which they attempt to raise seedlings with some of that taken from pots of growing Orchids, success might become perfectly certain, even with seedling Orchids. Some of our expert Orchid raisers, however, succeed by slightly different methods, such as by sowing the seeds on a coarse kind of cloth on the top of pots or pans.

### **Cypripedium niveum at Highbury.**

This gem of *Cypripediums* (botanically *Paphiopedilum*) is grown very successfully in Mr. Chamberlain's garden. A note as follows, appears in this month's "Orchid Review": "The plant came here as newly-imported some four years ago, and is grown in the warm house, where it occupies a position at the warmest end, some 2ft from the glass roof. Two years ago it was placed in a 10in pan, well drained, in a compost of fibrous loam, sphagnum moss, and limestone, in equal parts. It is given abundance of water

during the summer months, and never allowed to become really dry in winter. With this treatment growth is luxuriant, the plant retains every leaf, and is the envy of every Orchid enthusiast."—J. MACKAY.

**Cattleya Dowiana Rosita.**

#### A Compliment to Cross Breeders.

The "Evening Standard" says: "The high prices paid for special seedlings lately have been a matter of profound surprise to those who are ignorant of the perfection to which the science of Potato culture has been raised. There would appear to be nothing to justify the payment of 28s. per pound, without some knowledge of the infinite patience and labour which go to the making of the costly blends which are so eagerly sought after. The process is tedious in the extreme, and the percentage of successful results very small. New specimens are being constantly developed, the process sometimes occupying years. To combine the qualities of flavour, size, and productiveness requires a nicety of judgment which can only be acquired by years of painstaking study. To many the cultivation of the humble root is as fascinating a pursuit as that of the Rose grower or the chicken fancier. It is by the work of these enthusiasts that the national crops are preserved from deterioration, and the ravages of disease and blight resisted."

#### Japan Plums.

*Prunus Simoni* and the *Kelsey* have given moderate satisfaction in California, but the American-Japan Plum, grown by Burbank, and bearing his name, leaves them all in the shade. It is a cross between *Simoni* and some hardy American sort. The size is phenomenal. No fruit in the New Orleans market makes a better showing than the Burbank Plum. It is the size of an average size Peach, with yellow flesh and small seed. The skin is smooth and free from blemishes. It is reported hardy as far north as New Jersey. Japan Plums all have a tendency to form broad, spreading trees. This can be obviated by pruning soon after the bearing season is over. Wide spreading limbs frequently break under heavy crops. Plums are stone fruits, and all such are heavy. *Kelsey* is smaller than Burbank, and of a greenish-yellow colour, to the uninitiated appearing to be unripe. In flavour it is excellent. It is one of the fruits frequently saved by smudging, as it blooms and sets fruit quite early in the frosty spring. The Japan Plums are wonderfully free from black knot, and from the attacks of the curculio. The trees are thrifty growers.

#### The Result of Disafforestation.

The tourist who travels in Greece, says a writer in the "Revue des Eaux et Forêts," is astonished at the dusty country which, formerly so rich, has become so poor. The divine Hellas never had a rich and fertile soil, but it was not a desert. We should say to-day that the Sahara is approaching, and that death reigns there. However, the Greeks will tell you that it was not always thus. The crafty Venetians were the cause of it. Having need of wood for the construction of merchant vessels, they persuaded the Greek peasants to cut down and sell the trees. "Cut down the trees," they said, "which are the haunt of sparrows which devour your crops. Cut down the trees, and you will be twice as rich by the gold which we give you for the timber and by getting finer harvests." The wood cutters felled the Oaks, the Olives, and the Laurels. Then the Turks passed through the country. Fires completed the work which the axe had begun. The sacred woods of Greece were converted into ships and smoke. The wood cutters, more than the Turks, had done irreparable mischief. Under a hot sun, the shallow soil cracked and became exhausted. The wind carried away as dust the ancient soil of Greece. The forests which formerly attracted the clouds and caused the rain to fall were no longer there; rain came no more. The springs dried up. An arid desert was created, and it will now be the work of centuries to resuscitate the country of Zeus, father of rain, and of Plato, father of ideas. The writer then goes on to explain that the same cutting down of the forests is going on in Corsica, and that the results will be the same as they have been in Greece.

#### An Amateur's Begonias.

I enclose a photograph of a group of Begonias, grown by Mr. C. E. Harvey, Rose Villa, Acocks Green, Birmingham, an enthusiastic amateur gardener, who cultivates well all things he can accommodate in his greenhouses. His employment requires him to leave home at seven o'clock each working day, and he returns at about seven in the evening, except Saturday, which is a short day. He does all the work himself in regard to potting, watering, and propagating; and his greenhouses always contain something interesting, and often exceedingly beautiful. Many of the Begonias are very fine specimen plants, measuring about 30in high, and nearly as much through. The best double flowers measure 5½in to 6½in in diameter, including the following varieties—Annie Peeters, Beauty of Belgrove, Bouquet Lumineux, Duke of Fife, Duke of Teck, Golden Ball, Paul Verlaine, Picotee, Souvenir de Pierre Notting, Lady Dorrington, Royal Sovereign, and Sir Trevor Lawrence. The largest single flowers measure 7in in diameter, the favourite varieties being Duchess of Leinster and La Candeur.—JAMES UDALE. [A pleasant note, and a happy one. We wish Mr. Harvey still greater success, and hope to hear of him again. The photograph, unfortunately, would not have reproduced successfully.—Ed.]

#### House and Church Decorators.

An excellent and suggestive lecture (reports the "Yorkshire Post") was given on Saturday night to the members of the Leeds Paxton Society by Mr. J. Turton, of The Gardens, Becca Hall, on decorations for houses and churches. Mr. Turton, who is well known as a successful floriculturist, has had great experience in this kind of work, and his hints were of a thoroughly practical nature. The defect of most of the floral decorations that one sees is that they are too stiff and formal, and Mr. Turton pleaded for greater breadth and freedom of arrangement. With regard to materials, he called attention to the excellent effects obtainable by the use of good tall Palms, Dracænas, and Bamboos, and evergreen shrubs, such as Hollies, Yew, Box, Cupressus, and Tree Ivy. Berries from the wild Rose, in conjunction with Virginia cork, are useful for hiding pots, &c., and screens well draped with flowers and foliage look well. Tin troughs containing sand and water, and filled in with choice flowers look nice, and arches made of strong wire form useful foundations. Warm, rich colour can be obtained by the use of the berries of wild fruits. In church decoration he especially counselled his hearers to avoid repetition of effects. Mr. Turton also gave some very practical hints respecting the decoration of tables, rooms, &c.

#### *Osteomeles anthyllidifolia*.

This plant is not regarded as quite hardy, says the "Gardening World," but there is a fine specimen of it against a south wall in the Royal Gardens, Kew, where it has stood for some winters uninjured. The narrow, pinnate leaves are of a rich dark green, and cover the wall in a manner quite different from most shrubs usually employed for that purpose. The flowers are succeeded by berries resembling those of a Hawthorn or Cotoneaster, but having longer stalks, so that they are more or less pendent from the short leafy spurs. The species is a native of India, China, and the Pacific Islands. The native habitats do not augur much for the hardiness of the plant, and that may account for its being included in the "Handlist of Tender Dicotyledons," but, judging from its past behaviour, I should think, says the writer, it is hardier than it gets credit for. The evergreen leaves are the strongest argument against this idea of hardiness, but provided it is planted against a wall in a sheltered position it may yet prove worthy of more extended cultivation on walls in prominent places near the doors of dwelling houses on account of its beautiful foliage and red berries. At least one other species is in cultivation, but eight of them are known to science. Curiously enough, only one of them is native to the Old World, namely, that under notice, the rest being natives of the Andes of South America. The plant described in this note is the only one having pinnate foliage, so that it may be taken for granted it is the best and most handsome for garden purposes. Some of them are trees, the rest being branching shrubs, of which *O. anthyllidifolia* is the most graceful.

### Rose Jottings: Varieties, and What Not.

I am about in time, I expect, Mr. Editor, to offer the benefit of my long experience to your readers who are thinking of sending their orders to our professional brethren, except, perhaps, in the case of those early birds (and, undoubtedly, they are right) who, by applying in good time, secure the worm, in the shape of the best plants, and for certain all the varieties they order.

A fortnight hence, more or less, according to the weather we have, will be quite soon enough everywhere to move plants, so unripened and succulent as the wood must be. I am the more tempted to mention the varieties I have myself found most useful to the exhibitor and public generally, from the revolution that has taken place, during the last few years, in the gradual displacement of the H.P.'s by the H.T.'s, as noticed lately in your Rose issue. Nevertheless, I venture to predict that a goodly number of the old H.P.'s, especially the dark varieties, will hold their own for many a long year.

It is interesting to notice how hardy the H.T.'s are already. I can point to Kaiserin Augusta Victoria, Viscountess Folkestone, and Mrs. W. J. Grant as instances, from several specimens I have in different parts of my garden, on large bushes in superb bloom, with well ripened wood.

It is astonishing what delusions some people labour under, especially among my unsentimental sex, in Rose lore! I was dining at a table d'hôte in South Wales the other day, when across the table there reached me a fine manly voice (which I heard afterwards proceeded from a distinguished general) expressing his opinion that "He had quite given up all interest in Roses since, of late years, all the perfume had been bred out of them!" Now, I appeal to the public as to whether such an assertion is a fact, or whether the exact reverse is not the true state of the case? Is it not rather to the infusion of Tea "blood" that the H.T.'s, or the greater part of them, derive their delightful fragrance? To give two especially noticeable instances I would mention Mme. Abel Chatenay, and the new Robert Scott; of the latter of which our American cousins may be justly proud. Subjoined I give a list of (1) H.P.'s which will in all probability hold their own; and (2) of H.T.'s which are most to be recommended.

H.P.'s: Alfred Colomb, Mme. Rothschild, Ben Cant, new, too robust for present wet season; Capt. Hayward, blooms early and late; Dr. Andry, Duke of Edinburgh, Dupuy Jamain, Etienne Levet, Frau Karl Druschki, everybody's Rose; Général Jacqueminot, Mme. Gabriel Luizet, Marquise de Castellane, Merveille de Lyon, Mrs. R. G. Sharman Crawford, superb this year; Ulrich Brunner, and Ulster.

H.T.'s: Antoine Rivoire, Bessie Brown, wet season spoils; Caroline Testout, indispensable to breeder, exhibitor, and every class of grower; Countess of Caledon, robust, grand flowerer; Gladys Harkness, Irish Glory, delightfully bright; John Ruskin, Kaiserin Augusta Victoria, Killarney, Lady Clannorris, La France, Mme. Abel Chatenay, Marjorie, small, but charming; Marquise Litta, Mildred Grant, season adverse; Mrs. W. J. Grant, Robert Scott, White Lady, and Viscountess Folkestone, which is indispensable.—HEREFORDSHIRE INCUMBENT.

### American Roses.

I was greatly interested in Mr. Raillem's note on page 260, September 17, on American Roses; and I presume that he is aware that practically every Rose in America is grown on its own roots, both indoor and out. The amateurs root the cuttings under handlights, jam-jars, &c., and having had good results from such methods in this country, I can recommend the plan. The American nurserymen, however, strike in houses and pits, not cool pits, but those with hot steam pipes running through the beds. The manner in which they turn out Roses is astounding, for one can buy little plants 6in high, out of pots, for three cents. These bushes when received are potted and protected for awhile, and then planted out, and it is a sorry garden that has no Roses during the season. I myself this year have seen grand blooms of Bessie Brown, J. B. M. Guillot, Mme. Pernet Ducher, and others, on plants that were cuttings last October, and rooted under a jar. The bushes are now 1ft high, with thick, strong shoots.

As Mr. Raillem remarks, the American marketmen cut their blooms and throw out the plants; and does it not seem better to raise Roses in such a manner? Why, it is like growing double Primulas. Respecting Meteor referred to, it is claimed to be the finest crimson Hybrid Tea in the United States; and there is also a climbing sport from this variety. I cannot find any reference to the double Fortune's Yellow as grown in California at the moment, but Lamarque, Solfaterre, and Perle des Jardins are exceedingly popular.—A. W.

### Rose, Meteor.

This Rose is well-grown at Waltham Cross. We were much impressed by the all-round merit of the variety. First of all it is vigorous and thrifty; the wood and foliage are such as to inspire confidence in the minds of even inexperienced cultivators of pot Roses. The flowers, too, are large and well built, and we write from knowledge of the variety as seen in the middle of September. Mr. Wm. Paul omits a description of it, however, from his list in the tenth edition of "The Rose Garden." What its failings are (if any) in this country we must leave for others to relate, but at present we have a pleasant reverie of its thick-petalled, rich purple-erimson blossoms, so freely borne.

### Sir William Jackson Hooker.

(Continued from page 335.)

#### II. GLASGOW, 1820-1840.

"Early in February, 1820, my father was appointed by the Crown to the Chair of Botany in Glasgow, and having despatched his library, herbarium, and household effects to London, to be thence sent by smack to Leith, and on to Glasgow by canal, he severed his connection with Halesworth and the brewery. In May he presented himself before the Senate of the University, who gave him a flattering reception, read his inaugural thesis (the Latinity of which, thanks to his classical father-in-law, was highly praised), and was duly installed, with the welcome addition of having the honour of LL.D. conferred upon him.

"Before enlarging on my father's success as a lecturer, I may premise that the teaching of botany in the first quarter of the last century was very different from that which now prevails. It was regarded as ancillary to that of Materia Medica, and as a means of enabling the practitioner to recognise the plants used in medicine when there might be no druggist to appeal to. Furthermore, it was required by the principal examining bodies for medical degrees or licenses that the candidate should have attended a course of lectures delivered in a botanical garden registered for the purpose; and in these gardens the plants were invariably arranged according to the Linnean system, which consequently had to be taught. . . . Throughout the course my father's artistic powers were exercised with chalk and the blackboard; and he gradually accumulated a magnificent series of folio coloured drawings, especially of medicinal plants, which were suspended in the class-room as occasion required. I well remember the murmur, and even louder expressions of applause, with which he was greeted on taking the chair, when the number or interest of these pictures was conspicuous. Before his second year's class had assembled he had published the 'Flora Scotica' for its use, and an oblong folio of lithographed illustrations of the organs of plants by his own pencil, with twenty-four plates and 327 figures, a copy of which was placed before every two students.

In the course, three excursions were taken, two in the neighbourhood of Glasgow, and one towards the end of June, of five or six days' duration, to the Western Highlands, usually to the Breadalbane range. This latter was eagerly anticipated by a contingent of ten to thirty students, amongst whom were frequent accessions of botanists from Edinburgh and England. Further, to stimulate their zeal, he habitually invited the more industrious students to breakfast with him after the class (which was from eight to nine a.m.), when he would show them books, and give them, from his store of duplicates, specimens of rare British plants. To conclude this episode of his life, it must be recorded that his success as a lecturer was phenomenal; his tall figure, commanding presence, flexible features, good voice, eloquent delivery, and urbane manners, are vouched for in every obituary notice of him. His lectures were often attended by gentlemen of the city, and even by officers from the barracks three miles distant. The students of his first year's course presented him with a handsome silver vaseulum, chased with a design taken from the Moss Hookeria lucens, and those of the second year with a richly bound copy in ten volumes of Scott's Poetical Works.

Except for visits to London, Yarmouth, or the Highlands, botanising with Greville or Arnott, and once to Paris, he rarely left home. He was at his desk with pen or pencil by eight a.m., and never left it much before midnight. The late summer and autumn weeks were frequently passed with his family at watering-places on the Clyde, usually at Helensburgh, where he enjoyed the society of two neighbours of scientific tastes and culture, James Smith, Esq., F.R.S., of Jordan Hill, and Lord John Campbell, afterwards Duke of Argyll, father of the late Duke, who inherited his parent's scientific tastes. In 1837, he purchased a cottage with an acre of ground, 'Inverreck,' near Kilmun, on the Holy Loch; a lovely spot where he could indulge his fondness for gardening. In the touring season he received many English and foreign friends who took Glasgow on their route for the Highlands, both to visit him and to avail themselves of his experience of roads, conveyances, and accommodation.

(To be continued.)

### Strawberries in October.

Late in August an invitation was received at this office from the Rev. A. Foster-Melliar, M.A., Rector of Sproughton, near Ipswich, in Suffolk. Mr. Foster-Melliar is far better known to Journal readers as the master Rosarian who writes above the pseudonym "W. R. Raillem" but he has other loves besides the Roses; and his letter on this occasion said: "Come and see my Strawberries." This was a bad shot, for we are strong in the fashion here, and take our holidays in August.

I had been almost within sight of "John o' Groat's Hoose," up among the Hielan' hills, with their caps of snow and robes of purple, and had hardly come back to the desk once more (and this was now late September) when once again came the kindly cry: "Come and see my Strawberries." It was a Friday, and within twenty-four hours I had both seen, admired, and tasted the fruits of a crop such as I never have seen equalled anywhere. I must be cautious in the use of figures, else my very truthfulness will foil my purpose. But the figures can stand for a moment.

Strawberries in October? Yes. St. Joseph Strawberry; St. Antoine de Padoue; and La Constante d'Automne: these are the varieties. Quietly Mr. Foster-Melliar led the way through the poultry yard with its perky, beautiful black Minorcas and sturdy Leghorns, to a gate that leads to his garden of specialities; and as we paced the path, he chatted of the Apples, and was glum over the failure of his Cox's Orange Pippin trees in all parts of the garden. Do as he may, the trees will rust and always fail.

But now we are at the Strawberry bed: the new plantation that was made early in August. Already one notes exceptional methods of treatment, the plants are a yard apart either way—a yard from row to row: a yard from plant to plant. These young Strawberries will yield fruits next summer. Five, or six, runners will be chosen from each of them, and made to root around the central parent plant in the way I try to show by the agency of the printer.

Fig. 1.—The parent plant with five runners around it.

Fig. 2.—The parent removed later in the year, leaving a circle of plants.

Figure 1 is intended to show the position of the central plant and its runner plantlets. Figure 2 shows the parent removed from the centre, leaving a large circle of plants formed by the now developed offspring. The reasons for taking away the original plant are to allow freedom of air and light, for the plants develop so well and bear such heavy crops that this excision is imperative. Furthermore it allows a space for the foot, there being also a tiny alley between the rows.

The facts so far are: 1, the plants put in this summer are 3ft apart; 2, they yield fruit next year; 3, the runners, with the exception of five or six, are scrupulously pinched off; 4, those chosen form a circle round the parent; 5, the parent is dug out at the end of the season; 6, the runners or plants are left to form a plantation which lasts three years.

Culture? Mr. Foster-Melliar has no secrets: he cultivates carefully and assiduously; treats his ground to good doses of manure from the farmyard, and as his soil is light, it can take as much as he can afford; and lastly, muscle is expended in spade work. But I must not forget to say that he is a great apostle for the thrifty use of the Dutch or the Sproughton hoe, the latter an invention of his own, and which many of our readers probably employ. A Sproughton hoe is the constant companion of the

veteran cleric and gardener, as he stalks across his lawns or amongst his fruits and Roses, taking the "legs" from a Groundsel here, or shuffling off a Plantain there—and it is the best of staffs!

Only twice this year did Mr. Foster-Melliar supply liquid manure (or wash) to the Strawberries; and as the weather was rainy, it was given without being diluted. A mulching of short manure is given very early in spring. In order to hold up and protect the weighty yield of fruiting trusses from dampness and dirt, the Rector of Sproughton employs stout wire, like telegraph wire, a quarter of an inch in thickness, and bends it to form a circle, the ends being turned down and fixed in the ground. It is like the accompanying diagram; and, of course, the trusses have every chance to ripen. Home-made supports of this sort are perfectly effectual, and are cheaper than any other. The making of them might furnish work for the garden-men during the dull days of winter.

Mr. Foster-Melliar made no complaint against the slugs; but bees and wasps are a sore trial, and for them he places little pots containing beer and treacle. These interesting but harmful insects will leave Peaches and come to the Strawberry beds the moment the odour of the latter reaches them. In order to make sure doubly sure in protecting the fruits of his labours from the larger birds, he has made moveable frames, each 5ft broad and over 6ft high, covered with small meshed wire-netting. The advantage of these frames is, of course, that they can be separated and again pieced together when a new plantation has to be covered.

It only now remains to say that the system he adopts, and the varieties he so manifestly favours (there being no others than those named in his garden) amply repay him for his pains and his choice. *Every day since June, for the last three years, he has been able to pick a dish of Strawberries; and the bed is very little larger than the floor space of a gardener's cottage.*

In late September he could pick many dishes, and the fruits were first-rate. They were all as large as an average Vicomtesse Hericart de Thury, firm, sweet, and juicy, and coloured to perfection. Constante d'Automne we both agreed upon as being more saccharine and richer than St. Joseph, though the latter is an exceptionally free cropper. Choosing the best looking plant I saw, I counted twenty individual trusses, and each truss was laden with ripe and ripening Strawberries, while the tips were profusely flowering. The Ipswich Gardeners' Society as a body, have paid a visit since I was there, and possibly some of them may support me in saying that a finer Strawberry display could not be seen. Twice Mr. Foster-Melliar has tried to photograph the bed, but neither time was successful.

The St. Antoine de Padoue is grown in a bed by itself. The plants became a prey to leaf-spot disease, which formed confluent patches. This variety is far softer in leafage and growth than the other two; it grows rampantly, but is susceptible to attacks which the others resist. What was to be the cure? Through this journal the owner had advice from Mr. George Abbey, who advised that a thin coating of straw be spread over the plants, and be set on fire. This was to destroy the spores of the Sphærella, even though it consumed some of the leaves. The advice was followed. They were burnt last July, and in two days new leaves were vigorously asserting themselves. Seen at the end of September with large fruits and a superabundance of foliage, one would never guess they had had such a drastic check.

Mr. Foster-Melliar would like to see this variety crossed back upon St. Joseph, as he affirms (which is substantiated by his plants) that it is losing the Perpetual character. Notwithstanding the victorious combat of the leaf-spot in July, the new foliage is flabby and soft, and the watchful cultivator shook his head, saying, "They'll soon fall a prey again," and the warm, damp weather will doubtless have tended to bring about a recurrence of the trouble.

Notwithstanding the paragraphs about Strawberries in all the newspapers during the last fortnight, it is hardly likely that market men will devote themselves to any considerable extent to the culture of autumn-fruiting Strawberries. The seasons are too risky; and a single sharp frost, or half an hour's hail, or dripping and cold days would almost spoil all their chances of profit. There is, too, quite a goodly selection of other fruits on the market at this season, and these claim the public palate. But far more I think might be done in private gardens. We go to great lengths in order to provide forced Strawberries in February and March; why not have them also in October?

The story of Linnæus having cured himself of gout by subsisting for six weeks on Strawberry fruits may be true, or it may not; just as the other story of a man who journeyed

to Southampton at the beginning of each Strawberry season, and shifted his ground northward as the Strawberries gave way at the south, in order to enjoy the longest possible season, may also be fiction, but there are none of us who do not love an odorous, melting, sweet and briskly-flavoured *Fraisier*, as the French name it. The Latin, or generic, name is *Fragaria*, and it is interesting to note that the Highland clan name "Fraser" comes from this. The Perpetual Strawberries are the outcome of crosses with *F. tardissima* and varieties of the Perpetual Pines, Hautbois, and Alpines.—J. H. D.

### Vines in Pots.

Well managed Vines in pots produce useful Grapes, and often better than Vines planted in borders, from the conditions of culture being more favourable. This is the case where the Vines are given bottom heat. To insure success the canes must be strong, thoroughly ripened, and duly rested.

As a start must be made about November 1 to have ripe Grapes in March or early in April, the tree-leaves and litter should be in due course of preparation for affording a mild, sweet bottom heat. The heat about the pots should not exceed 65deg at the start, bringing up the fermenting materials to the level of the pots by degrees, so as to augment the temperature to 70deg to 75deg by the time the Vines are in leaf.

Any Vines in pots for starting later should be placed under cover, an open shed with a north aspect being suitable, but the pots must be protected with dry hay or straw, and mice and rats kept down, or the animals may render the Vines useless by girdling them at the collar.—A.

### Cherry House.

A structure devoted to Cherries is not common, and is remarkable, as no fruit proves more useful for dessert in the spring. The house for Cherries should be light, well ventilated top and bottom, and efficiently heated. A lean-to or three-quarter span facing south is most suitable for early forcing, say to have the fruit ripe in April, or a span roof with the ends north and south for affording fruit in May and June. The trees may be trained to a trellis fixed 12in from the glass, border inside, and not made all at once. A 4ft to 6ft width of border, according to the size of the trees, is sufficient to commence with, draining it with rubble 9in deep, and on that a 3in thickness of old mortar rubbish. From 20in to 24in depth of soil is ample, but deeper at first to allow for settling. Good turfy loam, preferably rather strong, with lime rubbish from an old building one-fifth, and a sixth of road scrapings, form a suitable compost. The trees may be planted as soon as the leaves fall. Those trained to walls four to six years, and in a fruitful, healthy state, also recently lifted so as to bear removal safely and without check, are the most suitable. The border being put together compactly, and the trees firmly planted, following with a good watering, and mulching with stable manure, duly sweetened and about 1in thick, will give a fair crop the first season. The most suitable varieties are Early Rivers, Governor Wood, and Black Tartarian. The roof lights should be taken off and remain so till the beginning of next year.

Cherries are readily forced in pots, and give a long succession of fruit. The house may be heated for forcing, or a cool one, well ventilated, and as the trees ripen their crops they can be placed outdoors. The trees should be secured at once. In potting, it is necessary to provide good drainage, and ram the soil firmly. Trees that are in as large pots as desired need only have the drainage rectified and the surface dressed, or the drainage may be cleared away, a few inches from the base removed, the roots shortened back, and fresh soil given as advised for borders, with a fifth of well decayed manure, removing also the loose surface material and supplying rich compost. For forcing in pots, Early Rivers, Belle d'Orleans, Empress Eugénie, Governor Wood, Black Tartarian, Black Eagle, Elton, and Mammoth are good. For a cool house, Belle d'Orleans, Early Rivers, Early Red Bigarreau, Empress Eugénie, Bigarreau de Schrecken, Governor Wood, May Duke, Black Eagle, Archduke, Nouvelle Royale, Florence, and Late Duke. These are compact growers, and the following large growers: Early Jaboulay, Black Tartarian, Bohemian, Black Bigarreau, Elton, Reine Hortense, Bigarreau, Bigarreau de Mezel, Mammoth, Duchesse de Palluau, Bigarreau Napoleon, Belle Magnifique, Tradescant's Heart.—G. A.

### Border Carnation, Mrs. Lora Armstrong.

During the period of the open-air display of Carnations this year, we were favoured by the introducers of this new Carnation with a beautiful posy of the richly distinctive flowers. Now we are able to represent in print, a photographic reproduction of the variety, and we might again remark that this is one of the most handsome Carnations we have lately handled. The smooth-petalled, strongly-built flowers are a rich brick-red salmon, and delightfully scented. The raiser was Mr. J. Dowling, gardener to Mrs. Lora Armstrong, Carrickmines, and the introducers are Messrs. Wm. Watson and Sons, Clontarf Nurseries, Dublin. It has been certificated both at Glasgow and Dublin.

## Potato Challenges.

The Potato market has been distinctly excited during the past few weeks. The world has been startled by the vigorous booming of new varieties, reports of fabulous prices, and prophecies in regard to yields which have fairly taken away the breath of the old-time farmers. When a Spalding tradesman can command £20 a stone for Potatoes, as has been done on more than one occasion recently; when, in a specially trying season, it is demanded for a new Potato that it is absolutely disease-resisting; when, in a single week, there appear three separate challenges in connection with three different varieties of Potatoes; when there are all sorts of rumours of extraordinary yields and of huge profits made by raisers, it is not at all surprising that more than ordinary curiosity is excited.

So important have been the Potato developments in this (Spalding) great tuber-producing district of late, that during the past week or two experts and large growers from all parts of Great Britain have been visiting the district, and instituting inquiries on the spot. Not only so, but these gentlemen meant business, and they have been keenly struggling one against another to capture large acreages of the Potatoes grown here—

From a photo.

Watson &

### Border Carnation, Mrs. Lora Armstrong.

about. The chief point of controversy, however, has been—Which of the new varieties is the coming Potato? Which will last longest, go the farthest, pay the best?

Interest amongst Potato growers reached fever heat when there appeared three challenges, the Potato championed being the Northern Star, the Evergood, and King Edward VII. We are not experts; and, where these gentlemen differ so widely, as is shown by the letters received by the Editor, we are not inclined to dogmatise. One thing is quite clear, however, that in the test which was applied last week, the Evergood scored triumphantly. Mr. W. J. Atkinson, of Weston, gave a fair challenge, and what was the result? That in this treacherous year, when so many acres of Potatoes are blighted, in 11½cwt. of Evergood Potatoes dug in a single field, after the most careful scrutiny, less than 2lb of blights were discovered. The challenges were the talk of the Corn Exchange at Spalding on Tuesday; the result of the Evergood test was the one theme in agricultural circles on Wednesday, and in subsequent days of the week.

Lincoln is the champion Potato growing county; 71,575 acres being planted this year, and the largest proportion of these are grown in South Lincolnshire. To this district, therefore, the question of great moment is: Which is the safest, soundest, and most profitable Potato to grow? The more discussion and experiment we have, the more likely are Potato growers to secure a satisfactory answer to their inquiry. ("The Lincolnshire, Boston, and Spalding Free Press.")

### Hints to Exhibitors.

Exhibitors are deserving of much consideration at the hands of officials, as they are really those who make a show what it is—good or bad. Exhibitors are in some instances far too grasping, they attempt to compete at too many shows and in too many classes, and thus reduce the standard of quality in an exhibition and their own reputation as well. There are many who prefer several third prizes to one first, even in minor classes, if the amount in prize money exceeds for the thirds that of a single premier award by a few shillings. Some exhibitors think little of being beaten, but such is not the spirit that should dominate the heart of an exhibitor. It cannot but be displeasing to employers to find their name placed behind that of another exhibitor with far less facilities for producing superior exhibits. The aim of all exhibitors should be to strenuously gain first prizes, restricting the number of entries at one show to gain that object.

I have seen men adopt the shifting tactics at an exhibition (when they saw their opponents' blooms staged) in such a manner as to spread their chance of winning prizes over a larger area until they had to be content with the winning of one single first, and acknowledging themselves content with numerous inferior awards.

Exhibitors are solely responsible for the class of bloom exhibited. It is pleasing to note that there is not nearly the tendency nowadays to stage blooms remarkable for their size in diameter that was the case but a few years since. Exhibitors now more readily grasp the requirements of the present day taste. Blooms remarkable only for inches in diameter and poor colour in petal are not what are sought after. Such as these are the result of "taking" buds formed too early for the variety, and which are coarse and objectionable in every way.

Exhibitors quite inexperienced would do well during the coming season to select their blooms quite on a different basis. A bloom large in diameter if accompanied by other attributes, such as depth, evenness of contour, solidity of petal, brilliancy of colour, combined as this latter is with freshness, are all superior features; *then* size in diameter is an important item.

Varieties, too, that have reflexing florets of a semi-drooping character, with well filled centres, are the type of Japanese specimens to aim at. We do not wish to see through the florets on to the stands or vases when looking down upon an exhibit; we require greater density. Exhibitors of experience know quite well that blooms of the character I note always obtain more points in close competition than these of an opposite "build."

Many visitors to shows think the neatly staged Japanese blooms, or even the curled drooping forms; are all "dressed" by the aid of curling tongs or tweezers. Those of experience know quite to the contrary. A perfectly developed Japanese bloom does not require any manipulation of its florets, let alone "dressing," as is understood by the inexperienced.

In the case of incurved kinds I note in some districts there is too strong a tendency to favour large flat blooms if they have broad florets, in preference to those more globose. The true typical incurved bloom is likened to a globe, and as such should be borne in mind when staging. Cross-eyed flowers and others with reflexed florets, especially at the base, as is the case in many present-day varieties, should always be avoided. A medium-sized, perfectly formed bloom is always preferred to a large coarse example, for the reason that such a specimen lacks but one point—size—whereas the other contains only this one feature.

In Chrysanthemum culture, as in all matters appertaining to exhibits of horticulture, quality should rank foremost. I think even now there is a growing tendency amongst prominent exhibitors to staging blooms but partly opened, many, indeed, requiring quite a week to give them the necessary finish. In the Japanese section this is especially the case. At this stage I would point out to such an exhibitor what are the duties of a judge in such an instance. It is obviously the duty of these officials to take into consideration what is the state of the exhibits upon the day appointed. He has nothing to do with what they will be or in what condition such exhibits were. The appointed day is in his mind, or ought to be. If due weight were not given to an exhibitor who conforms to this rule, what

would be the encouragement to an exhibitor who "times" his blooms to a day?

This latter is not the least simple phase of Chrysanthemum culture for exhibition. Fully developed blooms will always add a point or two over those not so, presuming, of course, all other points are perfect.—E. MOLYNEUX.

(To be continued.)

### Cuttings.

Notwithstanding the knowledge of this plant now obtained by almost everyone who takes an interest in flowers, failures to root the cuttings are quite common. This, to our thinking, is due entirely to coddling. I have known gardeners who are not satisfied unless they are constantly sprinkling water on them, and are afraid to see the leaves flag in the least.

The newer varieties have especial care in this respect, and are consequently lost, the dealer being then abused for supplying bad cuttings. I think we might learn something from the dealers in rooting Chrysanthemums. For them it is an exception to lose a single cutting. Give them a tiny sprig of growth with one or more leaves, and in three weeks or so it is turned into a fresh-looking, growing plant. In their case there is no especial mixture of soil; the cuttings are simply dibbled thickly in shallow boxes filled with ordinary potting mould. They are thoroughly soaked, and the boxes put in any glass structure where frost is kept out. They do not receive daily sprinklings, but are allowed to droop their leaves, if we get sun, and are again watered when the earth requires it. In due time a gradual lifting of the leaves is noticed, and then neither sun nor air will cause them to droop again.

Instead of this we find sturdy little plants, with roots attached, and ready to pot singly into small pots. To those who grow the plants for sale propagating is a simple matter. But we find such artificial means employed in many places where Chrysanthemums are grown with care for show purposes that there is little wonder a bad start is made. In the first place, a closed box must be had, the top, of course, of glass. These are placed inside other glass structures. Then cocoa-fibre must be employed to plunge the pots, each one containing a cutting. Then the daily sprinkling, wiping moisture from the glass, and so on. In the end a goodly percentage are lost through damp, and those that do root are drawn up and weakly.

I would advise more rational methods with a hardy, easily grown subject. Treat Chrysanthemum cuttings as we manage *Calceolaria* cuttings, for instance; that is, dibble them in soil in an ordinary frame, where frost may be kept out; then failures would be very rare indeed.—H. S.

### "The Family of Composites."

This autumn session of the Birmingham Gardeners' Association began on the 5th inst., by the presidential address of Prof. Wm. Hillhouse, of the University, Birmingham. The subject of his dissertation was "A Few Botanical Members of the Family of Composites." Illustrations were afforded by the fine display of Dahlias and early flowering Chrysanthemums staged in the lecture room of the Athletic Institute. The professor dealt with the subject in his usual familiar and entertaining manner, abjuring as much as possible scientific terminology. Allusion was also made to the fact that out of the about eight hundred groups in the family of Composites, only about ten per cent. afford medicinal properties. The lecture was listened to with wrapt attention, followed by an interesting discussion, in which Messrs. W. Spinks, Walter Jones, R. C. Bick, W. Gardiner, and R. J. Hamill took part. There were two or three new members elected, including Mr. T. Humphreys, the new curator the Botanical Gardens, Edgbaston. In response to the offer of prizes for Dahlias and Chrysanthemums arranged for effect, there was a very good competition, and also non-competitive groups, the winners being respectively for Dahlias: Messrs. W. Mason and G. Stacey; for Chrysanthemums, Messrs. T. Sceany, J. Sceany, and W. Hiron. A first class certificate was awarded to Messrs. W. H. Simpson, nurserymen, Birmingham, for a fine assortment of Chrysanthemums; and certificates of merit to Mr. R. J. Hamill, manager of The Vineries, Acecks Green, for a fine collection of Cactus and pompon Dahlias.

CROSS-BREEDING: THE EARLIEST EXPERIMENT.—It is an interesting point that the first experiment in cross-breeding was performed upon the common Pink. This was just two centuries ago. Fairchild was the experimenter, and the result was a perfect success.

AN "ORCHID DAY."—Some of the followers of Mr. Chamberlain have suggested the formation of an "Orchid Day," on the lines of the "Primrose Day," in honour of the politician's favourite race of flowers. *Cypripedium*, *Odontoglossum*, or *Dendrobium* might be suggested, if the proposal becomes serious.

## NOTES

## NOTICES

**School Teachers and Horticulture.**

The Royal Horticultural Society has, in response to requests, decided to hold an examination exclusively for school teachers in cottage and allotment gardening. June is the month fixed for the examination.

**Course of Lectures on Advanced Botany.**

During the first term of the University of London Session (1903-4) a course of eight lectures on "The Relation of the Composition of the Plant to the Soil in which it Grows" will be given by A. D. Hall, M.A., Director of the Rothamstead Experimental Station, at the Chelsea Physic Garden. The lectures will be given on Tuesdays, at 3 p.m.

**Lecture on Chrysanthemums at Peckham Public Hall.**

A lecture on Chrysanthemums will be given by Mr. Edwin Molyneux, under the auspices of the Dulwich and North Peckham Chrysanthemum Societies, on Wednesday, October 21, 1903, the chair to be taken by Mr. C. H. Curtis, at 8 p.m. The annual exhibitions of above societies will be held as follows:—Dulwich: At the Baths, Goose Green, S.E., November 4 and 5. Peckham: At the Baths, Church Street, S.E., November 11 to 13.

**Croydon Gardeners.**

Mr. Joseph Cheal, of Crawley, at the latest meeting of the Croydon Gardeners' Society, lectured on his tour in the U.S.A. and Canada, illustrated with lantern views. Meritorious exhibits were contributed by the President, Mr. Frank Lloyd, Coombe House, whose head gardener, Mr. M. E. Mills, staged a collection of cut blooms of bush Chrysanthemums, Anemones, and the Magnolia grandiflora, and from Mr. J. R. Ball, head gardener to Mr. A. D. Klaber, Norhyrst, South Norwood, came cut blooms of Salvia "Red Dragon" and a seedling Helianthus. The next meeting will be on Tuesday week, when "A Year's Work in the Vinery" will be the subject from Mr. W. Taylor, Tewkesbury Lodge Gardens, Forest Hill, S.E.

**Uncut Corn at Hamilton, N.B.**

A correspondent writes:—"We have been getting our share of wet weather of late here. Monday, Tuesday, Wednesday, and Thursday of last week rained almost continuously. To-day (Saturday) is simply a treat. After 3deg or 4deg of frost last night the sun has come out in its most brilliant attire, which, I am afraid, presages a somewhat stiffer frost again to-night. Farming affairs are not specially comforting, especially where much of the crop is still ungathered. This is a late locality, and much of the Corn and Wheat remains on the fields—some uncut. Potatoes are showing marked symptoms of Phytophthora. Turnip and field Cabbages, though not so good as usual, are considered favourable."

**"The Orchid Hunt."**

As the old Gaiety Theatre crumbles and disappears beneath the ant-like persistence of the housebreakers, the new Gaiety just opposite has quickly grown up to the public view, and is outwardly a completed edifice. It will soon be opened, and in the story that forms the basis of the plot of "The Orchid Hunt," now being rehearsed as the first piece for the new theatre, an Orchid will lead to complications as varied, if not so serious, as those that followed the missing letter in "A Scrap of Paper." The opening act is laid in Kew Gardens, where a school for the study of the history and cultivation of Orchids is in session. The rivalry of two amateur cultivators of Orchids—a great English statesman and the French Minister for Foreign Affairs—leads to a wager as to which of them shall secure the most perfect specimen of a certain plant. Collectors are sent to Peru to search for something of great beauty, and fortune appears to favour England, until the wiles of a pretty French girl secure the prize. With this she lands at Nice, where the second Act takes place. In the end, however, a humble and amusing English gardener—to be impersonated by Mr. Edmund Payne—produces a still finer specimen that he has quietly grown at Kew!—"Daily Mail."

**The Potato Crop—and Manuring.**

We commend to the notice of all our readers, but particularly to those who are vegetable growers, the remarks conveyed on the Farm page in this week's issue.

**Retirement of Mr. J. McIndoe.**

It is announced that in consequence of the death of Sir Joseph Pease, Bart., and the sale of Hutton Hall estate, the well known head gardener is shortly retiring from active service there, where he has been for nearly thirty years.

**A Correction.**

In the paragraph on page 331, referring to the appointment of Mr. Robert Hay as head gardener at Hopetown House, a line was inadvertently transposed after the page had passed the editor's hands. The sentence beginning: "The head gardener having been," should have continued: "Laid aside for several months, it more and more fell to Mr. Hay," and so on, as the paragraph thereafter reads.

**The Journal's Rose Analysis.**

This important analysis of exhibition and garden Roses will be presented (unless anything very unforeseen should occur) in our issue of October 29, the last in the present month. It will thus be in good time, especially in this late season, for intending planters to make selections by its guidance. As there is usually a great demand for the Rose edition, it would be advisable on the part of readers to make sure of a copy by timely notification to their newsagent.

**The Horticultural Club.**

The usual monthly meetings of this Club at the Hotel Windsor were resumed on Tuesday, the 13th inst., after the customary vacation interval, and subsequently to the house dinner, under the genial presidency of Mr. Harry Veitch, a most interesting lecture was given by Mr. Charles E. Pearson, entitled, "Bird-Nesting in Russian Lapland." The lecture was illustrated by beautiful lantern slides, prepared from photographs. Of the lecture, we hope to report more fully in our next.

**Liverpool Horticultural Society.**

The above society is unable to secure St. George's Hall for their annual Chrysanthemum show, and have therefore decided to hold it in the Drill Hall of the 4th Liverpool Volunteer Artillery. The Drill Hall is situated opposite the Botanical Garden, in Botanic Road, and is a large and commodious building, in every way suitable for a floral display. It is also within easy distance from all the tram routes, and Edge Hill Station. Numerous entries are already registered, and there is every prospect of having a grand show of the Autumn Queen.—J. S.

**United Horticultural Benefit and Provident Society.**

The monthly committee meeting of this society was held at the Caledonian Hotel, Adelphi Terrace, on Monday evening last. Mr. Charles H. Curtis presided. Four new members were elected and one nominated. The death certificate of two deceased members (Mr. John King and Mr. J. M. Young) were produced, and cheques were granted to their nominees for the amount standing to their credit in the society's books, being £48 3s. 1d. and £17 9s. 4d. respectively. Seven members were reported on the sick fund. Members and friends requiring tickets for the annual dinner on the 27th inst., will please send to the secretary for them as early as possible. His address is 9, Martindale Road, Balham, S.W.

**A Japanese Nurseryman's Catalogue.**

On Monday last we received as quaint and beautiful a catalogue as ever we have seen. It came from Japan, from L. Boehmer and Co., 5 and 28, Bluff, Yokohama. The paper is of thick texture, and cream coloured. Each page has a coloured illustration, the subjects being Lilioms, species of Prunus, Viburnums, dwarfed trees, Japanese gardens, and scenes at Japanese flower shows with the dainty little ladies holding their long loose robes, and showing their tiny feet; views of Bamboo masses, Roses, Camellias, Wistarias, Irises, Magnolias, Chrysanthemums, and other lovely Oriental flowers. The text or reading matter (all in English) is run in and out amongst these pictorial illustrations, and the catalogue is more like a book on the flowers and trees of Japan, than what it merely aspires to. The lover of Japanese seedling and bulbous plants will certainly find this a very interesting publication.

# Chilworth Manor, Romsey, Hampshire.

Being the combination of a cyclist, camera-"fiend," and enthusiastic horticulturist, I was tempted by the recollection of some fine fruit exhibited at the Bath Show last August, and reproduced in the *Journal*, to pay a visit to Mr. Mitchell, gardener to J. E. A. Willis-Fleming, Esq., at Chilworth Manor, near Romsey.

Leaving Southampton some miles below, the road takes you by gradual ascents to the top of a ridge of hills, from which some magnificent views of the surrounding country may be obtained. Then on through large tracts of woody districts, interspersed with stretches of Heather in full bloom, and the large green fronds of the Bracken Fern shimmering in the wind, catching the rays of the sun, and looking like a sea of purple and green; while ever and anon a rabbit skips across the road right in front of the bicycle. Such was the seductive scene continually presented to me, until, after above seven miles riding, I arrived at the entrance to the Manor drive, with its curious thatched beehive lodges and well kept Laurel arch.

The Manor is a long rambling building (which is shortly to be pulled down and replaced by a more modern mansion), and stands surrounded by over 120 acres of park, lawn, and gardens. It is approached by a long drive, while on either side is the wild garden, with gigantic Firs and Cedars towering high overhead.

Skirting the side of the house is a large and well kept sloping lawn. At the base of this there is a broad gravel path, fashioned on the antique style, with large ornamental stands at intervals on either side, and at every 20yds there are a series of steps. At the bottom of these is an ornamental fountain, with golden carp swimming in and out among the Water Lilies; while further on one notes a series of rustic arches, covered with rambling and other Roses, completing a picture which is not met with every day.

From the lawn a splendid panorama is unfolded to the visitor. Some ten to fifteen miles of scenery is visible to the naked eye.

Leaving the house, we reach the kitchen garden by a series of rustic paths and arches. Here the same neatness and order is to be found, as in every part of the garden; while some of the vegetables are champions of their kind. Fruit, in the shape of Apples, Pears, Plums, and Currants, as elsewhere, are conspicuous by their scanty yielding. Turning to the right, we enter the Peach and Nectarine house; and by the aid of a friendly hand barrow I am enabled to reproduce a photograph of the Peach Dymond, as grown by Mr. Mitchell. As will be seen from the illustration (page 357), the trees are so pruned that the fruit has every chance to grow to the top, thus enabling them to catch the light which gives them their rich colour.

Passing through a turning in the garden, it is with feelings akin to awe that I enter the large vinery, and Mr.

Mitchell displays with just pride the magnificent specimens of his cultural skill. The hanging bunches are large, well shaped, and well coloured, some of the berries being as large as small Plums. The chief varieties are Muscat of Alexandria, Gros Maroc, and Madresfield Court. I essayed a photo of a bunch of Gros Maroc on the Vine, but owing to the light and the difficult position of it, the result was not good enough for reproduction. A large Peach tree, covered with luscious, well shaped, and coloured Sea Eagle fruits, much to my regret I was unable to photograph, owing to the position of the fruit.

The Fig tree walk, extending over 100yds, is worthy of mention; but the early frost played havoc with the fruit, so the crop is naturally small. The Begonia house, with Ferns and Palms, also reflects great credit upon the grower. In conversation I learnt that Mr. Mitchell has filled the position of head gardener for over twenty years, and during this period he has won numerous awards at the Crystal

Palace, Bath, and other places noted for large fruit shows. I understand that he is exhibiting shortly at several shows, and, without wishing to unduly alarm any of your readers, I warn them to beware, for the veteran fruit grower at Chilworth has something "up his sleeve" in the shape of Grapes, Nectarines, and Peaches [August].

A very pleasant afternoon finished, I quietly cycled back to Southampton, my enthusiasm being roused to a greater pitch by the all-round display of cultural skill it had been my good fortune to inspect.—E. E. R.

Front view of house and lawn.

HAMPSHIRE. — This southern county has a surface of 1,112,000 acres, considerably varied in character of surface, yet without high hills. The Isle of Wight is a detached portion, remarkable for its beauty and fertility; the Downs, a chalky range, were at one time quite bare of timber. The New Forest and Bere Forest occupy large tracts near Southampton; while on the borders of Dorsetshire there are large tracts of heath, and on the seashore extensive marshes.—(From "London.")

THE GREEN ROSE.—This Rose, with its curious blooms, was introduced as long ago as 1856 by Messrs. Guillot and Clement, of Lyons, France, under the name of *Rosa viridiflora*. It was also cultivated in England about the same time under the name of *Rose Bengale Vert*. It is still catalogued by Melbourne and English nurserymen under the name of *R. viridiflora*, and when grown on poor soils is a very interesting object.

PORTRAITS OF BOTANISTS.—Dr. Wittrock, of Stockholm (observes the "*Gardener's Chronicle*"), has prepared a catalogue of the extensive collection of portraits of botanists contained in the library of the Botanic Garden, Stockholm. Of many of them reproductions are given. Brief biographical details are also supplied, so that the publication is one of much interest to botanists. The text is in Swedish, but Latin summaries are added for the benefit of those not conversant with the Scandinavian tongue.

## Combination Bedding.

In the battle of the bedding, or, rather, those quiet conflicts 'twixt architect and gardener, in which the former has by classic design imposed the penalty of formal gardening and brought a biennial strain upon the latter in carrying all out "decently and in order," we have a contentious question it is not purposed to thrash out now. Sufficient to say that an expanding wave, and a potent one, too, has of late years swept over gardening England, and the old order of garish formality gives place to the new one of graceful freedom.

However, as many cannot shake themselves entirely free of the fetters of formality without some danger of running amuck amongst the classic outlines by which they may be environed, they would fain seek relief from the laborious luxuriance and ultra extravagance entailed by constant cropping with tender plants of delicate grace.

Never more than during the present season, perhaps, has the wisdom of employing plants better suited to our fickle climate been exemplified, and possibly, too, such seasons may breed thoughts in the minds of not a few that such of our stately homes as are planned on the noble Italian style are better adapted to the sunny south than to the cloudy skies of Old England. However that may be, it cannot but be admitted that the informal, many-gabled, picturesque mansion has not only a charm peculiarly its own, but readily lends itself to the new gospel—if it is new—of freedom and grace at the gardener's hands, besides providing sunny nooks and sheltered angles for such tender subjects as he may still have a lingering regard for.

Happy is the man so situated, and whose artistic soul breathes in the deep beauty of such scenes until his inspired hand grasps to the full its many opportunities. But it is for less fortunate brothers who have to wrestle with Nature on a wind-swept terrace plateau where Sir Architect has dumped down his massive Italian mansion, and carried far out, may be, into the grounds those severely geometrical lines to harmonise with it, which, of course, they do, and which perforce nothing else does, who is to be sympathised with. It is a bad job, some may say (some have said), but it cannot be altered. Yet, probably, the labour can be lessened, and the burden of

"that blessed bedding" be considerably lightened; and although easement cannot be made to go the whole way, it can be made to go considerably further than at first sight may appear to be either prudent or possible. We cannot altogether hope to have Mr. Robinson's ideals copied everywhere, literally, though that might save labour. But

in the first place, fortunately, well kept lawns, so inseparably interwoven with the characteristic of English gardening, and English climate, too, are not only prominently pleasing features, but sufficient in themselves to soften and tone down much that would otherwise be past redemption, so far as artistic gardening is concerned. By the way, how pre-eminently the passing season has suited the greensward! Too often this *pièce de résistance* suffered severely in the craze for cutting and carving out a multiplicity of beds, and it has been noticed that where, during the abatement of the bedding fever, half the beds have been turfed over, results have

been distinctly advantageous so far as appearance is concerned, not to mention the relief gained by a fifty per cent. reduction in the bedding stock. Not only on the grass, but where geometrical designs have been formed by Box-bordered beds on gravel nothing has suffered by turfing over a number of beds and leaving designs intact; in fact, in this particular case, a more pleasing effect is gained, as well as relief in two senses, by the interpolation of grassy greenery. On the score of economy, men who are at their wit's end to

make both ends meet might well consider the desirability at this timely season of calling the attention of the powers that be to this matter, and of pressing the point too.

In direct relation to our text is the bedding of the formal garden, well furnished beds being the desideratum, be they many or few, and any relaxation of the biennial strain imposed by spring and summer bedding without sacrificing effect would be welcomed for the more economical considerations are felt the less desire there is to show them. Tangly growths and many mixtures are out of place in the formal garden. Pruness and trimness,

however much they may be abominated by the disciples of natural freedom, must more or less prevail, but there is no reason why the slavish devices of carpet bedders should be adhered to. At the season, now at hand, for planting the spring display, much can be done to lighten the labour of

Entrance to the drive.

View looking from the lawn.

next summer's bedding by the free use of low growing, hardy plants to eventually hold a practically permanent position. In saying that some of these favoured by personal experience are but of the common order of their kind, it is anticipated that the greater spirit of toleration now in evidence will admit them to the list, instead of blackballing them out of it. Some of the finest effects in spring gardening are to be gained by their use.

The first consideration may be given to long borders, which often bound the formal garden and bear the odium of "swallowing up a lot of stuff." These being of varying length and width, no rigid lines for filling them can be laid down here. In planting now, the future must be kept well in view: edging or divisional lines or bands of the perennial plants employed, being considered as permanent future difficulties, will be avoided. Obviously suggestions only can be given, for the subject is very elastic. As an example of what may be done with a long border, now cleared of its summer occupants and prepared to receive the spring bedders, this may be crossed diagonally with lines of London Pride and re-crossed in the opposing direction, thus forming square or diamond shaped panels, according to the angle at which the lines are drawn. This pattern, again, can be formed inside an edging of the same plant, and formed, if desired, to leave small triangular marginal spaces for, say, *Violas* now and *Lobelia* next season. We thus have a number of central panels admirably adapted for filling in with Forget-me-not, Wallflowers, or other spring bloomers. London Pride and blue Forget-me-not form, when in flower, a charming combination of colour, coming as a revelation to those who have not hitherto seen it.

The same combination can be carried out in oval, square, or circular patterns, all of which form panels eminently suited for filling in now, and with summer bedders in their turn. Where bedding is done on an extensive scale bright-coloured, hardy, foliaged shrubs, such as the gold and silver leaved *Euonymus*, which can be kept low by pegging down, are valuable for making some of the panels permanent: one plant which commends itself in particular for this purpose is *Veronica cupressoides*, quite a gem in its way. London Pride, amongst the lowly, only has been mentioned, but other *Saxifragas*, including *S. Wallacei*, are good for the purposes, as are *Campanula pumila* in its blue and white varieties; red and white *Armeria* (Sea Pinks, or Thrift); *Alyssum saxatile*; the *Cerastiums*, where they stand the winter well; *Veronica incana*, and some of the *Sedums*. The latter, however, are not so amenable to control, and too dwarf to give the bold framework generally required to set off the legitimate croppers, yet may well find a place in filling some of the front panels.

Bold edgings to large beds of plain design, round, oval, or square, can be readily found in the list mentioned, and with plenty of space and a little ingenuity crude outlines can be broken up by chain, half circle, or other patterns, as taste may dictate or material provide for. For our largest round beds *Alyssum saxatile* is much esteemed as an edging, and the filling in with Ruby Gem Wallflower, which will shortly take place, is remarkably effective in spring, when both are in bloom. Year-old seedling plants of this *Alyssum* are best for the purpose, as the plant is a bad lifter, but when once established a massive permanent edging results, which will hold its own for years, the silvery-grey compact foliage during summer forming a pleasing foil to the glare of scarlet *Geraniums* or tuberous *Begonias*.

Much more might indeed be said of the many ways in which these useful hardy plants can be employed as permanent bedders, but, probably, sufficient has been shown of the all round benefits to be derived from combination bedding. Such things as advocated when once planted grow apace, and ample stock is always to hand for replanting, although they are quite amenable to keeping within bounds by annual trimming. Summer, of course, finds them flowerless, yet there is a quiet beauty in the various greens and soft greys which rather adds to than detracts from the short-lived brilliance of the tender things.

Such doctrine, undoubtedly, is rank heresy to the orthodox bedder, but there are not wanting signs of the times to show that the orthodox bedder is likely, sooner or later, to become as extinct as the Dodo, and all that is advanced here is a compromise between his faith and that free thought which would relegate the scarlet *Geranium*, tuberous *Begonia*, and all the tender tribe to oblivion, leaving an opening in the formal garden for an incongruous mixture of rampant perennials to clash with classic outlines.—QUIZ.

## The Modest Violas.

When recently at Edinburgh I made a journey to Pilrig to see the veteran James Grieve, the originator of the race of bedding *Violas* grown in the present day. Here, in the occupation of some ten acres of the old Pilrig nurseries of Messrs. Dicksons & Co., Mr. James Grieve and two of his sons have a nursery where many things are grown for sale, but in which the *Violas* and the *Pansies* play a very important part, and where large quantities of both are grown.

### VIOLA HYBRIDISATION.

It was in 1862 that James Grieve, then with Messrs. Dicksons and Co., commenced the cross fertilisation of such species of *Violas* as *lutea*, *stricta*, *stricta alba*, *cornuta* and others, and commenced the group of small-flowered, free-blooming varieties which have become so useful in gardens, for it is as a garden plant that the *Viola* has its widest scope of usefulness. One aspect of *Viola* culture at this nursery which had great interest for me as an old raiser was the large proportion of old standard varieties being grown for bedding purposes, and this not from any lack of novelties, but because so many of the new varieties which have been sent out in recent years were put forward as exhibition flowers, with the unfortunate result that much rubbish, from the flower garden point of view, has been put upon the market, and some of the new Midland varieties in particular came in for condemnation by Mr. Grieve, jun. The exhibition of *Violas* is carried on only in a very restricted degree, while huge quantities are employed for garden decoration.

I was at Redbraes early in May, and the most precocious flowering *Violas* were Redbraes Yellow, a very dwarf, compact growing, rayless variety, excellent in colour, and remarkably free; White Perfection, an old variety, with long footstalks to the blooms, which makes it extremely useful for cutting purposes; William Niel, the best of its peculiar shade of rose colour here; Walter Welsh, a fine yellow, with rather dark rays, good grower, a little tall in growth, makes a good back row to a ribbon border of *Violas*; Lark, creamy white, edged with heliotrope; Lizzie Paul, a good bright yellow, very like Bullion; Mrs. Charles Douglas, a somewhat large but useful yellow self; Pembroke, a soft yellow of good habit; Primrose Dame, in the same way, but of a rather paler shade; Sunset, a pretty *Viola*, top petals rosy lilac, lower primrose yellow; William Haig, which is regarded as a slight improvement upon Archie Grant; Canary, pale yellow flowers of good quality, but a strong grower, has a Picotee edge of white in summer; and Marchioness, which is considered by Mr. Grieve as the best white *Viola*. The foregoing represented the earliest to bloom in the collection, and that in a somewhat cold district, and they may be accepted as being valuable for spring bedding.

### THE NEWER VIOLAS.

Among the newer *Violas* was Royal Scot; this is a seedling of Mr. Grieve's, and it is an improvement upon True Blue, and the latter, though raised many years ago, is still one of the best blue bedding *Violas* in cultivation. The flowers are rather larger than those of True Blue, of a clear colour, with a white and yellow eye. Grievei Improved is, as its name implies, an improvement upon Grievei, raised some forty years ago, the old form still a most useful bedder. Sulphurea makes a good bedder, being dwarf and very free of bloom, it is thin in substance, and suffers in wet weather. Pilrig Park, white, has a fine constitution, though it is quite thirty years old; Pencaitland is also an excellent bedding white, very free, and pleasantly sweet scented; Mrs. J. B. Stewart is a light variety edged with blue; Councillor Watters is a deep blue purple with a flush of crimson, good shape and stiff flower stems; J. B. Riding still stands somewhat alone for its peculiar shade of colour; King of Crimsons is in the same way. The old Lilacina is an old variety with some individuality of character, and makes an excellent bedder. Duchess of Sutherland is of a very pleasing pale lilac tint, and is found very useful for bouquet work; Blue Gown is acceptable in colour, but its constitution being feeble it cannot be depended upon as a bedder; Blue Duchess, pale blue, is thought to be a sport from White Duchess, which it greatly resembles in habit; Acushla is distinct in character, and desirable as a bedder; Countess of Kintore is still one of the best of the blotched varieties, but in this moist part of the country stands badly during summer.

Ariel, delicate mauve, is very pleasing, and it makes a delightful bedder; Tom Wilson is a deep coloured William Niel; Sir John is a rather large lilac-tinted variety. The old Blue Bell is also grown in quantity and much appreciated; and Mrs. C. Turner, of many years' standing, one of the best clarets.

At the Redbraes Nursery the Viola plants are put out in cold frames in autumn, but there is no glass covering to them; all the protection they receive is a few faggots placed over the frames in stormy weather. Grown under such conditions the plants are of the hardiest character, and are moved from the frames with good balls of roots.

Pansies, both Show and Fancy, are largely grown; so are Phloxes and Pentstemons, and many other subjects in which the Scotch florists take delight. A large quantity of a scarlet Dianthus belonging to the Mule type is to be seen which makes an excellent summer bedding plant. Soft-wooded florists' flowers and bedding stuff in enormous quantities are grown. A visit in July and August to the Redbraes Nursery should be one of an interesting and instructive character.—R. DEAN.

## Fuels for the Garden.

The following are the conclusions given at the end of a long paper read recently before the American Florists' Convention at Milwaukee:

That coal is the cheapest and best fuel that the market affords, 11b under ordinary conditions evaporating about 7½lb of water at 212deg F. That the provision for a liberal reserve supply of coal is, under most circumstances, the safest method of providing for an emergency. This supply need not be stored near the boilers, and should only be used when coal cannot be secured from the regular sources. The interest on the money invested in such reserve supply of coal will be wisely expended. That 11b of dry wood will evaporate about 4lbs to 7lbs of water at 212deg F. That wood is in many cases the most efficient substitute for coal during a short period. That where crude oil can be secured at a reasonable price it is the best and most reliable substitute for coal, and where it can be purchased as low as 4s. 2d. per barrel it is preferable to coal at 3.50dol\* and upward per ton. That 11b of crude oil will evaporate 13.3lb of water at 212deg F., and that 11b of oil has a heating efficiency equal to that of about 1.6lb of coal. Also that the use of oil is clean and economical so far as the fire-room work is concerned, and if properly burned no smoke is produced.

That the mechanical part of oil burning has passed the first experimental stage and has proved successful. That there are a number of good burners upon the market, especially of the sprayer class, using compressed air or steam for volatilising the oil. That a cheap and efficient burner can be made from comparatively inexpensive materials. That oil can be burned in an even and effective manner, especially under steam boilers of the water-tube class. That petroleum will probably never replace coal for general use. In the discussion, it was stated that garbage was being used by some cities as fuel. The efficiency and adaptability of natural gas as a fuel for green-houses was emphasised by various speakers.

**RASPBERRIES AT BLAIRGOWRIE.**—Raspberry growers near Blairgowrie, N.B., have sent away 1,400 tons of fruit this year, realising, according to the "Sun," £50,000.

## Bath Botanic Garden.

The Bath Botanic Garden is situated within the public park—the Victoria Public Gardens. It is purely an open-air garden, for the culture of the lesser-known hardy shrubs and plants; and is superintended by Mr. Milburn, who, indeed, made the place. His first work there was enough to test the courage of any gardener, much less a recruit fresh from Royal Kew, for the ground had been the town toom, and all sorts of foreign material, quite impossible to use for good gardening, was found. But the garden is now grown up, and orderly. The late Mr. D. T. Fish, on his first visit to Victoria Park, was very greatly charmed with its beautiful aspects, and did not stint his pen of praise when he came to write its description for his paper.

At the north side of the Botanic Garden there is a small bog area. Here are such handsome plants as the purple variety of New Zealand Flax, also *Cytisus purpureus* or purple Broom. *Rodgersia podophylla* is always noble by the side of water, just as the Gunneras are; and the Spiral Rush (*Juncus effusus spiralis*) is quaint, and helps the general effect. Amongst dwarfier plants one cannot omit the double flowering *Cardamine pratensis*, which equals the double white Arabis. The Wood Lilies or Trilliums come under this head, and the Tiarella furnishes showy masses of its spiky flowers. Behind this place of bog plants the curator has planted a fringe of the hardier Bamboos, including the bold-leaved *Bambusa palmata*, the graceful, black-stemmed *Phyllostachys nigra*, the moderately dwarf growing *P. Fortunei variegata*, and *P. violascens*. Others are there, of course, but these were specially noted, as also the Arundos and the graceful Reeds.

Here and there one could see the plump, fat growths of the King of Lilies, *Lilium giganteum*, which gives such a gardenesque touch to any plantation of shrubs and flowers. Eremuri, with their rigid, stately spikes, severe, dignified, imposing; they, too, were here; and then we wander to the rock garden, where that gem of tiny foliage plants shows its chocolate-toned, burnished leaves—the *Shortia galacifolia*. It grows high up amidst Alpine snows, yet it also thrives in the placid air of beautiful Bath.

But ere we pass to the alpine collection a notice board catches the eye, and here we see a list of the rarer or most interesting plants that at the moment are to be found in flower; and we learn that this list is supplied constantly for the subscribers' benefit, by the curator. It is useful, and might be followed

Peaches as grown at Chilworth Manor.

with advantage elsewhere.

In the rockery itself, the bold spreading masses of Phlox subulata recall their charms even now, and I am writing six months after my visit to Bath. That is the way to grow the alpine Phloxes, whose spreading growths are healthiest when they are free to wander. And observe at the distant effect, as well as the charm at closeness; and as with Phloxes, so with a hundred other things that are the delight of flower lovers in every land.

The sweetly odorous *Daphne Cneorum*, not always successfully cultivated, however, was flourishing here in rude luxuriance, and made a feast of pale pink beauty. Given a few special needs, this lowly, beautiful plant well repays its owner, and it is the gardener's part to master his craft; to be able to nurse, doctor, and understand his patients; yet many act as though the objects under their care could metamorphose themselves into other and totally different characters, adapting their constitutions to conditions wholly antagonistic to those that Nature endows them with; yet all this for want of a little thought and study on the gardener's part.

As in all good rock gardens (and the Bath Botanic Garden, in this respect, is a fine model, as is Kew, and Birmingham, but not Edinburgh), there is a fairly liberal furnishing of suitable dwarf shrubs, like the mountain Picea, the nanus Birch, *Olearia Gumniana*, *Cistus ladaniferus*, *Fabiana imbricata*, *Cotoneaster horizontalis*, *Cytisus albus*, and many more. These break up the evenness, if that, unfortunately, through bad construction, exists; and in any case they give height and breadth, act as foils and a

background, and give a certain amount of shelter against cutting and killing ground airs.

The alpine collection has a goodly selection of the true Geraniums or Cranesbills, which are handsome and showy plants for the midsummer display. *G. sylvestris* and *G. sanguineum*, *Endressi*, and *ibericum* are particularly bright, robust and free. Then, for the opener spaces that exist here and there at the base of the rockery there was a little known, though extremely neat and pretty *Calceolaria*, that sows itself annually, and is named *C. mexicana*. It is a wonder our park superintendents, who have much bedding to do, do not find a use for it. *Saxifraga granulata* fl. pl., though so common, is a very handsome and useful plant, and grand for odd chinks wherein it catches root and thrives.

Part of the Bath Botanic Garden rockery had but recently been renewed, and was planted with *Opuntias* and *Saxifragas*. These highly interesting, if grotesque, Cactaceous plants are tried by fits and starts. Keen, hardy plant gardeners, and curators of botanic gardens ever and again made collections, but in ordinary private gardens they do not "catch on" as subjects for the ornamental planter. Truth to tell, they are "miffy," and require this, that, and the other care until they get a hold, and even then they are always going off. Probably the finest outdoor collection of *Opuntias* and *Mammillarias* in this country is that to be seen on the west side of the Palm House at Royal Kew; there they are doing well. The Earl of Ilchester, at Holland House, has an assortment of kinds which he partly shelters by means of urn-like or semi-cavernous constructions made of boulders and flat stones.

To do the rock garden justice at Bath (or anywhere else), one must see it at its best in summer; but this western city (famous for its hot springs and the Roman remains of sumptuous baths and aquariums) is to-day rich in exotic shrubs of ornamental merit, and comprise the list I give herewith. *Solanum crispum* is one, and a handsome fellow too, though seen only once in a hundred gardens. The reason is undoubtedly its tenderness; but the pretty pale lavender clusters are really fine. The Bath specimen is the only one I know of growing as a bush in the open, and has made 8ft in height and as much in breadth. *Cæsalpina japonica* had suffered from the late frosts we had in the spring, but the fact of its having grown to a bush in the open spoke eloquently of the mildness of the Bath climate. When it flowers it is a gorgeous subject, the racemes being intense rich yellow. Its floraison, however, has to be patiently waited for in most cases, unless, perhaps, southwards. The *Aralia* (or *Fatsia*) *japonica* had evidently stood out for a number of winters, but this subject can even become accustomed to the "bitin' cauld" of Scottish winters and springs, so that it ought to exist in these gardens of the Queen of the West.

*Raphiolepis ovata* or Indian Hawthorn, has leathery, ovate, shining dark green leaves, is of shrubby, close habit, and bears sweetly scented white panicles of blossom. It is too seldom seen. Then there are the various fine Japanese Quinces, the *Cydonias*, now all put under the genus *Pyrus*, of which *P. Maulei* and *P. Cydonia*, and *P. Schiedeckeri* are three of the gems. And what ails one at *P. japonica*?—plant of many graces, and so useful. In *Griselinia lucida macrophylla* we find a good foliage shrub, in this respect resembling a hardy *Rhododendron*, but without the wealth of floral yield given by these unequalled subjects. The seashore *Griselinia*, to wit, *G. littoralis*, seems as hardy as most needs require, seeing that robust plants can be viewed in the Duthie Park at Aberdeen—a bleak city, swept by violent nor'-easters.

The Common or Hardy Orange—*Citrus aurantium*, otherwise *Egle sepiaria*, might be chosen by planters were it known to exist here, and, more than that, to sustain its life and limbs alway. No one would plant it for its ornamental properties; at least, I hardly think so, since its dark green trifoliate leaves on tortuous, prickly, slender stems, are all it affords for beauty's eye. But then a hardy Orange: there's history and romance in the name!

But a really beautiful shrub is *Azara microphylla*, possessing, first, vigour; second, grace of growth; third, an evergreen character; and with these its neat oval leaves, about the size of one's finger-nails, that shine like a newly-polished mirror. It usually attains six to eight feet, or more, given time and a proper place. Nor are the Palms wanting. The *Trachycarpus* (*Chamærops*) *excelsus* is doing well along with a choice of Maples (*Acers*) in a sheltered corner, and really this pretty Fan-Palm is very hardy. *Photinia serrulata*, the Chinese Hawthorn, whose showy red leaves give such a marked effect in the fore-front of a shrubbery, when they are young, is another plant of note at Bath. It is fifteen feet high; think of that!

In conclusion, one cannot, or would not, like to omit *Collutea cruenta*, *Olearia macrodonta*, *Lonicera Barleari* (seldom seen), *Sheppardia argentea*, *Hippophaë salicifolia*, *Pyrus salicifolia*, and the Judas Tree (*Cercis siliquastrum*).

The inscription on a quaint and pretty cross-piece dial here is:

The hours are round this cross; and while 'tis fine  
The time is measured by a line.  
But if the sky be clouded, mark, alas!  
The hours not ruled by shadows from the cross.

—WANDERING WILLIE.

### *Tropæolum pentaphyllum*—What Treatment?

Can any reader suggest a plan to ensure the breaking into growth of *Tropæolum pentaphyllum* early, for summer blossoming? I have grown it—a very favourite flower—for some years, and find it is more likely than not that tubers planted in March will not appear and grow off, till October. Messrs. Sutton and Sons, from whom I had my tubers, recommend taking up and keeping in dry sand for the winter. I have a specimen in bloom now, left in the ground all the winter, which broke into growth early; but of half a dozen fine tubers planted in March, several have now (about October 1) started, and are growing vigorously, too late to bloom before the frosts nip them. One winter I managed with mats, to protect sufficiently two specimens which bloomed magnificently the next summer. I have wondered if the reason of its behaviour in this manner is that in its natural habitat this is its season for growth?—J. TURNER, Kent.

### Planting Season—The Falsity of Cheapness.

The seasonable article by "H. D." under this heading in last week's issue of the Journal (page 323) contains much of interest to intending planters. The remarks on cheap trees and cheap and unreliable labour should come home with some force to many people, and are well worth bearing in mind by all. Really good and properly prepared young trees are now produced at such a low rate by our leading firms that there is no excuse for anyone who chooses to pick up at a paltry figure the indifferent material too frequently met with in auction rooms. With all the information now available as to the merits and defects of varieties it is quite time that an end was made of planting inferior sorts.

To a certain extent I am also in accord with the writer's remarks as to planting in exposed positions, though these have their bad seasons as well as those occupying a lower level. One of the most successful fruit farms with which I am acquainted is situated in a hilly district of Surrey. Here, vale and hillside are fairly evenly balanced in proportions, and it frequently happens that though there may be a dearth in one portion, a heavy crop may be gathered from the differently exposed trees. One season it may be the low-lying land that fails, the next the high, but seldom is it that a general failure prevails.—PROVINCIAL.

### Flavour in Fruits—A Quandary.

As a close reader of the dear old Journal, I sometimes observe anomalies, and the following excerpts from the issues of last week and the week previous, require explanation from the powers that be. The question comes home with increased interest at this moment, for I have been nursing hopes of trying the pot-culture of Apple trees. But I want to know that not only are "the Gascoigne's samples comforting to look at," I also want *flavour*. The quotations are these:

"The orchard house culture of Apples on a large scale is expensive, and though the size, colour, and beautiful appearance of the fruits are very comforting, the flavour is not quite equal to that of a cracked old Cox's from a scraggy orchard tree. This would seem to put a premium on 'scraggy orchard trees'; but when a man handles and eats a magnificent Peasgood's or Gascoigne's sample, he hesitates to complain if the flavour falls short of his expectations, as judged from the outside."—J. H. D., page 306, October 1.

"The orchard house fruit (at Chiswick) made up for any deficiencies in the outdoor section, and was superb. It mostly came from Messrs. Bunyard and Co., Maidstone, but it had a lesson to teach to wealthy garden owners, namely, that if they would have fine fruit irrespective of season, the line is to erect orchard houses and adopt this style of culture. It has been proved without doubt that the finest Apples and Pears can be grown in pots under glass, and in these days of great wealth it is the finest and the best that are needed for the tables of the affluent. Considering these facts, and also the uncertainty of the British climate, as experienced this year, it will not be surprising if there is a great extension of orchard house fruit culture in the future, and such displays as that recently seen at Chiswick can hardly fail to give impetus to the movement."—G. H. H., page 337, October 8.

Is flavour sacrificed for appearance, or not?—D. O. E.

### Autumn Decorations.

At this season a wealth of artistic material lies to the hand of the decorator. Nature is in her most harmonious mood in the studies she gives in browns, and russet, and dull reds, mingled with the intense crimson of many berries. The multi-coloured tints in the fronds of the Braeken are simply enchanting, and the Traveller's Joy flings its long trails in a cloud of easy gracefulness. In hedgerow and woodland the artist may find much that is both useful and beautiful for room and table decoration. Let him leave the hothouse beauties and use these rustic wares while he may, for soon blustering gales will sweep away much of this dainty shading and toning. I wonder how many people have noticed the lovely hues taken on by the foliage of *Rosa rugosa* before falling? They are at times most delicate.—DECORATOR.

### Potatoes: Northern Star, Evergood, and King Edward VII.

In reply to your correspondent, Mr. Yates (page 337), who inquires as to the merits of Northern Star Potato, I shall be glad to give my experience of it. In this particularly wet and sunless season it has yielded with me at the rate of 14 tons per acre. The sets were planted 3ft apart each way on April 24, on rather heavy land, not by any means ideal soil for Potatoes. The land had been previously well dressed with farmyard manure, about 20 tons per acre. [See Farm page this week.—Ed.] At the time of planting it received a mixture of bones, muriate of potash, and sulphate of ammonia at the rate, respectively, of 6cwt, 1cwt, and 1cwt per acre. When the Potatoes were hilled they had a top-dressing of the same quantity of muriate of potash and sulphate of ammonia. When I tell you our rainfall here for August and September amounted to 8.37in, and that the number of bad or doubtful Potatoes amounted to four tubers to the ten, I think Northern Star's disease-resisting capability speaks for itself.

"Evergood" was raised also by Mr. Findlay, but previous to Northern Star. It is a first-rate main crop, and seems to improve year by year, but it does not yield like its younger competitor. [According to the Spalding test, "Evergood" was the best cropper. See page 351.—Ed.] As to "Edward VII.," a very large grower of it has lately offered to exchange 10 tons Edward VII. for 1 ton Northern Star. Comment is needless.—ALEX. M. WILSON, Bulb Grower, East Keal, Spilsby.

Last season I purchased 1lb of Northern Star from Alex. Dickson and Sons, Ltd., Belfast, for 10s. I had nine small sets which were divided and planted in the usual way, and left to grow as they might. I must confess to doubting that they would produce much, especially as they received a check, the tops being blackened by frost when about 6in above ground. A surprise awaited me when they were lifted, the yield being 77lb, which, I think, one may conclude is a splendid return. At present they are being offered from 3s. 6d. per lb and upwards, and I advise everyone desiring good value for their money to invest in the "Northern Star." From what I have seen of "Evergood" I conclude it is an equally good variety, and I shall plant a good quantity of these next season.—J. W. JONES, Knockin, Oswestry.

Results so far go to prove that the Northern Star is upholding its reputation, which was at first thought to be artificial and only so much boasting to keep up its price. My own experience goes to prove that it is a most prodigious cropper, also a disease resister, for whereas several other varieties were blackened upwards of a month ago, the "Northern Star" remained green until they died off naturally. Last spring I purchased 2lbs of "Northern Star" and received six Potatoes. These were placed in a greenhouse, and when all the eyes had commenced to grow the Potatoes were cut up, each slice having a growth attached, and potted into 3in pots, the number of growths being 55. When they had become established, the greater portion of them threw up other shoots, which I took off and inserted as cuttings, and when planting time came I had 90 plants.

They were planted out during the last week in May, at a distance of 30in from row to row and 18in in the row (which looked far too much space at the time, but which proved far too little). Subsequent treatment lay in earthing up, each one being done individually, by bending down the growths and filling up the middle with fresh soil until they were growing in mounds a foot high, and which caused them to send out innumerable roots from the stems.

By the middle of July they had covered all the space, and you could not see between the rows; and at the end of August some of the growths held upright measured 6ft. They were taken up on Saturday last, October 10, and weighed, there being 303lbs of tubers. The largest root turned the scale at 7lbs, and several roots had 40 to 50 tubers attached. The cuttings produced as heavy a weight as the sets, but not so

many tubers at a root, they not having "run" to the same extent as the original sets. When this variety becomes cheap enough to plant whole sets in the ordinary way the crops produced will be enormous.

Some "Evergoods" that were tried in the same way as the "Northern Star" only averaged 4lbs to each root, grew only 18in high, and never looked happy all the summer under such treatment, although it was similar to that described.—F. K. D., Cheshire.

### The Colouring of Apples.

May I ask a few questions? What are the conditions that favour the colouring of fruits, but more particularly Apples? I had, from experience, concluded that sunshine was the greatest factor, especially where the trees are mulched or otherwise fed, and thus have an abundant supply of nutritive material. Sunshine has not the same effect on fruits where the soil is poor, and no feeding is supplied.

Then, again, one has noted the quick changes to a ruddy tone caused by sharp, cold nights, and certainly cold is recognised as one factor that causes the colour-changes, by cultivators in general. But, lastly, What amount of effect has wind and rain? Are their influences (in the case of pot trees at all events) greater than either sun or sharp nights? I ask because lately I was informed by a firm of fruit growers that "they would rather be without the sun than the wind and rain, for the colouring of fruit." Can Mr. Willis bring science to bear on the question? Can "H. D.," or George Abbey, or "W. S.," or any of your many readers, give me (and others) the benefit of their opinions? The matter is one of much interest.—"LAMASOOL."

### Hardy Fuchsias.

Referring to your paragraph on page 305, I think that amongst cultivators of hardy Fuchsias there seems to be no general agreement which is the true Riccartoni variety. I have known as many as four names given to the one variety, viz.: globosa, Riccartoni, tomentosa and sanguinea. Mr. Nicholson, I note, says F. Riccartoni is a seedling from F. macrostemma globosa, which is quite sufficient to account for these two names being given to the one plant. Personally, I do not think sanguinea or tomentosa in any way applicable to the variety, and am inclined to think globosa is the correct name. Whether or not I am wrong I cannot say, but I should like someone to give information on the point.

Nowhere have I seen these hardy Fuchsias (globosa especially) luxuriating so much as in Norfolk. Around Cromer, close to the sea, they succeed splendidly. In Lord Battersea's garden at Overstrand, within a stone's throw from the sea, plants 8ft high, and double that width, are to be seen. In a small churchyard close by, too, they are growing and flowering amazingly every year. Of course the hardier and sturdier the plants are grown the better they pass through a severe winter. Much rank manure cannot be good for that purpose, although freedom of growth is necessary to give a profusion of blossom which these hardy varieties are characteristic of.—E. M.

### A Hint for Mutual Improvement Societies.

You will see from the leaflet I send that at least one society goes the proper way to business, and besides preparing one to receive a lecture, by giving the briefly outlined frame of the subject, it greatly assists one afterwards in remembering the aspects of the discourse. The Ipswich Gardeners' Society will be favoured by a lecture from Mr. A. Martinelli on the 15th inst., and the following synopsis has been sent out, and is what I think ought to be made a general rule. It is done in a few cases, but not often enough.—Lantern lecture on the 'Evolution of a Flower.' Synopsis:

- I.—Earth's basis a crystalline rock; absence of organic remains. First trace of vegetation. Primary types of land plants.—Lichens; Fungi. "Liverwort"—its fructification, stomata and viviparous buds. Seale and true Mosses.
- II.—OLD RED SANDSTONE. Ferns and Conifers. Silver Tree.
- III.—CARBONIFEROUS. Coal-forming plants; Lepidodendron, Sigillaria, Calamites, &c.
- IV.—OOLITE, roe stone of Dorset. Cycads; Conifers and Ferns. Fossil forest of Cycads.
- V.—TERTIARY, vegetation tropical. Tree Palms; Custard-apple, Cinnamon; Wellingtonia, &c.
- VI.—RECENT VEGETATION. Equiseta; parts of a flower; pollen, its form; sculpture and germination. Bloom of Meadow Grass. Inflorescence of Yew. Cuckoo-pint. Venus' Fly-trap. Water Crowfoot. Lesser Celandine. Formation of petals. Evolution of carpels and their retrogression to leaves.—F.

## Societies.

### Royal Horticultural, Drill Hall, October 13th.

A most varied exhibition was brought together on Tuesday last, there being Chrysanthemums, Dahlias, Michaelmas Daisies, Pelargoniums, foliage plants, Orchids, Begonias, and fruit in liberal array. Sixty-four new Fellows were elected. A paper on Raspberry and Strawberry culture by Mr. Hudson, was, owing to the illness of the latter, read by M. Alf. H. Pearson. Only four awards were made in all.

#### Orchid Committee.

Present: Harry J. Veitch, Esq. (in the chair); with Messrs. James O'Brien, de B. Crawshay, Walter Cobb, H. M. Pollett, H. Ballantine, Jeremiah Colman, F. Wellesley, Jas. Douglas, N. A. Bilney, G. F. Moore, A. A. McBean, F. W. Ashton, E. Hill, M. Gleeson, W. H. White, W. Boxall, W. H. Young, H. A. Tracy, J. Wilson-Potter, and H. Little.

Orchids filled one side of the hall. Messrs. J. Veitch and Sons, Ltd., had a brilliant display of hybrid Cattleyas, most of them bearing two, three, four, and five flowers. Amongst the best were *Laelio-Cattleyas* x *Nysa*, *L.-C.* x *Wellsiana*, *L.-C.* x *Aphrodite*, *L.-C.* x *Antimachus carnea*, *Cattleya Mantini*, *C.* x *Mrs. J. W. Whitley*, *C.* x *Enid*, and *C. Wendlandiana* together with a fine batch of *C. labiata* (Silver Flora Medal). H. T. Pitt, Esq. (grower, Mr. F. W. Thurgood), Stamford Hill, N., had *Cattleya aurea*, *C.* x *Mrs. J. W. Whitley*, *C.* x *Mrs. Pitt* (a sweet and beautiful flower), *Odontoglossum grande*, *O. crispum*, *Dendrobium Victoria Regina*, and other subjects. (Silver Flora Medal.)

Messrs. Hugh Low and Co., from Bush Hill Park, Enfield, sent well-flowered plants of *O. grande*, *C. Mrs. Pitt*, *C. Gaskelliana alba*, *Dendrobium formosum giganteum*, *Tricopilia nobilis*, *C. Mantini nobilior*, and *Lycaste Skinneri alba*. (Silver Banksian Medal.)

A cultural commendation was awarded to the Right Hon. Lord Rothschild (gardener, Mr. E. Hill), Tring Park, Herts., for *Laelio-Cattleya Nysa superba*. It bore eleven fine flowers on four leads.

#### Fruit and Vegetable Committee.

Present: Geo. Bunyard, Esq. (in the chair); with Messrs. Jos. Cheal, Henry Esling, W. Bates, S. Mortimer, Alex. Dean, Ed. Beekitt, Horace J. Wright, J. Jaques, G. Reynolds, C. G. A.

Nix, F. Q. Lane, J. Willard, G. Norman, Geo. Wythes, A. H. Pearson, Owen Thomas, Geo. H. Maycock.

Fruiting Apple trees were shown in pots from Wm. Paul and Son, of Waltham Cross. The trees were exemplary models, well furnished with stout young wood, and carrying numbers of fruits. The varieties were Cellini Pippin, Gascoigne's Scarlet Seedling, Blenheim Orange, Allington Pippin, Peasgood's Nonesuch, Lane's Prince Albert, Bismarck, Cox's Pomona, Royal Jubilee, and Emperor Alexander. (Silver-gilt Knightian Medal.)

Lady Tate (gardener, Mr. Wm. Howe), Park Hill, Streatham, made a really fine display of Grapes, fourteen blacks and thirteen whites. The Alicantes were large, well finished, and good; and the Muscat of Alexandrias were very fair. Small plantlets of *Pandanus gracillima* in thumb pots, together with *Smilax* and coloured Vine leaves, were placed in front, and added to the effect. He also showed fruiting plants of *Callicarpa purpurea*, the magenta-purple flowers being in clusters on slender stems at intervals. (Silver-gilt Knightian Medal.)

E. C. Hambro, Esq. (gardener, Mr. Wm. Beale), Hayes Place, Hayes, Kent, staged ten bunches of Black Hamburg Grapes, all from Vines in a cool house, and they were as black as Sloes, even in size, finely shaped, and in all respects excellent in appearance. (Silver Knightian Medal.)

Bottles of Elderberry syrup were shown by Mrs. Sophia Miller, Moylem, Marlow. She had the following note:—"Elderberry syrup may be taken as a liqueur. Two tablespoonfuls added to a tumbler of boiling water make an excellent drink for colds and cold weather."

Messrs. J. Veitch and Sons, Limited, staged a new variety of Apple named "Middle Green," from Frogmore Prolific and Blenheim Orange. It is a beautiful Apple of medium size, smooth and roundish, with clear yellow skin, crimson on the sunny side. The eye is in a small depressed cavity, with a characteristic tiny rise at one side. The characters of the parents seem well blended. The fruits are odorous and attractive in every way, and it is likely to be a first-rate dessert Apple.

Messrs. Dobbie and Co., from Rothsay, sent Dwarf Blood-red Cabbages, neat and solid; also Dobbie's Large Red Shallots (from seeds sown in March, 1900), and others from bulbs planted in February.

Strawberry St. Joseph came from Mr. Harris, The Gardens, Bucklebury Place, and the fruits were well flavoured. Mr. John Gregory, 60, Canterbury Road, Croydon, sent a jar of green Tomato pickle, the receipt for which we hope to print. He had a vote of thanks awarded. A boxful of Gordon Castle Plums (like a Japanese or Kelsey Plum in shape and colour) came from Mr. Chas. Webster, Gordon Castle Gardens, Fochabers, N.B. Strawberry-Raspberries were shown from Mrs. Gleadow, Ladbrooke Grove, W.

Winter-garden at Moulton Paddocks, Newmarket. (See page 346).

Richardson & Co.

Richardson &amp; Co.

Winter Garden in the Public Park, Wolverhampton. (See page 346.)

**Floral Committee.**

Present: Wm. Marshall, Esq. (in the chair); with Messrs. H. B. May, Chas. T. Druery, Geo. Nicholson, R. Dean, James Walker, Amos Perry, John Gunn, J. F. McLeod, Wm. Howe, G. Reuthe, John Jennings, Chas. Dixon, J. A. Nix, Chas. Jefferies, C. J. Salter, Wm. Cuthbertson, Chas. E. Pearson, R. C. Notcutt, Chas. E. Shea, W. P. Thomson, E. H. Jenkins, Chas. Blick, Ed. Mawley, and Geo. Paul.

Mr. John Russell, Richmond, opened the autumn season by a wonderful exhibit of *Aucuba vera*, the plants a foot high, covered with clusters of scarlet berries. From Mr. Amos Perry, Winchmore Hill, came an interesting exhibit of *Polygonum molle*, *Aster versicolor*, also two fine forms of *Aster Amellus*. That labelled No. 1 is certainly in advance of many named varieties. Begonias were well displayed by Mr. A. L. Gwillim, Cambria Nursery, New Eltham, Kent, the exhibit being chiefly formed of singles arranged in colours. They undoubtedly bore evidence of good culture and a fine strain. Messrs. J. Jefferies and Son, Cirencester, contributed four boxes of Roses, exhibited in first-rate style for the present month. The best were John Ruskin, Mrs. Sharman Crawford, Louis Van Houtte, Mrs. J. Laing, Madame Hoste, Comte Raimbaud, Ellen Drew, and Ulrich Brunner. (Silver-gilt Banksian Medal).

Messrs. Jas. Veitch and Sons, Ltd., Chelsea, made a large display of Begonias of the winter-blooming type. The varieties were *Agatha Compacta*, a delightful dwarf blooming pink; *Ideala*, a bright rosy red with much larger flowers; *Agatha*, pink; and Mrs. Heal, crimson, the most attractive of all. The same firm also displayed a small group of *Dædalacanthus parvus*, a dwarf plant with violet flowers, together with a collection of Zonal Pelargoniums, the best varieties being *Snowdrop*, *Florence Miskin*, *Conan Doyle*, *Lord Curzon*, *Dryden*, and *Mary Seaton*. (Silver-gilt Flora Medal).

From Messrs. J. Peed and Son, West Norwood, there also came a nice exhibit of winter-flowering Begonias, which were represented by well flowered plants of Turnford Hall and Mrs. Leopold de Rothschild, while boxes of *Streptocarpus* hybrids and a good strain of *Gloxinias* completed a nice display. Mr. G. Reuthe, Keston, Kent, made a small exhibit of *Asters*, *Nerines*, *Crocus speciosus*, and plants of *Shortia galacifolia*.

Mr. E. C. Lawson, 32, Ashley Road, Hornsey Rise, exhibited a new tree tie, the invention of Mr. Edwin Beckett, which is simplicity itself, consisting of strong brown webbing with a buckle, which is easily adjusted.

A glorious exhibit of *Dracæna Victoria* was staged by Messrs. W. Bull and Sons, King's Road, Chelsea. These were all specimens, excellently coloured, and with every leaf perfect. (Cultural Commendation).

Messrs. J. Cheal and Sons, Crawley, still maintained the popularity of that autumn flower the Dahlia. They were chiefly singles, although there were two boxes of pompons richly

coloured. The most conspicuous singles were *The Bride*, *Lord Rosebery*, *Amos Perry*, *W. C. Harvey*, *Duke of York*, *Meta*, *Princess of Wales*, *Hilda*, and *Beauty's Eye*. (Silver Flora Medal.) Messrs. Hobbies, Ltd., Dereham, made a nice display of *Cactus Dahlias* (Silver Banksian Medal), and Messrs. T. S. Ware, Ltd., Feltham, exhibited grand decorative exhibit of Dahlias. The mounds consisted of excellent varieties arranged with autumnal foliage. A few of the best were Mrs. Winstanley, Zephyr, J. H. Jackson, F. A. Wellesley, Galliard, C. G. Stredwick, H. J. Jones, and Alpha. (Silver-gilt Banksian Medal.) Mr. H. B. May had *Bouvardias* and Ferns.

Messrs. Ambrose and Sons, Cheshunt, contributed a miscellaneous display consisting of *Begonias Gloire de Lorraine*, and Turnford Hall, good pots of *Lily of the Valley*, *Liliums* in variety, *Azalea mollis*, and *Spiræa japonica*; also an exhibit of the new *Grape Melton Constable*, with a few Apples and Roses. (Bronze Flora Medal).

Mr. M. E. Mills, gardener to F. Lloyd, Esq., Coombe House, Croydon, staged a group of *Begonias* of the *Gloire de Lorraine* type, the pink form staged being a reversion from *Caledonia* to the hybrid form.

Messrs. G. Bunyard and Co., Ltd., Maidstone, had a large display of hardy autumn flowers comprised chiefly of *Asters*, in which were noted *A. horizontalis*, *A. Shorti*, *A. Amellus*, *Framfieldi*, *A. A. Onward*, *A. cordifolius Photograph*, and *A. rubra*.

Messrs. W. Cutbush and Son, Highgate, made perhaps the most artistic display in the hall, composed as it was of perennial *Asters* in variety, arranged in large groups on the ground floor, which displayed most effectively the varieties staged. A few of the most prominent were *A. cordifolius elegans*, *A. Delight*, *A. King Edward VII.*, *Triumph*, *Osprey*, *Duchess of Albany*, and Mrs. Raynor. (Silver Banksian Medal).

**CHRYSANTHEMUMS.**

Chrysanthemums formed a prominent feature of the meeting. Mr. E. Potten, Camden Nursery, Cranbrook, made a nice display of cut varieties, the chief being *Harvest Home*, *White Quintus*, *O. J. Quintus*, *Mons. E. P. Van Geert*, *La Pactole*, *Nellie Brown*, *Goacher's Crimson*, and *Roi des Blanches*.

There were two really good groups of plants exhibited. The first to be noted were from Messrs. Jas. Veitch and Sons, Ltd., Chelsea, who put up a large collection, which ought to have had a larger space allotted it. The plants were well grown, and the flowers excellent, a few of the most attractive being *Britannia*, *Miss Cicely*, *Louise*, *Calvat's '99*, *Henry Perkins*, *Miss R. Hunt*, *Miss Elsie Fulton*, and *Miss Olive Miller*. The flowers were of exhibition quality.

Messrs. J. Peed and Son, Norwood, made a pretty group of Japanese varieties, the best being *Miss Cicely*, *Lily Mountford*, *Ernest Bettisworth*, *Mrs. T. W. Pockett*, *Marquise V. Venosta*, and *Baden Powell*. (Silver Flora Medal).

From Messrs. W. Wells and Co., Ltd., Earlswood, Surrey, came

a nice display of early-flowering varieties, with a few specimen blooms of the Japanese. The best early varieties were "Cactus," La Pactole, Reggie, Carrie, Rosie (a grand buff), Polly, and groups of promising single seedlings. In the large flowered section, Merstham Yellow was the most prominent. (Bronze Banksian Medal).

Mr. W. J. Godfrey, Exmouth, Devon, made a good exhibit of Chrysanthemums in a cut state. The most noteworthy decorative varieties were Decorator (a promising bronze), Pink Beauty, Safeguard, Harry Gover, Mons. Mestivier, and La Pactole. (Bronze Banksian Medal).

#### Certificates and Awards of Merit.

*Apple, Middle Green* (J. Veitch and Sons, Ltd.).—A medium sized, yellow-skinned, odorous dessert Apple, from Frogmore Prolific and Blenheim Orange. A.M.

*Lælio-Cattleya Norba superba* (J. Veitch and Sons, Ltd.).—Parentage: C. Mossiae and L. xanthina. The sepals and petals are a pale bronzy-tea colour, very sweet and pretty. The lip is fluted, opening in front, and is delicately coloured light mauve-purple, the throat being yolk-of-egg hue. A.M.

*Melon, Barnes' Fiscal Problem* (Mr. W. Barnes).—A large-sized, creamy coloured, netted Melon, with deep red flesh. Excepting for the name, we are full of praise for it. A.M. From A. T. Walter, Esq., Bear Wood.

*Nephrolepis Mayi* (H. B. May, Edmonton).—The pinnae or leaflets are tortuous, and inclined to become crested. Large plants will doubtless be handsome, but in a young state the fronds are stiff and held erect. F.C.C.

#### Cardiff Gardeners'.

The first meeting of the session took place at the Grand Hotel, on Tuesday, October 6, when J. Lynn Thomas, Esq., C.B., F.R.C.S., J.P., presided over a very large attendance. Mr. John Basham, F.R.H.S., delivered a lecture, entitled "Notes on Hardy Fruits, especially Apples and Pears."

After addressing the audience at some considerable length on the history of the Apple, pointing out districts that centuries ago were conspicuous for their beautiful and fruitful orchards; but during the time of the Civil Wars great damage was done to them. Unfortunately since then no one seemed to have replenished these orchard plots. Mr. Basham did not hesitate in saying that better Apples had been grown in the Valley of Glamorgan than in any other part of the world; yet, he said, people do not plant, owing chiefly to the insecure holdings of tenancy.

Twenty excellent dishes of very fine Apples and Pears were staged by the lecturer, which illustrated the fact that they were not only larger, but better in flavour, than is generally the case with imported ones. After such a lengthy lecture, full of interesting and historical details, Mr. Basham was accorded the best thanks of the meeting, and was also unanimously awarded a First Class Certificate for the collection of fruit. Mr. F. G. Treseder was also awarded a First Class Certificate for a new type of Dahlia, viz., a Cactus pompon "Mary." A unanimous vote of thanks was accorded the president.—J. JULIAN.

#### Scottish Horticultural.

The October meeting of this association was held in Dowell's Rooms on the evening of Tuesday last. Mr. Moir, gardener, Roselagh, Inverness-shire, read a paper on "Pear Trees on Walls," a paper full of sound practical commonsense instructions as to his growth of Pears on the cordon system, which he believed to be the best for general purposes. He recommended Pears on the Quince stock. With such cordons he gets quickly a crop of fruit, and soon covers his walls. It matters little whether they are oblique or perpendicular; but for walls of 12ft or less he preferred them oblique. The soil he recommended is old turf, with a little bonemeal, keeping the roots from going down to the subsoil. He strongly recommended thinning of both blossom and fruit, protecting from frost, syringing with some insecticide, such as quassia extract, and root-pruning after fruit is gathered. The paper was of a most interesting description, and was appreciatively listened to. In after discussion Mr. Grieve, Mr. Johnstone, and Mr. Mackenzie took part. A very warm vote of thanks was awarded to Mr. Moir.

Mr. Moir, in illustration of his paper, exhibited a large and very excellent display of fruit—Apples, Pears, Apricots, and Peaches—which showed evidence of very high culture, and quite astonished the members present. For size and colour these could not be readily surpassed in any climate or in any season. There were in all sixty varieties, some of the chief of which were Pears: Beurré Spring, Emile d'Heyst, Marie Benoist, Pitmaston Duchess (from pots and wall), Fertility, Easter Beurré, Beurré Baltet père, and Uvedale's St. Germain. Apples: Worcester Pearmain (extra good), Peasgood's Nonesuch, Allington Pippin, Newton Wonder, Manx Codlin, New Hawthornden, Ribston Pippin, &c.; also Diamond Peach, and Moorpark, Gros Peach, and Breda Apricots. A special silver medal and cultural certificate was awarded Mr. Moir for the collection. Messrs. James Grieve and Sons exhibited a plant of Marie Massé Chrysanthemum, showing a beautiful pure white sport, which at the

meeting was named White Duchess. This was much admired and awarded a first class certificate. Mr. Brown, gardener, Silverknowe, Edinburgh, exhibited an interesting collection of leading varieties of early Chrysanthemums. Mr. Johnstone, Hay Lodge, sent a stem of *Pleroma* (*Tibouchina*) *sarmentosa*. Mr. Todd, Shandwick Place, exhibited a very handsome bowl of *Harpelium*. Miss Mellish arranged most artistically in a large sized "Floral Aid" stand. The president was awarded a vote of thanks at the close of the meeting.

#### Beckenham Horticultural.

The first lecture of the session ("Spraying Fruit Trees and Packing Apples as Practised in Canada") was delivered by Cecil H. Hooper a day or two ago. The lecturer said that spraying is much more practised in Canada and the United States than in England, one reason being that insect pests appear to be more destructive there than here, owing to the very large breadths of fruit trees. He mentioned one owner who had 1,600 acres of Apple orchards, trees being planted at 30ft to 40ft apart, and spraying can be done most economically by using horse labour. The lecturer had with him a collection of photographs illustrating the various stages when flower buds, &c., should be sprayed. Several recipes were given (with cost) to bring about the destruction of biting and sucking insects. Mr. Webster, Kelsey Park, placed on the table ripe fruit and foliage of *Monstera deliciosa*, which attracted attention. At the close, hearty votes of thanks were awarded to both lecturer and chairman.—T. C.

#### Trenching and its Advantages.

This was the title of a paper read before the members of the Reading and District Gardeners' Mutual Improvement Association on the 28th ult. by Mr. W. Turnham, The Gardens, Culham Court, Henley-on-Thames. The subject was treated in a most practical manner under the following headings:—Inversion of soil; Tentative deepening or mixing, and the usual way of keeping the top spit in its natural manner on the top and breaking up the subsoil. Special attention was directed to the fact that trenching was one of the most important operations within the whole range of horticulture, and that the very germ and substance of good trenching was to add to the bulk of the cultivated earth, and improve its quality by converting a certain amount of hard subsoil into porous surface soil. Needless to say, that with such a subject a lively and interesting discussion followed, in which Messrs. Powell, Neve, Townsend, Hinton, Cox, Tunbridge, Bright, Martin, Wilson, Judd, Exler, Herridge, Dore, and Foster took part. The Society's certificate was awarded to Mr. E. S. Pigg, Ropley Lodge Gardens, Alresford, Hants, for a group of splendidly-grown plants of *Primula obconica rosea*. The individual flowers were very fine, and of a deep rose colour. Mr. J. L. Nash, of Bulmershe Court Gardens, staged a dish of splendid Tomatoes, Best of All, and Mr. Durrant, The Gardens, "Preston," vases of Dahlias and Chrysanthemums.

#### Weather Notes.

##### Great Rains and High Winds.

Enormous destruction has again been caused by wind and rain throughout the entire kingdom within the past week. Rivers are all in spate; low-lying regions are flooded; corn crops that were cut and stacked have in places been swept away; and as the Scottish weather notes show, much of the harvest in North Britain is still uncut. Within a few days the year 1903 will show the highest rainfall since the Meteorological Office was established in 1866. The highest fall experienced since that year was in 1879, when in London it registered 31.99.

##### Notes from Newton Mearns, near Glasgow.

Summer has entirely gone, that is to say, the season we call summer. We have had no summer this year, and here autumn is on us all at once. We scarcely can think that it is only three months back when we had the longest day. However, in spite of it all, the country is looking fine at present. The flowers are now gone, and if it were not for a good bloom of a Rose here and there, we may say that winter is here. The frost of two weeks ago blackened everything, and again on Saturday last, 6deg were registered, putting an end to those flowers fortunate enough to stand the spell of frost preceding. Rain has fallen intermittently since the month came in, and it is pitiful to see such a large amount of grain standing out in it all. In some places cutting has not been completed. I fear that unless good weather sets in at once, there is little hope of saving what grain is out. To-day (Monday, October 12) it is simply pouring, not to speak of yesterday; and after Friday and Saturday's good weather it was expected that the harvest would be continued in fair conditions, but, alas! we perhaps should say, "Old times are changed, old manners gone."—N. R.

### Hardy Fruit Garden.

**CHECKING THE WINTER MOTH.**—From the present time until the end of the year the winter moth is on the wing, but it is only the male moths which fly, the females being only furnished with rudimentary wings, consequently they have to crawl up the stems or trunks, of Apple trees chiefly, for the purpose of depositing their eggs. It is while in the act of ascending the stems that means should be taken to trap the female moths. This is best done by tying grease-proof paper round the trunks a few feet from the ground in the case of standard trees, but necessarily lower with bush trees, and smearing this well over with ordinary cart grease, or Horne's fruit tree dressing. In attempting to cross the band of grease the moths are trapped, also should they pass underneath the paper, their progress is stayed by the tie which bars the way. Although the moths are not general until November, it is desirable to place the bands early so as to catch the first on the move. The grease will dry up in time, but before this happens smear the bands with a fresh supply; in fact, keep the surface of the paper in a sticky condition. A flat knife may be used to lay on the grease, which should be in a condition that it does not run.

**PREPARATIONS FOR PLANTING FRUIT TREES.**—The most important matter requiring attention prior to planting any kind of fruit tree or bush is the due preparation of the soil. Where any large plot of ground is to be devoted exclusively to fruit, the best method of preparation is to trench the ground, not doing so and bringing up inert material to the surface, but deepening the whole bulk two spits deep by the process known as bastard trenching. Briefly described, this is a method of trenching whereby two spits of soil are moved, but still holding the same relative position. Only in very poor material should manure be applied, and then only liberally for small bush fruits and Strawberries. Rich soil in the case of Apples, Pears, and stone fruits, producing over-luxuriant growth. Where a tree here and there is only required to be planted stations of sufficient size may be prepared. These will suffice if 6ft or 8ft in diameter. Break up to a good depth, and place in drainage, if the ground is waterlogged, or raise the soil above the natural level. For planting trees against walls a width of border should be prepared of 3ft to 6ft. The former will do for cordons, the latter for fan-shaped and horizontally trained specimens. All details as regards the soil having been settled, there still remain several minor points to be seen to. Tall trees or standards will require stakes, and these should be provided in readiness, together with ties and straw or strips of canvas to prevent abrasion of the bark. Some flaky manure to spread over the roots as a mulching is necessary also.

**THE TREES ON ARRIVAL FROM THE NURSERY** must be carefully unpacked, the roots pruned, and spread out carefully in a trench of moist soil to recover somewhat before the final planting, which, of course, may be delayed by the weather. Under this treatment the trees will not suffer, but may be forming young fibrous roots.

**THINNING ORCHARD TREES.**—Trees standing too thickly upon the ground in orchards are not, and cannot be, productive. They are simply spoiling each other by the wholesale exclusion of light and air. In such cases drastic measures are necessary. First of all the trees themselves should be thinned so as to leave space all round each. Then will follow the thinning out of branches; but too much ought not to be effected at once. A little readjustment may be made, and dead or very weakly wood removed. This will suffice for one season. A more general thinning and regulation may be effected where no previous thinning of trees has been necessary.

**WALL TREES.**—Branch thinning and spur thinning may well be carried out this month. The branches of horizontally trained trees are frequently too closely together, and this is most apparent when the spurs are elongated, so that those proceeding from one branch compete with those from others. Branches, however, should not be too thickly placed if not nearer each other than a foot. Crowding most likely is then caused by the nearness together of clusters of spurs. Take the opportunity to first thin these out, and then to shorten the most prominent and the least fruitful parts. By carrying this out for a few years a gradual improvement will be effected.

**FAN TRAINED WALL TREES** must also be examined, removing crowded branches and shoots, weakly and useless spray, exhausted and debilitated growths. If spur growths are present as they may be on trees not wholly confined to being furnished with young shoots, as Peaches and Nectarines usually are, they

should be gradually reduced in length so as to keep the spurs close to the wall. The trimming and pruning effected will necessitate the re-arranging of the trees on the wall or fence. This will permit of giving full effect to the principle of allowing ample space for all the main bearing parts, and ensuring good crops.—**EAST KENT.**

### Fruit Forcing.

**VINES FOR STARTING IN DECEMBER.**—Pruning, if not already done, must not be further delayed, as early and complete rest for a few weeks contributes to an even break. Pruning to two buds is usually followed by a good show of useful bunches, but if such has not been so in previous years, or larger bunches are desired, the shoots may be left a little longer, or pruned to the most promising bud near to the base. What, however, is gained in size of bunch is usually lost in compactness thereof, unevenness of berries, and bad finish. Besides, bunches of 1lb to 2lb weight are quite large enough for early Grapes.

Remove any loose bark, but avoid the close peeling and scraping that injures the rods, and wash them with tepid soapy water, 4oz paraffin softsoap to a gallon of water, or where there has been red spider, 1oz caustic soda and 1oz pearlash to a gallon of water, or where there has been fungi trouble use a solution of sulphate of copper, 1oz to 1½ gallon of water, apply carefully, but just wetting every part with a brush moistened in the solution. Thoroughly cleanse the woodwork of the house and limewash the walls. Remove the surface soil down to the roots, if not to the whole extent of the border, for a distance of 3ft or 4ft from the stem, and supply fresh loam so as to encourage new fibres, and an extension of fresh roots from the collar, adding about a quart of steamed bonemeal and a gallon of wood ashes to each three bushels of loam, or supply some approved fertiliser, according to the instructions. Keep the house cool, dry, and airy until the time arrives for starting.

**HOUSES OF RIPE GRAPES.**—Thin-skinned Grapes are more susceptible to cold and damp than are the thick-skinned Grapes. This applies equally to Black Hamburg and similar kinds, as to Muscat of Alexandria and Madresfield Court; but Hamburgs do not require a temperature of over 45deg for good keeping, and there must not be any deficiency of moisture at the roots, otherwise the Grapes will shrivel. Lose no opportunity of giving air when the days are fine, turning on the heat so as to cause a gentle warmth in the hot-water pipes.

**LATE GRAPES.**—Thick-skinned Grapes require time to mature after they are ripe. Alicante, however, improves nothing whatever in keeping, and is at its best as soon as well ripened, and the same may be said of Gros Maroc.—**ST. ALBANS.**

## Young Gardeners' Domain.

### The Winter Season.

This is the season of long nights and shortened days; and during these evenings of lengthened leisure and freedom from work in the garden, the Editor would again extend the usual invitation to the men of the bothy, to send short notes on the subjects with which they are chiefly engaged. We have had a letter on the bothy question during the past week; but that matter, we think, was sufficiently debated in these pages last spring, and for the nonce, may be left at rest. Would writers please confine their efforts to from 300 to 500 words, writing clearly, and only on one side of the paper? Horticulture is wide, and its phases are numerous; the choice of a subject cannot be difficult.

**OLD ENGLISH GARDEN BOOKS AND GARDENING TO THE END OF THE 17TH CENTURY.**—The first monthly meeting of the present session of the Isle of Wight Horticultural Association was held at Warburton's Hotel, Newport, under the presidency of Dr. Groves, J.P. After the reading of the minutes of the last meeting, and reports of the Association Excursion to Ryde, and of the recent Sweet Pea Show having been approved and confirmed, the Chairman, in the course of a stirring address, congratulated the Association on the progress made. Subsequently he read a most interesting and instructive paper, entitled "Old English Garden Books and Gardening to the End of the 17th Century." The doctor prefaced his paper by remarking that to fully comprehend things of the present we must be well conversant with the past history of the subject dealt with, so that the standard of to-day might be judged by the standard of time. In concluding his review of Old English garden literature and his delightful excursions into Old English gardens, Dr. Groves remarked that when we read old gardening books we are inclined to say, "There is nothing new under the sun." The certificates at the Sweet Pea Show were distributed to the successful exhibitors. Two new members were elected. The next meeting will be at Warburton's Hotel, when Mr. J. H. Silsbury, of Shanklin, will deal with "Chrysanthemum Culture."

# THE BEE-KEEPER.

## Feeding.

The honey flow of 1903 has practically ceased, and many imagine that feeding with syrup must of necessity follow. This is a mistaken notion arising from ignorance of the causes of feeding, which are, 1. early in season to stimulate brood rearing, and 2, in the autumn for the same reason, and because the hives have an insufficiency of stores. Do it as you will it is a very sticky task, expensive, and often causes robbing. There is nothing to beat a good supply of sealed honey in the brood chamber, and if this course can be adopted loss of bees by dwindling or starvation is almost an unknown thing.

There ought not to be less than 20lb. of sealed stores in the hives, but 25lb. would be safer. Remember, the stronger the colony the better it will winter, and the less stores will be consumed. Having settled the question of whether to feed or not to feed, if the latter be necessary, make good syrup made from the best granulated sugar, giving a wide berth to treacle and poor cheap sugar. Take 10lb of the best granulated sugar, add 5 to 7 pints of water, and place on a slow fire, and heat to 170deg to 180deg, and stir all the time. Some people boil it, but burnt syrup will bring death in its train to any colony consuming it. Do not make the syrup too thick, i.e., more than half and half during September, but if feeding be absolutely necessary, and this is only through sheer neglect, in October, then make it in the proportion of 8 to 6. The reason why thick syrup feeding is not advisable is being thick it will granulate, and in this form is no use to the bees, for they will only carry it out when the opportunity arises. Avoid the addition of chemicals which are advertised to prevent and cure foul brood.

**THE FEEDER.**—No expensive feeder is needful, take a 3lb jam bottle, fill it up to the brim, and stretch over tightly, tying firmly with string, some cheesecloth or muslin. Place the inverted bottle over the frames, taking great care to spill none, and close the entrances so that one bee only can pass at a time. It is well not to put on cold syrup, as this reduces the temperature of the brood chamber, and will not be taken down so rapidly as lukewarm syrup. Wrap up the whole snugly, and fill every bottle up to the brim: if not, then the syrup will run out, for it will be forced down by the air above. One warning more and I have finished: feed at night, and this will assist to prevent robbing.—HYBLA.

## Robbing.

When the honey flow begins to fall off, then look out for robbing. If it can be checked in its early stages, then it may soon be cured.

**CAUSES.**—It is seldom that bees resort to robbery during the time that there is plenty of work for them in the fields. Like man, they get into mischief during the time of idleness and leisure. Strong colonies are never robbed, and but only the weak and queenless hives. So a strong colony pays in two ways, first there is more surplus, and second there is less worry and care needed at the close of the honey harvest. One of the chief causes is leaving pieces of comb containing honey about the hives.

**HOW TO DETECT IT.**—There is generally a great deal of agitation on the alighting board, and bees may be seen struggling with each other, and rolling off, holding one another tightly the while.

**HOW TO CHECK IT.**—It is usually best to close the entrances so that one bee only can pass at a time. Very seldom is it that this fails, unless the stock be queenless, and then they seem to lack the energy necessary to protect their stores. In this case the remedy is clear, either unite them to a strong or even a weak stock, and thus help the weak to become powerful against a similar attack. A "V" shaped entrance will sometimes be very

"V"-shaped hive entrance.

helpful, and this must only be wide enough to allow one bee to pass at a time.—HYBLA.

## Modern Bee-keeping.

At a meeting of the Society of Arts held in London some time ago, Mr. Walter F. Reid, expert of the British Bee-keepers' Association, read a paper on Modern Bee-keeping. Mr. Reid traced the industry of bee-keeping from the earliest times. Bee-keeping, he said, was one of the oldest, if not the oldest, of all the industries connected with agriculture. He described the progress in the construction of the hive and the different hives in common use. There could be no doubt that bee-keeping in most rural districts was remunerative. An apiary was started in 1894 by two factory workmen, who bought a "skep" of bees on joint account. They had now twenty-four

stocks, which yielded on an average 56lb of honey per hive. But, said the lecturer, there was a larger and more important question connected with bee-keeping, namely, the fertilisation of blossoms and the production of fruit and seed.

A large grower of bush fruit in Hertfordshire established an apiary in his grounds, and at once found that his produce increased more than fourfold. As he now sent off six to ten tons of Gooseberries per week during the season, the money value of his bees was not to be estimated by the yield of honey alone, although this was also considerable. It had been found that some of our most highly cultivated fruits were not self-fertile; that was, the blossoms on a tree would not fertilise each other, but must receive pollen from another tree before they could bear fruit. This was the cause of the absence of fruit in many trees that blossomed luxuriantly, especially when planted singly in small gardens. What agent more suitable than a bee could be found to bring the golden dust upon which the future crop depended?

## Meteorological Observations at Chiswick.

**COMMUNICATIONS RECEIVED.**—Rev. C. H. B., Rev. P. R., H. M., J. Kennell, O. T., E. Molyneux, J. S., R. P., J. T., H. B., J. Pegler, D. I., J. W., R. P. B., M. T., E. Mawley, R. and Co., H. S., with thanks, will use them; J. A. S., R. D., H. D., J. J. W., G. E. S., C. H. B., J. McI., G. R., K., Dublin; T. A. W., W. B. B., Rev. J. H. P., W. T., J. R. S. C., T. and Sons, C. W. M., Newcastle; W. S., M. and M., R. J. and Sons, Ltd., W. C.

**THE REPRODUCTIVE POWER OF TURNIP SEED.**—Writing to the "Gardener's Chronicle," Mr. Wm. Cuthbertson says: When harvesting Dobbie's Golden Ball Turnip seed this summer at Orpington, I was struck with the appearance of a remarkably fine plant. I had it saved by itself and threshed out. The weight of seed was 8½oz. I counted the seeds in 1-16th of an ounce, and found they numbered 1,120, which works out at 147,840 for the 8½oz. Thus a single seed sown in July, 1902, has reproduced itself 147,840 times in twelve months."

**GREAT LONDON SUCCESSES.**—We have received the following note: "In the large open competition of the British Dairy Farmers' Association, held in the Agricultural Hall, London, last week, some of the most important prizes for roots were won by the produce of Webbs' seeds, viz.: First, second, and third prizes, Webbs' Mammoth Long Red Mangold; first prize, Webbs' Smithfield Yellow Globe Mangold; first prize, Webbs' Imperial Swede; and second prize, Collection of Webbs' roots. There were 143 entries for these prizes, and considering the strength of the classes, the remarkable success of Messrs. Webbs' seeds must be very gratifying to this firm."

## TO CORRESPONDENTS

\* \* All correspondence relating to editorial matters should be directed to "THE EDITOR," 12, MITRE COURT CHAMBERS, FLEET STREET, LONDON, E.C. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense. In naming plants we only undertake to name species, or well-marked varieties, and only six on any one occasion. Florists' flowers we do not name.

**STORING GERANIUM ROOTS (C. A. S.).**—The plan adopted by gardeners is to lift the plants at this time of year; trim off some of the sappy growths, and a few of the roots; "box" them off; that is, plant them in wooden boxes of 4 in to 5 in depth, and well drained, boards being nailed transversely across the bottom of the boxes to keep them above the ground. The soil used is of a light, fibrous character, having 50 per cent. of sand and leaf mould, the rest any light soil mixed with some turfy loam. Water the roots when they are set in, but after they show signs of having become established in the boxes keep them almost dry through the winter. They like a light, cool, dry frame or house. We have seen pot plants kept in cupboards without a drop of water for some months, and they break away when repotted in spring, but have not attempted this with freshly-lifted plants. It is remarkable, however, to note the persistence of life in the shrivelled stems of Geraniums that are bunched and hung up to dry.

**TREATMENT OF CRIMSON RAMBLER ROSE (T. Q.).**—This Rose, like most of the climbing Roses, is best treated on the biennial system, namely, taking young shoots each year from the base of the plant, or that of the forking of the main branches, and when the flowering is over, or not later than the falling of the leaves in autumn, cutting away the flowered branches in favour of the shoots produced during the summer. Thus, the shoots produced one year flower in the following summer, on growths produced from them laterally, other growths to take their places are retained, and the two years old is cut out at the winter pruning, and the young, strong, well-matured growths trained in their place, only the immature points of the shoots being shortened to thoroughly ripened wood. You will, therefore, cut out the branches that have flowered wonderfully during the past summer to long and vigorous growths of the current year, and train them in place of those cut out at about 1 ft distance apart on the wall space, shortening those retained at the limit or a few inches shorter, that is, at the top of the wall. This is simply the procedure adopted with Raspberries, and modified so as to keep the wall or other surface duly furnished with bearing or flowering growths year by year.

**CRACKING OF FRUITS OF WALTHAM ABBEY SEEDLING APPLE (A. W. H.).**—The specimen is affected by Apple scale (*Fusicladium dendriticum*), the most injurious of fungus parasites attacking the Apple, in many instances ruining half or more of the entire crop, and also injuring the growth of the tree, as it attacks the leaves and shoots as well as the fruit. The fungus, as a rule, first appears on the leaves under the form of small, roundish dark spots, mostly on the upper surface. These spots rapidly increase in size, especially during wet, cold weather, run into each other and form large, irregular-shaped blackish blotches. In some cases the young shoots are affected and more or less injured. The fungus passes from the leaves to the fruit, or both may be affected simultaneously, the dark-coloured mycelium spreading on the leaf or fruit between the cuticle and epidermis, and the cuticle is eventually ruptured, and short branches protrude, each bearing a conidium or spore at its tip. The disease is extended through the season by means of these conidia or spores. The disease is carried over the winter by means of the mycelium present in fallen leaves or fruit, and, according to Goethe, an ascigerous form of fruit is produced on the diseased patches, especially of young wood, which matures in spring. The preventive means are:—Spray with Bordeaux mixture; first, just as the flower-buds begin to open; second, when the petals of the flowers are falling; and third, when the fruit is the size of Peas or slightly larger. If the season be rainy a fourth treatment should be given a fortnight after the third. Bordeaux mixture at ordinary strength, however, is apt to scorch the foliage, especially when young, hence it is advisable to use a dilute mixture, say, 1 oz of copper sulphate and 1 oz. of quick-

lime to each gallon of water. It is excellent practice to spray in late winter or very early spring, before the buds begin to swell, with a simple solution of copper sulphate, 1 oz to 1½ gallon of water, and afterwards follow as before advised with dilute Bordeaux mixture, ascertaining a safe strength before applying generally, so as not to scorch or injure the foliage.

**VINES NOT RIPENING THE WOOD (J. T.).**—Any that are not yet brown and hard in the wood should have a temperature of 60 deg to 65 deg by artificial means, with a little air constantly. The heat from sun influence may run up to 85 deg or 90 deg, only let there be enough air to insure a circulation. The laterals should be reduced by degrees, bringing them down to the pruning buds, and when there is no danger of starting these, the shoots may be shortened to about two leaves above the pruning buds. This will cause the latter to plump, and by keeping the house rather warm by day, with ventilation, and turning off the heat at night, with free ventilation, the Vines will go to rest.

**IRIS LEAVES GOING OFF (S. P.).**—Yes, the Iris leaves are affected by a black mould closely allied to the fairy ring of Carnations, and often disfigures and destroys the leaves of cultivated Iris, Hemerocallis, &c. The mycelium is localised, but as the diseased spots are often abundant, and also large, attacked leaves soon die. The spots, at first pale, elliptical, brown with a darker margin, eventually become studded with minute olive-brown tufts of conidiophores, bearing the large warted conidia of spores at their tip. This is the fruiting stage of the fungus (*Heterosporium gracile*, and later on minute sclerotia are formed in the dying leaves, the parts having a dark or black mouldy appearance. It is important, therefore, to collect and burn all the diseased leaves, and this being done the disease does not spread and the danger of its occurrence the following season is much diminished. Spraying with ammonical carbonate of copper solution has been found to check the disease, and probably this would be desirable in your case, so as to prevent the germination of any spores or conidia that may be dispersed in removing this affected leaves. Clearing away diseased leaves and burning them is the chief thing to be attended to now. Probably the wet weather has severely weakened the plants and rendered them more susceptible to disease. We have found dusting with newly-slaked lime useful, and this we should do after well trimming the plants from all diseased parts.

**SPOTS ON GRAPES (H. J. M.).**—The Muscat of Alexandria Grapes are affected by what is known as "spot," and caused by a fungus named *Gloeosporium ampelophagum*, or, according to some, *G. laticolor*. It occurs on the young shoots, leaves, and fruit, but commonly in this country on the fruit, and causes a "spot," not unlike that resulting from scalding or swelling berries, and on the ripening or ripe Grapes a brown discoloration, and the affected berries soon rot. It is probably induced by a close, moist atmosphere, at least it does not occur under freely ventilated atmospheric conditions, and this especially in the case of Muscat of Alexandria is particularly desirable. The prevention of moisture being deposited on the ripening or ripe berries is imperative, a little air being given constantly with a gentle warmth in the hot water pipes, increasing the ventilation early in the morning so as to dissipate the moisture, and allow the Grapes to heat evenly with the atmosphere, and thus preventing the deposition of moisture on the berries the Grapes do not "spot." It has been found of service to dress the Vines when resting with a solution of iron sulphate, 1 lb to a gallon of water. The mealy bug would not affect the Grapes in the matter of spotting, but it should be destroyed, as it spoils the Grapes by its excrementitious matter.

**NAMES OF PLANTS.**—*Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number.* (J. F.).—*Aster linosyris*. (F. L.).—1, *Aster patens*; 2, *A. longifolius*; 3, *A. Novi-Belgi* "Neptune"; 4, *A. diffusus horizontalis*; 5, *A. patulus*; 6, *Saponaria officinalis* fl.-pl.; 7, *A. Amellus*. (N. ## Manuring Potatoes.

In the year 1900 a very large number of experiments were conducted on Scottish farms, under the auspices of the West of Scotland Agricultural College. The tests covered the fattening of sheep and cattle; the manuring of hay, Turnips, and Potatoes; rotation manuring; and the comparative merits of varieties of Oats. The official report (which we have read with great pleasure and interest) is a most exhaustive one, and well worthy of the attention of all agriculturists. But there are some results of these experiments which are so striking as to justify special mention here. These are connected with the manuring of Potatoes, and are the more remarkable inasmuch as the experiments with manuring Turnips were particularly barren of useful results.

Various manures were tried on two varieties of Potatoes, viz., Maincrop and Up-to-Date. On sixteen different farms, on ten of which Maincrop was grown, and on six Up-to-Date, on each field a piece was left unmanured; another was manured with twenty loads per acre of farmyard manure; another with ten loads farmyard manure, 4 cwt superphosphate, 1 cwt sulphate of ammonia, and  $1\frac{1}{2}$  cwt of sulphate of potash; and still another plot with 6 cwts superphosphate, 2 cwts sulphate of ammonia, 1 cwt nitrate of soda, and 2 cwts of sulphate of potash. As the results are taken from the average of ten farms in the case of Maincrop, and six in that of Up-to-Date, they may be accepted as being conclusive, not only with regard to the cropping qualities of the two Potatoes, but as to the effect of manure on the crops generally, and the two Potatoes individually.

On the unmanured plots the average produce of Maincrop was  $3\frac{1}{2}$  tons; of Up-to-Date,  $4\frac{1}{2}$  tons. Grown with farmyard manure only, Maincrop produced 6 tons 3 cwt, an increase of 2 tons 13 cwt; but Up-to-Date produced 9 tons 6 cwt, an increase of 4 tons 12 cwt, or nearly double that produced by the unmanured plot.

With ten loads manure, and the smaller quantity of artificials, the results as regards Maincrop were practically identical with those from farmyard manure (twenty loads); and the same were obtained again from the large application of artificials only; but Up-to-Date, though responding well to the influence of the artificials, did not quite equal its own results from the twenty loads of muck alone; the returns from the manure and artificials, and from artificials only, being identical, and in each case half a ton below the all-manure application.

In addition to ascertaining the total cropping results, careful note was also taken of the effect of the manures on the quality of the tubers, but only in connection with the Maincrop variety. The results here are decidedly startling, for it has been an axiom amongst old Potato growers that the influence of artificials was against quality, and there has been great prejudice against their use on that account. We imagine that this idea has grown through observation of the effects of nitrogen used alone, and that other well balanced mixtures have shared in the condemnation.

As a general result of these experiments, it is conclusively proved that 20 tons of farmyard manure produce a very small increase over the quantity produced by 10 tons (both without artificials), the money return being 11s. 7d. per ton for the first 10 tons, and only 3s. 3 $\frac{1}{2}$ d. per ton for the second 10 tons! Not only is this the case, but analyses of the samples proves that the tubers produced by the smaller dressing are of firmer texture and higher quality than the others, and it necessarily follows that the quantity of manure which may be applied profitably to the Potato crop is strictly limited, and that it is not much more than 10 tons per acre.

We have ourselves applied twelve loads per acre systematically for a number of years, previous observation having taught that that quantity was the best mean to stick to. We have proved eight loads to be too little, and though we

were never so extravagant as to use twenty loads, we have seen neighbours do so; but the results never convinced us that twelve loads were not enough. Of course, we used artificials as well, and we fancy that eight loads more manure, with the attendant labour, may very economically have 25s. worth of artificial manure substituted for it, and leave a like sum saved to the banking account.

But we have wandered away from the question of quality. The percentages of starch contained by the various samples were as follows:

No manure: starch, 18.24. Twenty tons farmyard manure alone, 17.38.

Ten tons of farmyard manure alone, 17.92. Ten tons yard manure with artificials, 18.36.

Artificial manures, 18.70.

Here is striking evidence that artificials tend to improve the quality, whilst yard muck has an opposite effect. The more muck is used the lower is the quality of the crop. It is remarkable, also, that on the "no manure" plots the quality is not so good as on the artificial manure plots; although it is considerably better than the yard manure pieces.

There is, however, one point to be borne in mind, and that is, that these satisfactory results were produced by a mixture in which the potash took the form of *commercially pure sulphate of potash*. Separate experiments were carried on to compare the effect of the various forms of potash, and when muriate of potash, kainit, and sulphate of potash were used with other artificials, but against each other, it was found that not only did sulphate of potash produce the best quality of Potatoes, but that it was the most effective form of potash to use in conjunction with farmyard manure.

It is evident from a very brief review of the chief points in this report of the West of Scotland Agricultural College that very good and careful work is being carried on by it; and the results of its labours, especially with regard to the experiments on Potatoes, should be most encouraging to Scottish Potato growers; for they conclusively prove that success does not depend upon an inexhaustible supply of farmyard muck, but that valuable crops may be grown without any at all; and that the increase of the Potato acreage is only limited by the arable land available and the supply of necessary labour. The last item is the real difficulty, for Potatoes employ much labour. In most seasons Great Britain can easily provide her own Potato supply; and by the encouragement of this industry our legislators can do more than in any other way to keep the people on the land.

## Work on the Home Farm.

We are still going through experiences of storm and flood. Some farmers are trying to thresh, and others to lift Potatoes, with ill success in either case. Many Potato fields are being commenced before the Potatoes are fit, because the Irish hands would wait no longer. It was a case of "start work or we go." It is difficult to ascertain the facts as regards the progress of the disease, but there can be no doubt it is very serious. We can vouch for the fact that in at least two instances the epidemic has made rapid progress in the pie, there having been very little to see of it when the Potatoes were lifted. We are giving ours time in the ground, so that the worst may be past before we touch them. We hear of many waggons of Potatoes coming back by rail to the growers, having been refused by the consignees. Growers must necessarily fight shy of risking immediate delivery, under such circumstances, and we advise all sellers to act very cautiously. The safest plan is to deliver to the buyers' order only at the sellers' station.

We hear Evergoods are good and sound, but Empress Queen is not so hardy as might be. We hope to be able to speak with some authority on the new kinds very shortly.

We are sorry to say that stacks are threshing out in very poor condition, and very few of the new samples are at all satisfactory. The driest Wheat fetches 25s. 6d., and some of the damp rubbish can be bought for 21s. Barley makes from 20s. to 24s., but none of it will make malt unless it is previously dried. We have not yet seen a sample of Wheat dry enough for sowing, and seed time is close at hand.

Bad weather and unfavourable corn markets have combined to cause a decided slump in the sheep market. Needy sellers want money, and the needy buyers are hindered from raising any, and there is a deadlock. Our lambs are doing nicely on Turnips, which are firm and good, but we have seen larger roots and heavier crops. The lambs look full and well and very bright in their skins. They are still eating  $\frac{1}{4}$  lb of lamb food per head. It is rather expensive, and we shall gradually reduce it by half and substitute a little Clover in the rack.

## PLANTING SEASON

## PAULS' ROYAL NURSERIES

WALTHAM CROSS, HERTS.

12 miles from London. South Entrance four minutes' walk from Waltham Cross Station; West Entrance three minutes' walk from Theobald's Grove; both Stations on the Great Eastern Railway.

## SPECIALITIES:

**ROSES** in all forms, from open ground and in pots. Gold Medals in 1903 from Royal Horticultural and Royal Botanic Societies.

**FRUIT TREES** for the Orchard, Garden, and Forcing House. Hogg Memorial Medal, 1901.

**HARDY TREES** for Streets, Parks, and General Planting. Silver Medal from Royal Agricultural Society of England.

**SHRUBS**, both Evergreen and Deciduous.

**CLIMBING PLANTS**, Hardy and Greenhouse.

**RHODODENDRONS, CAMELLIAS, & AZALEAS.**

**HERBACEOUS PLANTS** in great variety.

**BULBS and SEEDS**, and all Garden Sundries.

PRICE LISTS ON APPLICATION. INSPECTION INVITED. Upwards of 1000 Medals, Prizes, and other Awards at leading Exhibitions during the past 42 years.

SOLE POSTAL ADDRESS—

## WM. PAUL &amp; SON,

WALTHAM CROSS, HERTS.

Rose Growers by Appointment to His Majesty the King.

## GRAPE VINES in POTS

Extra Strong Fruiting and Planting Canes in all Leading Varieties.

## FIGS IN POTS

All Leading Sorts.

Bushes and Fan-trained for Walls.

## DICKSONS Nurseries CHESTER

## Manures, Their Use and Abuse.

It is becoming more and more recognised that the land, which produces the many comforts and necessities of mankind, and in which is grown the numberless plants and trees that give so bountifully of their beautiful and utilitarian products, is but the storehouse or larder of Nature. Until the gardener, whatever his status, whether amateur or professional, looks this fact in the face, he is still on the same level as the veriest tyro in the art of manuring. One man, usually a clever one, too, in his own estimation, will say, "Give me a proper staple, and anybody can have the artificial manures." Another will so manipulate any sort of medium entrusted to his care, that so long as he gets what he knows to be needful for his crop, they will flourish and yield unfailing supplies, whether the soil in which they are grown was originally good or bad.

At the first glance, the subject of manuring may appear humdrum or commonplace; but those who have studied it in its many phases can but be strongly convinced of its increasing interest and importance. Scientists tell us there is still much to be learned, and while admitting the steady advancement of the past twenty years, they assert that we have gone merely a step or so beyond the experimental stage in the application of fertilising agents.

Very few persons are in a position to rely on unfailing supplies of yard manure, and in many small gardens this is an inconvenient medium for regular use. It is bulky, and frequently unpleasant to work amongst, especially for many people, added to these disadvantages it is not always readily obtainable. Admitting all this, we begin to see that those who advocate the use of so-called artificial manures have a fair amount of reason on their side when they declare them to be cleanly and easy to handle,

READERS are requested to send notices of Gardening Appointments or Notes of Horticultural Interest, intimations of Meetings, Queries, and all Articles for Publication, officially to "THE EDITOR," at 12, MITRE COURT CHAMBERS, FLEET STREET, LONDON, E.C., and to no other person and to no other address.

and when used with discretion, in many localities far less expensive. The novice in manuring, and, it might be added, sometimes those who should know better, are apt to think because a liberal application has been of pronounced benefit in one season, that a double dressing another year will produce a return equivalent in value. This by no means follows, and is the most frequent cause of error and waste. A heavy application of farmyard manure will provide in some soils sufficient nutriment for two or three years' cropping, especially when supplemented by properly blended fertilisers. On the other hand there are thin lands overlying chalk or gravel, into which it is almost impossible to cram too much manure year after year if large and remunerative crops are to be taken from them.

Nitrate of soda and sulphate of ammonia are the two nitrogenous agents chiefly used. If large, succulent Cabbages, tender Cauliflowers, crisp, full-grown stems of Celery or vegetables of a similar character are desired, doses of one or the other of these may be given at intervals of a fortnight at the rate of half-an-ounce to an ounce per square yard, or half-a-pound to a pound per rod. It is not advisable to repeat the dressings too often, two or three times in the course of the growing period usually being found sufficient.

Plants grown in beds or pots, for their flowers, need still greater care if either the nitrate or sulphate is given. If it is desired to have gross coarse leafage with a corresponding paucity of bloom, the plants may have as much as they will bear with impunity. But as this is not, in a general way, the object of cultivators, it is best to adhere to the half-ounce per yard for border plants and half an ounce or less per gallon of water for those growing in pots. Two or three applications in the course of a season will generally suffice in producing that healthy appearance so much admired.

As is now well recognised, the two fertilisers so far mentioned as nothing, or, at least, little more than stimulants, both capable of supplying plants with material of a growth-exciting nature, usually at the expense of solidity and stamina. Having considered this, it is easier to understand how vegetables quickly and highly developed by means of either agent are made tender and unfit to withstand the rigours of wintry weather. The continuous cold and wet we so frequently experience, causes the weak tissues to quickly become a prey to damp and decay, or harsh cutting winds cause the plants to collapse, thus opening up the way for speedy decomposition.

We have here room for the exercise of considerable discretion on the part of the cultivator. There is the possibility of greatly increasing the bulk of a crop, and also of hastening its early maturity by the aid of nitrogenous manures. And for such plants as become marketable in summer and autumn, there can be no doubt as to the wisdom in using them. But when it becomes a question of those which must pass through the winter, taking late Celery or spring Broccoli as examples, there is not only danger from their use in the loss of produce, but also great loss in the waste of valuable material, which would with advantage be applied at a more opportune season.

Mention must now be made of two very different ingredients of manures—phosphates and potash. Without these, in some form or other, no manure is worthy the name. We are often told by writers that nearly all cultivated land contains sufficient potash. Yet, while admitting there may be no lack of truth in such a statement, there can be no doubt as to the benefit derivable from an application—especially to fruit trees that have been some years in bearing—of some form of readily soluble potash. It is not needful here to enter into the merits of sulphate compared with muriate of potash, or both, as against kainit. The latter for many purposes is a cheap and excellent medium, but having seen the advantages derived from the free use of the sulphate when added to bonemeal or superphosphate, I should in nearly all cases advocate its use in preference to the others.

This brings us to the now everyday use of combinations of these manures. When we know what can be, and has been, done by their aid in conjunction with moderate dressings of farmyard manure, it is impossible to avoid contemplating the wastefulness, on the one hand, of cramming land with dung, and, on the other, of allowing it to remain impoverished and unremunerative for lack of proper feeding. There is another cause of waste to which the inexperienced cultivator may easily lay himself open. He finds great benefit to his crops by an application of artificial manure, and is so well satisfied that he determines to double the dose next year. It by no means follows that his subsequent crops will be increased in a like ratio. Indeed, there may be no

increase whatever over the preceding season, and here again we have a reason for proceeding cautiously if we are wisely and economically to make use of the good things that lie to our hands.

In many gardens there are beds and borders containing herbaceous plants or Roses, in view of or in close proximity to the windows of the dwelling. It is not desirable, owing to the offence against more than one sense, to apply heavy dressings of manure of a strong nature to these; and yet, if they become poverty stricken, light dressings of crumbling, thoroughly decomposed material are of little benefit. In such cases I have seen great improvement arise both in the appearance of the plants and the quality of the flowers produced, by the use of a very simple formula. Three parts of superphosphate to one of sulphate of potash, given in spring to Rose beds after pruning (about the same time is suitable for plants in mixed borders and beds), given at the rate of 4ozs or 5ozs to the square yard, with 1oz of nitrate of soda spread over the same area when the plants have fairly commenced growth will frequently assist in a wonderful manner. It is seldom advisable to mix nitrate with the other manures. The dressing may be repeated in the course of a season.

There is nothing complicated about such a mixture as the above, and there is nothing offensive in its application; its efficacy has on many occasions been proved. That there is nothing, or very little, left over from one season to another in the earth is admitted; but the repetition is an easy and certainly not a troublesome or expensive matter. The same cannot be said of carting farmyard manure.

No article of this description can be said to be complete which omits to include lime. So much has been of late written of the part this substance plays in scientific manuring that but little need be added here. We know that it has a most beneficent action upon many soils, especially those of a strong, heavy character. It is also an efficient corrective for those which have been overcrowded with rank food. Though it always seems to me a pitiful waste to so charge land with manure that lime has to be brought into use as medicine.

All who have given this subject of manuring deep consideration will agree that we owe a heavy debt to those who for many years have worked with unwearied zeal in carrying out experiments both in public and private; also for the interesting and informing reports that from time to time have been published in this connection.—PROVINCIAL.

## Symbiotic Bacteria.

It is a well-known fact that nitrogen is essential to plant life. The insectivorous plants, however, can take nitrogen in the form of animal substance, and, by the secretive action of glands, absorb the nitrogenous matter necessary to their requirements. After a series of investigations with soil bacteria, a Russian experimenter, Professor Winogradsky, isolated a little circular shaped body, commonly labelled by bacteriologists Microcei, and he found that this "microbe" was able to convert ammonia into nitrous acid; but further investigations found another little body, a co-worker, that took the resulting nitrous acid, or nitrite stage, and elaborated it into a nitrate, thereby fixing the free nitrogen into the only assimilable condition for the plant.

Professor Nobbe made cultures of the varied symbiotic fungi found on different Leguminosæ, and when he applied the bacteria of one leguminous plant to a seedling of another type, the result showed that the plant did not gain to any appreciable extent; but when supplied with a culture of *its own kind*, the broad result was that the plant made a very fine growth. This would suggest that the plant had no repellant force; yet at the same time the action of those nitrifying organisms would suggest an action of affinity, seeing that one microbial form assists a species of plant, while another has no influence. A belief is current that the plant has an inherent power to facilitate the work of special organisms, and this is more probable than the idea of those bacteria roaming through the soil in search for a Legume. If it can be effectively answered that the plants have some characteristic of their own to attract the microbial member, an additional curious power in vegetation can be chronicled; but if the conditions for their short-lived activity be purely a mechanical one—a question of soil texture—then a broader field for these microbial types can be ensured, and a great power will be placed in the hands of horticulturists. Until these aspects of the problem have been determined in the laboratory, the question of practically applying bacterial cultures to the soil (as by the application of nitrigen) cannot be determined.—A. O'NEILL.

***Cypripedium Lawrencianum Gratrixianum.***

This is a very pretty *Cypripedium*, formal in shape nevertheless. It is comparable to *C. Lawrencianum Hyeatum*, which is coloured green and white; but our present subject has in addition a pale rose tint on the petals and sepals. When shown by T. M. Crook, Esq., of Hoghton, near Preston, before the R.H.S. Orchid Committee on September 16, it received an award of merit. Our figure is from a drawing by Mr. George Shayler.

**The Week's Cultural Notes.**

Propagation of Orchids by the removal of back breaks and potting these on is a recognised method of procedure, but one often gone about in the wrong way. They are usually taken off in spring and potted up at once, disturbing root and branch, so to speak, at the same time. Many plants may be prepared for this disturbance by severing the rhizome now and leaving the several portions to grow alongside the parent plant until spring. Besides propagating purposes, this cutting of the rhizome will induce the formation of back breaks, that serve to make a specimen more equally furnished with growths.

Late autumn is also the best time for this latter operation, the dormant buds plumping up during winter and being ready to start with the rest in spring. If delayed until the latter season, the growths start late in consequence, and are behind all the year. *Laelia superbiens* is a case in point where cutting the rhizome is productive of good results. As imported, this is one of the most difficult species to get into shape, untidy, straggling specimens being the rule; but if back breaks are produced by the above means, and the plants pulled into shape a little at every repotting, this, and the removal of the old and shapeless bulb, will gradually induce a more tidy plant and better habit. There are many other plants that may be improved in appearance by these means; in fact, the great majority of pseudo-bulbous species.

But strong plants only must be chosen; for weak, badly rooted specimens may be seriously injured by the cutting. Nor should rare or valuable specimens be operated upon until some experience has been gained with cheaper and commoner sorts. In the case of small growing *Cattleyas*, or *Laelias*, *Odontoglossums*, and dwarf species generally, it is advisable to notch the rhizome rather deeply at first, to check the flow of sap, but to leave the actual severance until roots are forming on the part to be severed.

Naturally, after the disturbance and check to the plant following this cutting, a careful régime is necessary. Both the parent plant and the offshoot must be kept rather warmer and closer, not exposed to draughts or cold air while in their convalescent state. As the roots obtain a fresh hold, they may gradually be returned to the ordinary growing quarters and treated similarly to established plants. Before commencing any of these operations it is necessary, of course, to consider whether or not the value of the plant will be enhanced by them. They must not be rushed into just for the sake of experimenting, and it should be kept in mind that a fine, healthy specimen of a good form is always worth more than a number of scraggy pieces.—H. R. R.

**Oak Leaves from Mountain Ledges.**

It may be news to many folks when we say that a Journal reader carries on a business amongst the Welsh mountains, his work consisting in gathering pure Oak leaves from the ledges of rock in the mountain woods, overlooking the sea at Trawsfynydd, R.S.O., Merionethshire. Our friend is Alfred Johnson, F.R.H.S. (Bala Sphagnum Supply), who employs quite a number of men at this season.

***Phalænopsis amabilis Rimestadiana.***

The genus *Phalænopsis* is unquestionably among the finest Orchids yet introduced, and although nearly all varieties are beautiful, the subject of our notes is considered decidedly the best. The subject, *Phalænopsis amabilis Rimestadiana*, was imported from Java, where it was found growing at a higher elevation than any other species of *Phalænopsis*, consequently it can be successfully grown in the *Cattleya* house, as it does not require the heat of other varieties. Its free growing habit and the freedom with which it produces its large flowers make it quite an acquisition to our Orchid houses. This variety has been quite extensively distributed throughout England and the continent of Europe during the past year. It is easily distinguished from the Bornean variety by its light green foliage and dark green flower spike, whereas in the Bornean variety the stem is yellow. The plant (says the "American Florist") has just flowered in the collection of Dr. R. Schiffmann, St. Paul, Minn., U.S.A.

**Storing Pollen.**

In the crossing and hybridising of Orchids, Daffodils, or other flowering plants, the hybridist has many times intended to make certain thought-out crosses, but waits to find that the pollen and the stigma of two chosen agents are far removed in the date of their necessary adaptability. What has he (or she) to do? In the case of Daffodils, the pollen has often to be kept for two or three weeks, and it still remains vital. We learn from the "Orchid Review" (October number) that the pollen-masses in the flowers of *Cattleyas* and some other genera of Orchids can also be excised and stored for quite extended periods without losing their fertilising power. We may be allowed to quote what Emily Thwaites says on pages 292 and 293 of the "Review." In opening, she writes:—"I tried various means, and the one I

have found most successful seems too simple to write about. It is to remove the pollen carefully from the flower; wrap in the blue tissue paper florists use; write name and date on, and put in a tin box." She then names certain species whose pollinia were tried.

Continuing:—"I might say, too, that in raising the plants true from seed, it is not wise to use a flower's own pollen, but rather to get it from another plant of the same variety. For instance, last November I fertilised two flowers of *Cattleya labiata Amesiana*, one with its own pollen, and one with *labiata R.I. Measures* variety. The former stayed on six months only, and on being sown proved all chaff; the other has gone on all right. Then *Cattleya Trianae alba*, self-fertilised, burst at six months, and we fear there is little chance of the seed being good, while *Cattleya Mossiae Wageri* fertilised with its own pollen, though hanging throughout the year, was very bad seed, and we only got a few seedlings.

At the same time I ought to say that *Dendrobium nobile virginale*, self-fertilised, resulted in a good pod of seed, and we got a good many seedlings up.

"Of all the pollen we have used, too, taking it all round, I think that that of *Brassavola Digbyana* has proved the most vigorous. It gives splendid results; even when put on *Cattleya Dowiana aurea* we got a fine pod of seed, and aureas as a rule are very bad seed parents."

***C. Lawrencianum Gratrixianum.***

### Hints to Exhibitors.

(Concluded from p. 352.)

Having written at some length on the errors committed by exhibitors in selecting their blooms, and their methods of procedure, a hint or two on staging may be useful to those who are about to enter the exhibition arena for the first time. Even to some exhibitors who have spent many years in the show tents, a little knowledge would be beneficial if they would only open their eyes to personal faults. Fortunately, that crude method of staging Japanese blooms upon the orthodox stand is fast becoming obsolete; in fact, if executives generally could adopt the "vase" method of staging the Japanese section entirely, a better effect would be produced. The full value of this type of Chrysanthemum would be displayed in its true character, and visitors would have less cause to complain than at present.

I am quite aware that such a drastic change as this suggested means much more to many societies than the mere idea of change. The procuring of suitable vases means much expense to a society that can at the present moment only just present a clean balance-sheet. Exhibitors cannot, of course, be expected to provide their own vases. The difficulty, too, of transit of blooms on long stems is increased over that where the orthodox stand only is employed. In arranging the blooms in either vases or stands, the great point is to avoid overcrowding; arrange every bloom in such a manner that all its points of excellence are displayed fully. When arranging in stands by the aid of cups and tubes, an even stand should be the aim of an exhibitor in size, colour, arrangement, and freshness. Some exhibitors place two large blooms side by side because the colour harmonises better; but this latter point does not receive the same consideration from judges as some imagine it ought. Of course, where two competing stands are close in point of merit, then harmony of colour scores a point.

In the ordinary "vase" classes, seldom are mixed varieties placed in the same vase. Generally three or five blooms of one sort are required, and for producing a pleasing effect this arrangement has much to recommend it. Some cut the stems too long, which renders the blooms somewhat gaunt in appearance, especially if they be below medium size; others err in the opposite direction by giving the blooms a "dumpy" appearance, particularly when they are large examples. The point is to display the blooms with just sufficient foliage to give effect to the blooms, and by all means so arrange the stems that the petals of one bloom in the same vase do not overlap those of its neighbour—a too common fault, even by the leading exhibitors.

*Naming the blooms is very important to all concerned.* Exhibitors, in the interest of nurserymen, should be particular in this, as it saves much annoyance to the cultivator next season, and a loss of trade to the vendor also. Visitors to the autumn shows see and admire certain kinds; they order them from some specialist, who supplies the sorts ordered, and, when they bloom the following season, are found different to those seen at the show in question, because the exhibitor had them improperly named.

Instances of wrong naming cannot disqualify an exhibitor, but they prove very annoying to those whose experience is not superior in judgment or knowledge. The manner in which the blooms are named at many shows needs strong condemnation, for so badly are the names spelt and written, that it is with difficulty they can be read at all. In the crush that often prevails at shows, this is anything but pleasant for the visitor. Exhibitors should bear in mind that they, important as they are, are not the only persons the society has to cater for.

Another point I would draw attention to is the all too common plan that some exhibitors—disappointed ones generally—have of standing in front of an exhibit, arguing points of quality (in none too low a tone at times), to the discomfort of visitors, and not with credit to themselves. I quite forgot to say that the best system of naming is that of small printed cards, firmly placed in front of each bloom or vase. In the case of naming in stands, the three names should be placed in front of each row of three blooms in the order of arrangement. A cheap yet efficient method of naming is that of writing the names clearly on an ordinary envelope, the flap being used for sticking it to the board in front of the blooms. The worst plan of naming is that of writing all the names closely together on a half sheet of note paper, laying it in front of the stand to be pushed on to the floor by the first crush of visitors.

One more suggestion to the exhibitor, then I must close:

avoid being late in staging. Not only does this limit the opportunity of the exhibitor to put the finishing touches to his blooms, but it is a source of serious importance to judges to be prevented commencing their labours in reasonable time, and to the officials also in presenting the room in a tidy appearance to the visitors. If judges do make some slight mistakes owing to a lack of time to examine sufficiently the exhibits, how, then, can they be blamed in consequence?—E. MOLYNEUX, V.M.H.

### Feeding.

The plants will receive great benefit from judicious feeding. When the pots are full of roots it is essential to afford some help in addition to the supplies of water. Clear soot water may be given frequently, alternating this stimulant with others made from sheep, cow, and horse manure. A peck of either of the above may be placed in a bag and sunk in about twenty-five gallons of water in a tub. Soot water is made clear by mixing in a shovelful of lime with the above quantity, and allow to stand until clear. The concentrated artificial manures are excellent, and ought to be used according to the vendor's directions supplied with each tin or bag. Their too frequent use is not to be recommended, nor are the special or nitrogenous manures, such as nitrate of soda and sulphate of ammonia, to be used indiscriminately. The systematic applications of all stimulants should cease when the blooms have well developed, giving the plants only clear water. Should the soil at any time become drier than usual, clear water only ought to be used to moisten it, following afterwards with any manurial applications.—E. D. S.

### Early Chrysanthemums on Tayside.

Although not possessing the massive appearance of the exhibition Japanese varieties, which rejoice the heart of the enthusiastic competitor, there is a grace and neatness about the early flowering Chrysanthemums which commends them to the ordinary admirer of these now indispensable flowers. This was forcibly brought home to me a few days ago when visiting the beautiful gardens of Sir Robert Pullar, at Tayside, Perth. There I saw in the conservatory a number of plants growing in pots 5½ in in diameter, neat little specimens, 15 in to 18 in in height, well furnished with foliage down to the pot, and each carrying ten beautiful blooms averaging five or six inches in diameter. Plants of this description are much more useful for decorative work than the long, leggy specimens grown to produce exhibition blooms. The varieties grown at Tayside are principally Mytchett White and Goacher's Crimson, both of which seemed particularly amenable to this style of culture, forming perfect little specimens. Asking Mr. McDonald as to the treatment given, his reply was brief and to the point, viz., secure good cuttings, root in the usual way, pinch when three inches high, and again after the plants have made another three inches of growth, then secure the first bud, and do not feed heavily.

Growing in the open, we observed these two varieties doing remarkably well. Our experience of Mytchett White led us to conclude that it was an exceedingly shy grower; but at Tayside it gives no trouble, being quite robust in growth and very floriferous. Parisiana, growing side by side with it, was not nearly so fine, despite the high recommendations with which it was sent out. Another very fine variety we noticed is Craignillar, a yellow pompon, superior in every way to Flora or Précocité. This is a decided acquisition, and well worthy of a place amongst early flowering sorts.—ALBYN.

### Official Catalogue of the N.C.S.

A supplement to the National Chrysanthemum Society's Jubilee Edition has been issued, bringing up matters connected with the Chrysanthemum to 1903. To those who do not possess or know anything about the N.C.S. Catalogue, we would mention that there is an alphabetical list of Chrysanthemums raised or sent out since the spring of 1896, with their sections indicated and their colours described. There are also selected lists of every section, apart from the complete list. It is published at 1s. Apply to R. Dean, Ranelagh Road, Ealing.

BATTERSEA PARK annual exhibition of Chrysanthemums opened last week. The Chrysanthemum House, near the Albert Bridge entrance to the park, contains thousands of magnificent blossoms.

A GREAT CALIFORNIAN SEED FARM.—The "Scientific American" supplement, No. 1,443, August 29, gives a fine illustrated account of the seed farms of C. C. Morse and Company, Santa Clara, Cal.

THE WORLD'S FAIR AT ST. LOUIS.—The propagating department at the World's Fair grounds is a busy place just now. Two hundred thousand plants are already on hand, with thirty men making cuttings. It is estimated that four million plants will be used in the landscape department. About one million Pansies and Bellis will be used in the early spring. The range of hot-beds is being piped for steam heating.

#### **Hedysarum multijugum.**

*Hedysarum multijugum* is one of our prettiest of hardy flowering shrubs. It was introduced from China about 1880, is perfectly hardy, and blooms in June. The flowers are borne in clusters, and are of a very bright carmine red. They are borne well above the foliage, and can therefore be seen a long way off. The bushes are round and dense, and the branches, as well as the under side of the foliage, white with silvery grey hair.

#### **Pentas carnea.**

One of the plants which should be revived is *Pentas carnea*, according to "Die Gartenwelt." It belongs to the Rubiaceæ, and comes from tropical Africa. It is a free bloomer. Not in the summer only in a cool house or sheltered spot in the garden does it develop its magnificent, rosy lilac, upright clusters of flowers, but in the fall and winter also it is perpetually in bloom. It is easily raised from seeds or cuttings, and thrives best in a rich, sandy soil.

#### **The New Potato, Sutton's Discovery.**

We have received the following letters:—

"Notwithstanding such a bad season, I cannot speak too highly of 'Discovery' Potato. In the 11b, we had eleven Potatoes which we cut up into sets of one eye each. We have now lifted 74lb of good sound tubers. With us this is a splendid crop for such a terrible year."—Mr. G. CARPENTER, The Gardens, West Hall, Byfleet.

"I have this week dug the produce of 11b of seed of the new Potato, 'Discovery.' The result is exactly 50lb, and not one diseased tuber, although they have been perfectly saturated with wet the whole season, and with heavy soil combined. I think this is a pretty fair test, and I have not subjected them to any artificial treatment. The eating qualities I consider excellent, and wish I had my whole Potato breaks planted with the same this disastrous season."—Mr. G. R. GEORGE, The Gardens, Wavendon House, Woburn.

#### **Aster, Coombe-Fishacre White.**

The many who appreciate the valuable Starwort (perennial Aster) called Coombe-Fishacre, which makes a pretty bush in the garden with its multitude of flowers, will do well to secure the white one named Coombe-Fishacre White. Like the other it was raised by Mr. T. H. Archer-Hind, of Coombe-Fishacre House, Newton Abbot. It may be said to be a white counterpart of the original one, and it makes a capital companion to it. Mr. Archer-Hind is still raising new Starworts, and a box of flowers of his new seedlings, as yet unnamed, reached me the other day. It was difficult to select from so many beautiful ones, but I endeavoured to do so, to my own satisfaction at least, and I hope to see some of them in my garden next year. It is as well to remark that Mr. Archer-Hind, like the writer, does not sell plants.—S. ARNOTT.

#### **Hibiscus syriacus.**

A good sized specimen of this beautiful autumn flowering shrub flowered profusely here last season. I do not think this is a very common plant in the North of England, but is grown more in the South, where it is warmer. It is quite hardy, having withstood most severe winters without protection; but the wood must be well ripened, or it will not bloom very well. This shrub has a very nice habit, the branches growing upright, giving it a compact outline; the leaves, which are wedge shaped, are three lobed and toothed. Ours is the single blue variety, with claret coloured strips, catalogued under the name of *Cœleste*. There are many forms of it in cultivation, some with double flowers, and in a variety of colours. Its flowering time is August and September. A well drained and rather light soil is best, and it should have a sunny position, so that the wood may get well ripened. It is sometimes found under the name *Althæa frutex*.—J. S. UPEX, Yorks.

#### **"The Pierson Fern."**

Much has been written in praise of this exceedingly handsome Fern—*Nephrolepis Piersoni*. It is an American variety (or species?), and has come to this country through Mr. H. B. May, of Edmonton, London. He staged well grown, nicely crested plants at a recent meeting. From seeing those plants, we can thoroughly recommend this as a valuable addition to decorative Ferns, and for ornamental uses. It received "the first and only gold medal ever given by the American Society of Florists to any plant."

#### **Culinary Pea, Alderman.**

Out of a very large number of varieties grown this season, this has proved itself indispensable in every way. Its heavy cropping qualities, coupled with the extra large pods filled with peas of the most delicious flavour, being eminently suitable to all who have a large demand made upon their resources. Growing to a height of 5ft it may not be suitable for those who are short of space and sticks; but where at all possible it is worth an effort to try it. As an exhibition variety I consider it of the finest, possessing the highest points of colour, size, and flavour.—R.

#### **Fansies.**

The colours exhibited by Pansies are most extraordinary. Some are as near black as flowers can be. The richest purples are common, with clear yellow, intense violets, lavenders, tender dove colours, rich maroons and browns. On the lower petal, which in the Violets is hollowed behind into a nectar-bearing spur, there can be usually seen, when the ground tint is not too dark to obscure them, the so-called "guiding lines" to which Sprengel first called attention. He claimed for them a significance which science has of late reaffirmed, maintaining that they serve as so many clues or lines of direction to assist insects in finding the nectar.—("American Botanist.")

#### **Potato, The Crofter.**

This fine white, round maincrop Potato was sent out by Messrs. Dobbie, of Rothesay, in 1898, and it is singular that it has not been much more heard of in the neighbourhood of Lancashire and Cheshire. I have no hesitation in writing this note after seeing many varieties lifted and cooked on the same day, the "Crofter" turning up with tubers beautifully white, extremely heavy, and an absence of small ones. On its being cooked one could not have wished for a finer sample, floury, and with a flavour such as we used to get in some of the older varieties. The flesh is firm, and skin slightly netted, shallow in the eye, and of much value in an exhibition collection.—R. P. R.

#### **Experimental Potato Growing.**

For many years the esteemed editor of the "Ormskirk Advertiser," Mr. W. L. Hutton, has offered valuable prizes at the Liverpool Grain, Root, and Fruit Show, for the newest varieties of Potatoes. These he undertakes to have planted the following season with a view to their being tested for market purposes. The land on which they are planted is of a strong nature, situated at Aughton, near Ormskirk, and is a good Potato growing district. Mr. Henry Jenkinson, of Bold Lane, Aughton, has had the stock under his charge this season, and every facility for intelligent cultivation has been afforded.

In such a season as the present, the growth has been abundant; but owing to the very wet weather disease has been unusually prevalent. The lifting of the crop has been most carefully done, and the weighing thoroughly carried out with the following results:—

Name.	Weight of seed in lbs.	Weight produced.		
		Sound.	Small.	Diseased.
Early May .. ..	2	11	2	8
New Majestic .. ..	3½	28	1	16
Edward VII. .. ..	2½	26	2	14
Fylde Wonder .. ..	3	41	2½	13
Coronation Kidney .. ..	2½	28	1	17
Maddock's Excelsior .. ..	2½	30	2	7
Enterprise .. ..	3	38	3	12
Carlottians .. ..	2½	21	2	6
Niven's Table Talk .. ..	3½	51	1	26
General Buller .. ..	2½	17	2	9
Seedling (unnamed) .. ..	2½	29	2	5
	30	332	23½	129

"Table Talk" proved itself a good cropper, excellent in shape, and of fine quality.—R. P. R.

## County Council Instruction in Horticulture.

Continuing the series begun in April of this year, the present notes briefly summarise the work being undertaken by the Oxfordshire County Council, whose horticultural instructor is Mr. Samuel Heaton. By abridging the annual report of the Technical Instruction Committee for the year 1902-3, as presented to the Oxfordshire County Council, a fair outline of the work will be gleaned. The report is as follows:—

### Oxfordshire.

#### "Horticultural Lectures, Trial Allotments, &c.

"In the past year, 200 lectures have been delivered by Mr. S. Heaton, the staff instructor, attended by 3,435 auditors. These included single lectures, short courses, and three long courses of lectures and demonstrations in preparation for the Royal Horticultural Society's examination. These latter were held at Adderbury, Bicester, and Chipping Norton. Although the attendance at the lectures was good, few students (only eight in all) sat for the examination on April 22. The results of the examination are satisfactory; all eight candidates passed.

Mr. S. Heaton.

"Thirty-four demonstrations have been given in gardens, allotments, &c., attended by 347 persons. Growing interest is being exhibited by allotment holders and cottage gardeners in the work of the staff instructor, and information is constantly asked for by them as to the cultivation of their crops, the destruction of insect and fungoid pests, and the eradication of weeds, so that the visits to 190 allotments and 118 gardens have proved of considerable value. Reports of the trial allotments, leaflets on insect pests, diseases, manures and manuring, &c., have been widely distributed among the cottagers. During the year, also, 255 allotments have been judged, and eleven shows have been visited by the staff instructor as judge. A short course of Nature-Study excursions for teachers has been planned, and a party of some twenty to twenty-four teachers went with the instructor to the gardens and woods of Heythrop, Blenheim, and Middleton Stoney. Full reports of the work of each of the nine trial allotments in the county were printed and widely circulated.

"The annual exhibition of the produce grown on these trial allotments was held on September 18, 1902, in St. John's College, Oxford, when Mr. W. Hovell acted as judge. Throughout the summer the plots had been inspected several times, for the special purpose of awarding marks for (a) general cleanliness, (b) system of cropping, (c) methods of cultivation, (d) respective merits of crops, and (e) the financial position of the individual plots. . . . Demonstrations in grafting and budding have been given on most of these centres, and considerable interest has been taken in the operations by the cottage and allotment gardeners of the neighbourhood.

#### "PRACTICE PLOTS.

"The 'Practice Plot' scheme, whereby any allotment holder may receive advice as to his methods of cultivation, makes slow progress. Those working under the scheme are well satisfied, and much good work has been done, but the allotment holders are diffident of writing reports. The following report, however,

will show that the advice given is appreciated: 'I beg to inform you that the yield (of Wheat) was very satisfactory. When threshed the amount was seven bushels of corn (grown on one chain and a quarter of allotment ground)—a very good sample, too, as the flour makes good, sound, and sweet bread. I may add that my yield of Wheat was the best in the allotments this year (1902). (Signed). GEORGE BERRY, North Newington.'

The Committee's report gives a tabular statement to show the work of the staff instructor during the year, but we must be content with the gross summary: "Number of lectures given, 200; total attendances, 3,435; number of demonstrations given, 34; total attendances, 347; visits to trial allotments, 69; gardens visited, 118; allotments visited, 190; gardens and allotments judged, 255; shows judged, 11."

After glancing through the foregoing report, it will be patent to everybody that Mr. Heaton is well and busily occupied; and for the guidance of the allotment holders and amateurs he has had prepared a "Calendar of Garden Operations" in leaflet form.

### Mr. S. Heaton.

It is just over forty years since Mr. Heaton was born at Keighley, in Yorkshire, to wit, August 6, 1863. He entered the establishment of the late Sir Isaac Holden, Bart., at Oakworth House, in the year 1878, at fifteen years of age. This place was then in the making, and here experience was gained in land draining, reservoir making, rockery building, and landscape gardening. Hard practical work was the order of the day; and through the kindness of the architect, the late Mr. George Smith, books on landscape gardening, surveying, and allied subjects were studied.

Over seven years were spent here in acquiring practical knowledge in the cultivation of fruits, flowers, vegetables, and plants, under Mr. Halliwell Shaw, a thoroughly practical gardener, whose motto and practice was WORK. He was, indeed, a good teacher.

The glass department was very extensive, as will be seen from the following extract, which is from the "Bradford Weekly Telegraph" of Saturday, March 31, 1883: "It is the winter garden that constitutes the special and particular charm, and when it is remembered that the bare formation cost about £30,000, some idea may be obtained of its noble proportions. In addition to this large 'garden,' whose interior embraces an area of about half an acre, there are also enormous ranges of glass houses, forty in all, covering an area of about two acres, and requiring a series of over a dozen boilers and tens of thousands of feet of hot-water piping to keep them at the required temperature. Opening immediately from the end of the winter garden is a lantern-roofed house devoted to Muscat Grapes, and connected with this are six other vineries arranged so as to give continuous croppings all the year round.

"Right and left of the winter gardens are Orchid houses and greenhouses. There is a good collection of rare and valuable Orchids, and the Rose house, Camellia, Azalea and Heath houses, &c., contain many handsome and well grown specimens. The fine Peach, Melon, and Cucumber houses are well stocked. The vineries contain 4,000 feet of four-inch pipes; the fine pits and plant preparing houses, &c., 7,000 feet; the stoves adjoining the winter garden, 11,000 feet; the winter garden itself, 7,500 feet."

While at Oakworth House, opportunity was taken of the science and art classes, both at Oakworth and Keighley Mechanics' Institutes, to acquire instruction in drawing (geometry, freehand, &c.), botany, agriculture, and mathematics, which Mr. Heaton must have since found very useful.

In 1886 a move was made to Astley Bank Gardens, Darwen, under a Mr. Charles Grey, an excellent vegetable and fruit grower. From here, Dileworth House Gardens, Longridge, was taken charge of, followed by Claye House Gardens, Halifax, and Elmwood House Gardens, Batley. During these appointments exhibiting was tried, and successfully.

In 1891 a move was made to Leeds, to take charge of the Yorkshire School of Horticulture in the theory and practice of gardening; and in 1893 our friend was appointed horticultural instructor for the Isle of Wight County Council, but resigned that post in January, 1901, when he commenced duties under the Oxfordshire County Council as Rural Agricultural Instructor. Thus the record of a strenuous worker, a man as eager to get as to impart knowledge; and both in his teachings and his studies he goes systematically to work. Mr. Heaton is not merely a theorist and science scholar; he is practical above all, and unless that is a qualification of a C.C. instructor, his own time and that of others is largely wasted.

When superintending practical work in the open-air, as, for example, trenching, pruning, making alleys, or planting on allotments, Mr. Heaton cannot tolerate the deliberate, half-willing worker; he will somewhat sharply ask to have the spade (or other tool), and with vim and skill proceeds to "ocularly demonstrate" how the business *ought* to be undertaken. And that is just what the majority of the country working-men want; they do enjoy "elbow-grease," especially when it comes from the man who is set over them to give light and leading.

We give a synopsis of his session's work at the Batley Technical

School, the table being drawn up for the prospectus in the following manner:—

Date and Time.	Teacher.	Fees.
Thursdays, 7 p.m. to 9.30. Commencing Sept. 15, 1892.	MR. S. HEATON. Late Gardener to Lieut.-Col. Sheard.	3/- per Term. 5/- per Session.
Classification of Plants The Organs of Plants Soils:—Their Composition, &c. Organic Manures Inorganic Manures Germination of Seed Propagation of Plants Fertilisation Cropping Land Window Gardening Garden Implements and Utensils	Judging Fruit, Flowers, &c. Ferns: their culture, &c. Orchids: " Vegetables: " Stove Plants: " Hardy Fruits: " Forced Fruits: " Bulbs and tubers: " Foliage Plants: " Flowering Plants: " Climbing Plants: " Heating Apparatus	Wood, and its effects on the prolificness of plants Horticultural Buildings, &c. Floral Decorations School Gardening Cottage Gardening Roots, and their uses Chemistry & Cultivation of Plants Elementary Landscape Gardening

As judging forms a part of the instructor's business, and, moreover, as point-judging is so generally being practised, Mr. Heaton has produced what is named Heaton's Horticultural Register, which we presume is sold by himself. The book is arranged with ruled spaces for Division, Class, Points, &c., and "particulars" can be written on the back of each slip. The points can be given for each of four prizewinners, and a slip can be torn out for the secretary's use.

## Insects as Garden Adornments.

There cannot be any doubt, I think, that one result of the wet summer of 1903 has been a great reduction in the number of caterpillars. It might be a question which kind suffered the more from the excessive moisture and the frequent winds, the caterpillars feeding on trees and shrubs or those living near the surface of the soil. Forced from their hold on

branches or twigs by rough weather, those feeding exposed have often had difficulty in getting back to their food, while the less elevated species have had such a drenching as proved fatal by enfeebling them, or they were so exposed that insect-eating birds devoured them. Then, before they had time to deposit eggs in the spring, early moths of the Noctua tribe were cut off by the keen winds, and many broods, usually seen, did not put in an appearance. Some caterpillars, however, that could brave the ungenial weather, got on well, owing to the abundance of green food. Still, the scarcity of numerous species that occur in gardens, orchards and shrubberies was remarkable: probably it will lead to a diminution next year too.

We have still to look at some beautiful moths belonging to the Noctua tribe, that have not yet been noticed in our present series, but ought not to be passed by. Nearly all the caterpillars of this tribe have smooth skins, often velvety, the exception being the genus *Acronycta*, already referred to, where most of the caterpillars are very hairy. The fact that many of those caterpillars are hairy which live from autumn to spring suggests that hair or down furnishes some protection from rough and damp weather. Some of the Noctua caterpillars hibernate, either hiding in low herbage or, more frequently, going underground, probably suffering no ill effects from ordinary rain. Others feed on vegetables till autumn is well advanced; these are apt to escape observation by suddenly dropping, rolled into a ring.

The caterpillar of the Angle-shades Moth (*Phlogophora meticulosa*) sometimes does this; more often it simply doubles itself if alarmed. It is a rather leech-like caterpillar, the head and near segments being small, the body green or olive brown, with numerous white dots and three lines. There are two broods. One in April and May resorts to Primroses, young Chrysanthemums, and various live plants; the autumn brood is found on Hollyhocks, Dahlias, Nasturtiums, or plants that are handy. The moth is out about June, then again at the end of September. If not brightly coloured, it is decidedly a handsome insect; the dark brown wings are

Conservatory at Smedley's Hydropathic, Matlock. (See page 376.)

Richardson & Co.

touched with green and grey, and crossed by angled markings. It is abundant throughout our islands.

A less, rather similar species is called the Small Angle-shades (*Euplexia lucipora*). This is a June moth of deeper colours, having two conspicuous white spots. We find, later in the year, the green, dark-lined caterpillar feeding upon the Brake Fern or on Nettles.

To the species which books now call the Green Brindled Crescent, or *Miselia oxyacantha*, the old entomologists gave the name of "Glory of Ealing"—evidently the moth was first noticed near what was a pretty village a century ago. Since then the moth has turned up in many places, and appears in gardens during September, because the caterpillar usually feeds in early summer upon the Hawthorn. This is rather dull-looking, grey brown, having a few white dots. The moth has a ground colour of reddish brown, which is marbled, and upon it are scales of metallic green. Its eyes are very phosphorescent, or electric, when it has just emerged from the chrysalis and is exploring the evening flowers.

Another showy September moth, chiefly seen in South England, and a not unusual Cockney species, is the large *Ranunculus* Moth (*Polia flavocincta*). I cannot account for its English name, unless, indeed, it has been taken as caterpillar upon some species of *Ranunculus*. But this, which is pale green, having white stripes and dots, occurs mostly upon Chickweed and Groundsel in the spring; also it has been taken off garden Mints. The general colour of the moth is smoky grey; upon this are darker marblings. Its special beauty is a row of orange spots on each wing, containing black arrowheads, which point towards the base of the wings.

When other flowers are getting few the Ivy bloom attracts the autumn moths, and amongst these, hovering on walls or banks, may be seen the species oddly called the Marvel-du-jour, or *Miselia opulina*, the latter, by-the-bye, suggesting that it is also a spring insect at times. Certainly, it is a handsome moth, the pale green forewings exhibiting markings of black and white, which occasionally run into a band. The head and thorax are also light-coloured, but the hind wings are dark. By searching Oaks, its caterpillar has been taken about June: it is greenish grey, reddish on the back, the head displays in front a funny black mark X-shaped.

We might say that the bulk of these Noctuas hide by day amidst the herbage, in shrubs, or they rest upon the branches of trees, but some prefer palings, where they sit quietly and usually allow us to inspect them without stirring from their position.

Palings or low walls in June and July exhibit the Grey Archer (*Aplecta nebulura*), a fair-sized moth, varying in colour from whitish to dark grey, marbled and mottled, showing usually two distinct spots. Its brown, rather stout, and velvety caterpillar lives on low plants during autumn, and after its winter sleep mounts Sallow, Whitethorn, or Birch, devouring the young leaves.

Less common and more beautiful is the Silvery Archer (*A. tincta*), which has been taken in gardens near London: the forewings are pearly and somewhat silvery; upon the ground is a band of brown and sundry streaks, the body is crested. Entomologists hunt for the caterpillar on Birch trees during autumn. It has a small head, and is pale brown sprinkled with black and white dots. There is also a Green Archer Moth, grey green, black and white; but the grandest species of the genus is the Great Brocade, or *A. occulta*, which turns up occasionally all over England, and which is dark brown or almost black, with a grey pattern, which probably suggested the English name. Its caterpillar has been taken off Primroses in spring, or on kindred plants, but is not easily found, since it hides during the day.

Sometimes the caterpillar of a species is much handsomer than the mature insect, and this is the case with the Sword-grass (*Calocampa exoleta*). The moth frequently visits the Ivy in September or October, and in spring it appears upon the Sallows. It is a fine moth, though it only exhibits dull grey or brown colours, but the caterpillar is very conspicuous, and must, one thinks, often be seized by birds. It reposes, after eating, in full view upon the stem of some Sedge, a Scabious, or the Bladder Campion. The general colour is green. On each side are four stripes: two are white and narrow, two broader are yellow and brilliant red; it is also sprinkled with dots of black and red.

Again, we have a family of moths that are called "Sharks," of moderate size, and harmless enough. I can only conjecture the name was given because the caterpillars sometimes appear in companies; but I do not think they are unusually ravenous. Amongst the species there are some

with showy caterpillars, the moths being dull in colour. The common "Shark" (*Cuculis umbratica*) sits upon palings in June, often escaping notice. Its caterpillar feeds at night, hiding by day on or near the earth. Lettuces and Sow-thistles are its food; in colour it is deep brown, delicately shagreened with grey, and having orange spots on some of the segments. Some seasons this caterpillar has been rather damaging to garden Lettuces, but lately it has occurred less plentifully. Then the Aster Shark (*C. Asteris*) has a pretty caterpillar; it is olive-green, and striped with blue, yellow, and white. It is found during the autumn on China Asters, also on the Golden Rod in woods.

We must not linger amongst these moths, and will content ourselves with the mention of two more, the Herald Moth—regarded as a pioneer of spring, which hibernates frequently in garden sheds and toolhouses, and occasionally in stables. It is grey, brown and orange in colour. The other is the Hebrew Character, another early species, exhibiting a curious design on the wings. Its body has long scales. Many more handsome species may be found in the list, as "Rustics," "Gothics," "Brocades," and their kindred.—ENTOMOLOGIST.

## Hardy Shrubs for Forcing.

If not already done, those shrubs intended for forcing during the coming season should at once be picked out, lifted, and potted up in some good loam without delay. This done, plunge them in ashes outside, to protect the pots from frosts, until they are required. Those plants that have remained in pots since they were forced last season, should have some of the old soil picked off, and receive a top-dressing of loam and cow dung.

In hardy shrub forcing a great mistake is often made by introducing the plants into too high a temperature for a start; the result is, either the flower buds go blind, or if they come to maturity are very unsatisfactory. Take the plants inside in good time, and allow them to come on gently in a day temperature of 50deg to 55deg; syringe them daily to assist them in starting into growth. Raise the temperature as soon as they are nicely started, to 60deg to 65deg, and later—if occasion demands it—to 70deg by day. As soon as the first blooms are observed to expand, remove the plants out of the high temperature, and gradually inure them to that prevailing in the conservatory or house in which it is intended to arrange them.

One of the most popular plants for forcing is the *Azalea mollis*. Though comparatively useless as cut blooms they are in great demand for the conservatory, which place their glowing tints brighten up considerably. The yellow variety, Anthony Koster, is generally admitted to be finest *Azalea mollis*; while *occidentalis* and *Daviesi* run very close for second honours.

Closely allied to the *Azaleas* are *Rhododendrons* [*Azaleas* are now botanically classed as *Rhododendrons*.—Ed.]. Although when in bloom they do not present such a profuse mass of flower as do the *Azaleas*, the *Rhododendrons* are of greater utility for cut bloom, which is an important factor in most establishments. To attempt to pick out the best varieties is a rather difficult matter, as tastes vary so, and the range of colour embraced is so wide. A few tried and reliable sorts for forcing may be enumerated instead: *Cynthia* (rose colour), *Purity*, *John Waterer* (carmine), *Lord Derby* (dark; spotted), *Mrs. John Waterer* (bright crimson), and *Mrs. T. Agnew* (white).

With *Lilacs*, some experience a difficulty in successfully bringing the plants into bloom. Immature wood is sometimes the cause of this; but very often the cause can be ascribed to introducing the plants into too high a temperature at the commencement. *Marie Legrange*, *Charles X.*, *Souvenir de L. Späth*—a magnificent variety—and *alba grandiflora* are among the best for forcing. The *Guelder Rose* (*Viburnum Opulus* and *V. plicatum*) are worthy of a place in the forcing house. Their large, snow white trusses are both showy and useful.

Other shrubs suitable for forcing are *Laburnum*, *Staphylea colchica*, *Weigela rosea* and *W. amabilis*, *Wistaria sinensis*, *Deutzia gracilis* and *D. candidissima*, *Prunus sinensis*, and *Spiræa Thunbergi*, *S. Bumalda*, and *S. Reevesiana*. A few plants of *Acer Negundo variegata*, and *A. aurea* should, if space permits, be also included; their bright and picturesque foliage is very attractive.—G. R., Waddesdon.

**NORTHERN STAR POTATO.**—It is stated that a market gardener of Daventry (Northampton), Mr. W. L. Bird, has obtained 932lbs of Northern Star Potatoes from 1lb of seed.

**THE POTATO BOOM.**—On Tuesday, the 22nd ult., at Gipsy Bridge Chapel, near Boston, six tubers of the famous Northern Star variety were sold by auction at the handsome sum of 13s. 4d. The weight of the six tubers being 13lb, the price works out at the extraordinary figure of over £995 per ton. The tubers were given by Mr. T. Kime.

# NOTES & NOTICES

## Edinburgh Spring Show—Advance Prize Schedule.

We are in receipt of the advance prize schedule of the Royal Caledonian Horticultural Society's show, to be held on 25th and 26th of May, 1904. The secretary is Mr. P. Murray Thomson, 5, York Place, Edinburgh.

## Appointments.

Mr. Geo. Burrows, for five years head gardener and bailiff to G. E. Belliss, Esq., The Dell, Kings Norton, as head gardener and land steward to Colonel Ralph Peacock, Avon Castle, Ringwood, Hants. \* \* Mr. John Stringer, gardener to the late Dr. W. C. Playfair, West Green Manor, Winchfield, as head gardener to Rowland Barran, Esq., M.P., Beechwood, Roundhay, near Leeds.

## The Future of Thingwall Hall, Liverpool.

The Hall itself, with its ten acres of land, has been acquired by the Brothers of Charity, a Roman Catholic Brotherhood. The Park of 60 acres is in the hands of Mr. Rathbone, a well-known Liverpool architect, and in place of the ordinary streets it is his idea to preserve as far as possible every tree standing at present. But all the same it will be built on.

## National Dahlia Society.

A meeting of the committee of the above society will be held by kind permission of the Horticultural Club, in the club room at the Hotel Windsor, Victoria Street, S.W., on Tuesday, October 27, at 2 p.m. Business: 1. To arrange schedule for 1904. 2. Other business. A meeting of the Official Catalogue Sub-Committee will be held at the conclusion of the above meeting.—P. W. TULLOCH, Hon. Secretary.

## Royal Horticultural Society.

The next meeting of the Fruit, Floral, and Orchid Committees of the Royal Horticultural Society will be held on Tuesday, October 27, in the Drill Hall, Buckingham Gate, Westminster, 1—4 p.m. A paper on "Pruning Roses," by Mons. Vivian Morel, will be read at 3 o'clock. At a general meeting of the Royal Horticultural Society, held on Tuesday, October 13, sixty-five new Fellows were elected, making a total of 1,206 elected since the beginning of the present year.

## R.H.S. Examinations in Horticulture, 1904.

The Society's annual examination in the principles and practice of horticulture will be held on Wednesday, April 20, 1904. A copy of the syllabus may be obtained by sending a stamped and directed envelope to the Sec. R.H.S., 117, Victoria Street, London, S.W. Intending candidates should send in their names not later than March 1. Copies of the questions set at the examinations 1893-1902 can be obtained at the R.H.S. office, price one shilling. \* \* As we intimated last week, the Society will also hold an examination in Cottage Gardening on Tuesday, June 21, 1904, for elementary school teachers. The general conduct of this examination will be on similar lines to that of the more general examination, save in obvious points on which they would not apply.

## Obituary: Mr. J. M. Kitley.

We have to report the death of Mr. J. M. Kitley, The Vineries, Little Over, Derby, who died on Thursday last. Mr. Kitley, who has been in business for himself for the past few years, was considered one of the best Grape growers in the Midlands, his crops being always well worth seeing; and he took that keen interest in Grapes that many a young man would do well to follow. Starting his career under his father—who is at present managing the Orchard Co., Ltd., of Scotby, Carlisle—he made steady progress, and eventually took over The Vineries at Little Over, where he succeeded in establishing a name for himself as a most successful grower. He leaves a widow and two children to mourn the loss of a loving husband and father. His funeral took place at Warwick on Tuesday.

## An Estate Changes Names.

We are informed that the estate lately named High Firs, at Harpenden, Herts. is now, and henceforth will be called Aldwickbury.

## The Journal's Rose Analysis.

This important analysis of exhibition and garden Roses will be presented in our next issue, October 29. It will thus be in good time, especially in this late season, for intending planters to make selections by its guidance. As there is usually a great demand for the Rose edition, it would be advisable on the part of readers to make sure of a copy by timely notification to their newsagent. Mr. Mawley promises an audit of all the garden Roses introduced during the past few years. The number will also contain portraits of leading amateur rosarians.

## County Technical Laboratories, Chelmsford.

The new buildings in King Edward's Avenue, just completed at a cost of nearly £12,000, comprise chemical, physical, and biological laboratories and classrooms, together with agricultural and horticultural museums and libraries, and provide facilities for systematic instruction in agriculture and horticulture, as well as in pure science. There is a large dairy for instruction in butter and cheesemaking and the treatment of milk, and within three-quarters of a mile is the school garden, three acres in extent, and provided with potting shed and hothouses. The laboratories are intended to be a centre for agricultural and horticultural information for the whole county, and they include rooms for the analysis of soils, manures, foods, seeds, &c., and for other scientific work carried on in the interest of these industries. They will be opened by the Right Hon. the Earl of Onslow, G.C.M.G., President of the Board of Agriculture, on Friday afternoon, October 30, 1903, at half-past three o'clock. Cards of invitation can be obtained from the Secretary, County Education Offices, Chelmsford. The laboratories will be open for public inspection from two to five in the afternoon and seven to nine in the evening of the same day.

## Festivities at Lowfield Nurseries.

On Saturday, October 3, Messrs. J. Cheal and Sons, of Lowfield Nurseries, Crawley, entertained all their employes, with their wives and families, in honour of the home-coming of Mr. Ernest Cheal with his bride, also as a welcome to Mr. and Mrs. Annett on their return from Ceylon, where they were married last March, Mrs. Annett being the eldest daughter and Mr. Ernest Cheal the eldest son of Mr. J. Cheal, the senior member of the firm. The firm had arranged for various sports in a meadow in the afternoon. The Temperance Band, composed almost entirely of the employes of the Nurseries, under the leadership of Mr. C. W. Chantler, the foreman, added much to the enjoyment of the afternoon. An adjournment was made at five o'clock to a large marquee, where over 200 sat down to a substantial tea. Mr. J. Cheal afterwards alluded to the occasion which had brought them together, and the family felt that they would like all the employes to share in the rejoicings over the double event, and it gave them much pleasure to meet together in this social manner. Mr. C. W. Chantler voiced the feelings of the employes in saying how interested they were in the events of the last few months, and how glad they were of this opportunity of wishing happiness and prosperity to the young people and continued success to the firm. Mr. Ernest Cheal also replied, saying that he and his wife were gratified to receive such a hearty welcome. Mr. Annett, too, responded. Mr. Alexander Cheal said that he should like to take this opportunity of thanking the staff and the employes for their assistance in building up and carrying on the business. He looked back over the thirty years of hard work and in the anxieties and responsibilities of conducting a business like this, it was everything to feel that they had at their backs the able and willing support of the employes. Mr. J. Cheal, later on, gave an interesting account of a recent visit to the United States and Canada, illustrated by a number of slides prepared from photos taken by himself. Mr. Annett followed with a selection of slides illustrative of Ceylon scenery and life, and the evening closed with a number of snapshots taken by Mr. Arthur Cheal during the work at the Nurseries and other home scenes, these latter exciting no little merriment among those present.—("East Grinstead Observer.")

## Winter-garden Conservatories.

From the dark heavily-built, architectural plant structures of the later part of the eighteenth century, to the elegant, beautifully proportioned conservatories of the present day, surely a good step forward has been made. The old "orangeries" are here and there to be seen even now; but they are usually put to any convenient use, and generally they do not contain plants.

Six hundred and fifty years ago, Albertus Magnus constructed a conservatory, or structure, whereby he so prevented the escape of warmth from his plants, that he not only brought them to perfection earlier, but preserved them in beauty amid the severities of a German winter. For doing this, for effecting what everyone of our readers may now effect for a few pence, Albertus was in those dark ages designated a magician, and a leaguer with evil spirits. Happy for us, then, to live in better times, with wealth, enlightenment, and beauty all around.

And the huge "crystal palaces" erected for opulent owners of private gardens, or for public corporations, are such as could never have been guessed at even sixty years ago, when glass was still taxed, when coal was dear, and heating was largely by flues. Nor were there the plants to grow. The whole race of the Japanese and Chinese trees, shrubs, and plants, as well as numberless beauties from all the ends of the earth, have practically all been disseminated to the gardens of these islands during the past sixty or seventy years.

While the figures that we are enabled to show to-day represent patterns of the highest achievements in horticultural building, what say we to the news of hugely extensive glass erections that comes from the United States? The houses there are purely for commercial uses—the growth of plants for sale; and therefore elegance is not a merit; but the figures at all events seem impressive, and may be quoted verbatim as given in "The American Florist," as follows:—

"Plans have been practically consummated for the establishment at New York of the largest greenhouse in the world. The enterprise will be backed by a capital of \$600,000 [4s. 2d. is a

dollar] and it will require an outlay of nearly \$400,000 to get the buildings on a running basis. The parties at the head of the concern have a large establishment at Brampton, Canada. The Board of Trade announces that a contract has been made with the United States Flower Company of New York, having a capital stock of \$600,000, by which this company contracts to establish near this city a greenhouse plant with an area of 1,000,000 square feet of glass to cost about \$400,000 and not less than \$350,000; the whole plant to be completed as soon as possible after the ground is broken. The company agrees to employ not less than 300 male hands in its operations, with a pay roll not less than \$1,800 per week. This plant guarantees to operate for at least five years. The total cost of the site will be \$10,750 and must be raised within one month."

The erection of glass structures, unless they be frames, or minor shelters, is seldom attempted by gardeners, nor is it necessary. Still, some men delight in doing as much as they can, and those who have made a study of the subject may be naturally proud to practise their knowledge. Books on glass house erection seem wanting, and instruction is only occasionally to be had where a society pays a qualified lecturer to give a course of lectures, as was done at Edinburgh Botanic Garden some years ago.

On pages 360 and 361 of last week's issue, we were able, by the kindness of Messrs. Richardson and Co., of Darlington, who supplied the blocks, to illustrate the exterior views of two beautiful and commodious winter gardens erected by them. We now present the interior views of the same two houses, which readers may compare with the elevation plans. Such spacious, beautifully lighted houses are specially intended for the inclusion of tree-like growths—great Tree Ferns, Wattle-trees, or Mimosa, giant Araucarias, Fan Palms, Cordylines, Bamboos—and other similar subjects, as well as, of course, the numerous dwarf-growing ornamental conservatory plants. The subjects are usually planted out. Being spacious, there is also ample room for paths and seats. In public park conservatories small orchestras are at times accommodated, but this is rare. What the cost of such erections as those figured is, we do not know, but that might soon be got on enquiry. The winter garden seen on page 373 differs in style from the other two.

## Reminders About Bulbs for Beds.

Although there are hosts of other bright flowering plants employed for spring bedding, there can be no mistaking the fact that bulbs and tubers are each year more largely used for the same purpose. Their period of beauty, though of short duration, is often the time when gardens appear in their most brilliant dress of the season, and brightness we need everywhere. Let the rich have them in their thousands, and others in their hundreds or dozens, and each will find the investment a good one. Nothing, in my opinion, tends so much to promote the "strenuous" life as the pursuit of gardening.

Although we have so far escaped any very severe autumn frosts, the season has arrived when flower beds and borders will need a thorough overhauling to prepare them for the spring display, and it is also a time when flower beds may conveniently be given their annual dressing of manure. The materials employed for the purpose should to some extent be regulated by the plants to be grown in them. If bulbs are to be largely planted, it is not wise to add manure except in a thoroughly decayed state, as the tender, fleshy roots do not work freely in fresh manure, which often harbours hosts of minute yet troublesome grubs. Old hotbed manure in a sweet condition, with the addition of a little soot, answers well. When the soil is stiff, plenty of sweet leaf soil and burnt refuse form splendid material for bulb beds, and in many establishments these are always prepared in readiness for such occasions.

As the weather is often so changeable at this season, it is an excellent plan to clear a number of beds each morning, dig them roughly, and, after a few hours' exposure to air and sunshine, level and plant them: because if rains come during the night it is often several days before the soil is again in a sufficiently dry condition for planting. With a well worked soil, the dibble answers well for planting. A suitable depth for planting Tulips is from five to six inches; Daffodils slightly deeper; and smaller bulbs, such as Crocuses, from three to four inches. Shallow planting is not to be commended, as there is nothing like securing plenty of active roots before the tops push through the soil. Fortunately, during recent years there have been many striking departures from old methods of planting, and instead of invariably massing bulbs in beds, they are often with advantage associated with other plants.

In flower gardens of geometrical design, masses of distinct colours and prominent growths are exceedingly effective, but they are shown up to greater advantage when separated by less formally arranged beds, in which the colours and forms of the flowers used are skilfully arranged.

The charms of the many varieties of Crocuses cannot be overlooked, because they bring the first touch of real brightness in early spring. It is a pity, in some respects, that they are so early, because, although often recommended for edging beds with, their flowers fade before those of most other bulbous plants open. *Scilla siberica*, however, if planted at the same time, will generally begin to flower before the brightness of the Crocuses is over. And *Chionodoxa Lucilæ* follows the *Scilla* closely. These might therefore be associated in beds where dwarf plants are needed, or each be planted separately in small beds where a touch of early colouring is desirable.

Among Daffodils and Narcissi, the following are particularly good for planting in quantity, when high prices cannot be paid: Van Sion, Princeps (pale yellow), Obvallaris (early), Golden Spur, *Bulbocodium citrinum* (sulphur coloured), Sir Watkin, and poeticus ornatus. These, with Orange Phoenix and poeticus, give a late display.

Single Tulips form beautiful combinations if planted among Wallflowers or Myosotis. Yellow Wallflowers, planted a foot or more apart, according to the size of the plants, with *Tulipa chrysolora* between, makes a particularly bright bed; and yellow, white, or pink Tulips, represented by such fine varieties as Canary Bird, Pottebakker, L'Inmaculée, or Rose Gris de Lin, planted a foot apart, with Myosotis as a groundwork, are combinations always admired. The Scarlet Duc Van Thol is a well-known dwarf early variety. Cottage Maid (white, edged rose) and Couleur Ponceau (beautifully feathered) are telling kinds to plant. Everybody should also plant a few bulbs of the peculiarly beautiful Thos. Moore (orange buff).

Violas form an excellent groundwork for Tulips of all descriptions, provided the latter are not planted closer than a foot apart. The double Tulips are particularly showy, and are excellent for massing. Gloria Solis (crimson, edged gold) is one of the best; La Candeur (white) and Rex Rubrorum (scarlet) flower simultaneously, and are good for associating in a mixed bed. The Crimson Tournesol (scarlet and yellow) is a massive flower of great beauty.

Hyacinths have the advantage of being delightfully scented as well as showy, but the price of the bulbs usually prevents them from being so largely planted as Tulips. The following varieties are particularly good: Charles Dickens (porcelain blue), L'Innocence (white), King of the Blues (dark blue), Marie (purplish blue), Norma (rose pink), and Roi des Belges (light scarlet). Those who have a fancy for a bed of many colours must not neglect the St. Brigid Anemones, for a bed of them in full beauty is one of the sights of the year, even in the finest gardens—something to engender enthusiasm by day and to inspire dreams at night!—H. D.

### Apple, Golden Spire.

The fruiting propensities of Golden Spire are surely well borne out by the accompanying illustration. It is a really useful Apple, and, moreover, is of large size, and straw-coloured. It is in use, either as a cooking or dessert Apple, up to Christmas and later, being often employed by market men. Messrs. Bunyard thus describe it: "Medium, a tall, conical Apple, of taking straw-coloured appearance, of first quality; for market or home use; hangs firmly on the tree, and from its upright growth valuable for plantations. This sort is specially valuable, as it never fails to bear even in bad Apple seasons."

Our photograph came from Mr. Taylor, Halstead, Essex.

### Notes on the Merits of Grapes.

Mrs. Pince, started early in March, sets its berries better than when started later, and the fruit ripens quite up to the shank, and when covered with its fine bloom is very taking in appearance. Alicante retains its colour well, and as a prelude to Gros Colman, is a very desirable Grape, and it is good in quality, the vinous flavour being very refreshing, and the earthiness, as in Gros Colman entirely absent, while its appearance is unrivalled by any oval Grape, except Alnwick Seedling, which is one of the best late Grapes.

The magnificence of Gros Colman renders it popular, as that goes a long way even with table Grapes, and is all-important for market. Its beautiful appearance whets the appetite, and the flavour is entirely overlooked. Beside West's St. Peter's, which is less presumptuous in bunch and berry, it is comparatively bad; yet when Gros Colman is started early, so as to allow it time to mature, the berries are not only superb, but the quality is greatly improved.

But its principal value consists in the easiness of its growth. The bunches are always compact, the berries set well, they swell to a good size, and when the Vines are not overcropped they colour well. It is far the best quality when grown on the old or new red sandstone formation, though it does well on alluvial soils, as do all the coarse vinous Grapes.

For rich vinous quality no thick-skinned Grape can vie with West's St. Peter's, but it is of no use where appearance at table is the chief merit in a Grape.

Lady Downe's Seedling is not only the best keeping Grape (we have had it excellent in June), but is unexcelled by any late Grape for uniform excellence in quality, though only about half as taking in appearance as Gros Colman, and not giving nearly so much weight of fruit per length or rod; it retains its richness to the last, simply because it contains more sugar, and mostly has a "smack" of Muscat.

In white Grapes there are some aspirants to fame, but none take a higher place than Trebbiano for appearance' sake, while being firm, crisp, and sweet.

There is Mrs. Pearson standing well out in white Grapes, and having quality, as well as other desirable properties; but, as a rule, the black Grapes hold the sway when neither Muscat of Alexandria or Canon Hall Muscat are in the race. There must not be any deficiency of moisture in the border, and the atmosphere not allowed to become stagnant, but have enough warmth with air to keep it in motion, the temperature not being allowed to fall much below 50deg until the leaves are off.—**EXPERT.**

### Renovating Vine Borders.

Where the soil is of a suitable nature, and the cultural treatment proper, Vines flourish for an indefinite period; but they are mostly planted in artificial borders, and the roots confined to limited areas. These conditions result in the soil becoming defective in nutrition, and sometimes unfavourable as a rooting medium.

Thorough renovation in ordinary cases is desirable, but a partial removal of the soil, or such portion of it as will secure active feeders, is generally attended with satisfactory results. Where Vines, therefore, are not in a satisfactory condition, no time should be lost in removing the soil down to the roots and picking it from amongst them, so as to displace as much of the old stuff as possible with fresh compost, and it is best effected whilst the leaves are upon the stems, but not before they have performed their functions to the extent of perfecting the buds and wood.

In case the border is found very unsatisfactory, and the roots few and deep, it will be necessary to remove all the soil and renew the whole border, commencing with the drainage, which

should be clear, and 9in to 12in deep, with a 3in layer of fine material on the top, old mortar rubbish, freed of pieces of wood, answering perfectly. There must be a drain under the drainage to carry off superfluous water.

The soil should consist of the top 2in or 3in of a pasture, where the soil is a good yellow or hazel loam with a sixth of old mortar rubbish, one-twelfth of charred refuse or wood ashes, and one-hundredth of crushed quarter-inch Vines, all well incorporated. Two feet depth of compost is ample, allowing about 6in more for settling, and the roots should be laid in the top foot, and in layers, according to their inclination, encouraging those from near, and at the collar, by bringing them just beneath the surface, making the whole compact, and having the soil moderately dry.

If the roots are inside and outside, one part may be done one year and another the next, without any danger of loss of crop. Take care to preserve all the roots practicable, merely cutting off broken, and paring bruised ends, smooth; and to keep them as much as possible from the drying influences of the atmosphere whilst the operation is in progress.

Afford a good watering to settle the soil about the roots, then sprinkle on each square yard 4oz of some approved fertiliser, mulch with an inch thickness of short sweetened manure, and cover outside borders with a few inches thickness of leaves with a little litter over them.—**G. A.**

## Thoughts and Things About Vegetables.

Has a new dispensation begun for the culinary vegetable? The passing of the Chiswick Show, I believe, marks the beginning of an era of greater specialisation in the products of the kitchen garden, in the varied cultures of the same, and in dressing, preparing, and exhibiting. Numbers of vegetables are left neglected and uncultivated, even while the ever-recurring cry is for greater variety. While new fruits are gradually being added to the available selections, new vegetables are not to be found. I mean entirely new products, as, for instance, the Yam, if that were brought into use—and not merely fresh varieties of Cabbages, Turnips, Potatoes, and Onions, or any other existing types.

With the idea instilled that there are numerous products—as, for example, Corn Salad, Egg Plant, Indian Corn, the Morels and Truffles, Chinese Artichokes, Cardoons, Leaf Beet, Hambury Parsley, Orach, Liquorice—that could be more liberally and more generally attempted, the department of vegetable culture will no longer be neglected to anything like the extent it has been almost till the present. And the late Vegetable Conference—the second within our ken—should have shown how useful, and necessary we should say, it would be to have an annual show of culinary produce on a large and representative scale. If joined with the yearly fruit exhibition, well and good; but, in any case, the vegetables ought to receive due consideration, that classes be prepared for all comers, and space sufficient to do exhibitors full justice.

But these notes were not intended at the opening to run along this course. I would write of "thoughts and things"—parcels of information—gleaned from Mr. A. Ireland, manager on Dobbie and Co.'s seed farm at Orpington, in Kent. It has been the writer's privilege to visit Orpington at the seed harvesting season for some years past, and though this year's journey was made late, there is still a great deal to be seen and noted on a flower and vegetable seed ground. But this was the last of these Orpington visits, for Messrs. Dobbie and Co. are removing at once to their newly-purchased land not far from Colchester, in Essex. This ground extends to some 60 acres, the tilth being of grand quality, and the village near it is Mark's Tey. In the spring, possibly, and certainly next autumn, there will be much to interest the horticulturist. By-the-bye, the firm's showing powers will be taxed for next season at least, owing to the produce having all to come from Rothsay, in Scotland; but things will be bridged over by 1905.

Giving the vegetables the place of honour, what has to be said will be as briefly put as possible. Turning to the Red Cabbages for a start, Messrs. Dobbie are able to show a small-headed variety, named the Small Blood-red, a neat, firm Cabbage, which is a selection from the Large Red. Its advantage is that it is dwarf, and many more plants can be planted on a given piece of ground than could the Large Red. It is curious to notice that Red Cabbages can never be grown on the same seed farm with any other variety of the species without fear of almost certain interpollination; and while the Reds affect the ordinary Cabbages, the latter never can show their influence on the Reds to any extent.

Some attention has been drawn to Dobbie's Large Red Shallots, through their having been taken exception to at a Kent show, the judges stating them to be Russian Onions. This has authoritatively been proved incorrect; they are a large form of Shallot,

though over-sized for market purposes, and are a type sought after in the North by gardeners and cottagers whose soil is unsuitable for the successful growth of true Onions, such as Ailsa Craig, Golden Globe, or Cranston's Excelsior. And, while Onions are the theme, let me say that Golden Globe has yielded a goodly crop of well matured, dry seeds this year, and the growths had been very robust. One ton of bulbs were planted last year for seed production, which shows what a demand there is for it.

Not very many Tomatoes were a success in the open air this year; but in Champion, growers must surely find a meritorious sort. Both indoors and out, at Orpington, the plants have well repaid their space. Nine nice rounded fruits per truss, and the fruits evenly coloured all over, with firm, relishable flesh, are points ordinarily to be noted in Champion; and out of doors the plants were three feet high, clothed all their length with leaves and fruit, and as they were planted from 7-inch pots at the end of May, bearing then their first cluster of fruits, they had a good chance to make the best of the season. They are planted in rows 2ft apart in the open seed ground, but a little shelter was given at first by placing Bean and Pea stakes around the outer fringe of the area. The seeds from this Tomato are now being obtained. The process adopted is to squeeze the fruits through a half-inch sieve, the pulp falling into a tub. Here it

The new purple Beet, too, furnishes a fine product, the roots being of medium size, smooth, tapering evenly, with a dark blood-red skin and flesh. Most growers will agree that the darker the flesh the better is the Beet liked, and in that point this selection is perfect. Parsley, too, must be had, but how often we are content with the coarser kinds. Without fear of any contradiction, I may say that the Rothesay firm's Selected Parsley is the finest (in a double sense) on the market, and no further commentary is necessary when I state that its culture, for seed, runs into acres.

These observations on vegetable crops may conclude here, and the flowers will have their turn at another time; but I must bear testimony to the extreme care on the manager's part in selecting only the finest samples of the firm's stock for seed purposes, and his unwearying cultural application, from sowing to harvesting.—WANDERING WILLIE.

## Begonia, Gloire de Sceaux.

Presented in perfect form and flower, there is scarcely another Begonia that possesses such noble characteristics as this French-raised variety; even the now familiar Gloire de Lorraine pales before its noble grandeur. There is, however, scarcely a com-

Apple, Golden Spire.

remains for twenty-four hours, which seems to make the washing easier, and washing is the next step. The pulp being placed in portions into a fine sieve, it is then washed through, the soft material, of course, being carried away, while the seeds remain. They are then dried and looked over, preparatory to selling.

A good frame Melon is often sought for, and nothing yet beats Monro's Little Heath, and the Cantaloup, both of which produce splendid dessert fruits, the latter, of course, much the larger.

The Golden Ball Turnip was much admired in Dobbie's stand at Chiswick, and though yellow fleshed Turnips are not in favour southwards, the northerners have no such aversion, and no less than 40 bushels were sent this year to Rothesay. The firm has a new early Turnip now under trial, this being a cross between Early Milan and Model White. Earliness and depth of flesh are the two points desired.

Turning to culinary Peas, there are three that might be remarked, being the Gladstone, which is undeservedly overlooked at times; Alderman, and Glory of Devon. The latter has been far more liable to the Pea weevil this year, and to mildew, than either of the others at Orpington. Then there is Dobbie's Champion Scarlet Runner, that obtained an award of merit this year at Chiswick against others. It is a heavy cropper, the pods being long and succulent and weighty. Some exhibitors grow it, I believe, on poles twelve feet long, placed diagonally against each other; but at the seed grounds here the plants had been pinched at three feet in height.

petition between these two kinds, because the one is an early winter variety, the other has its season late in spring. It would seem that Gloire de Sceaux, like many other plants, has what may not be inaptly termed "fads," for in some gardens the culture of a plant will be regarded as the essence of simplicity, while in another the same issues are reduced to quite a science.

Remembering the many attempts one has seen and can recall where failure predominates rather than success, it was not a little refreshing to come upon a fine batch of luxuriant specimens quite recently in one of the warm stoves in the Leighton Gardens, Westbury, over which Mr. George Bound so ably presides. They are reproduced annually from cuttings, as old plants are neither safe nor satisfactory. They are rooted in the month of May, and by periodical shifts attain to large proportions in 6-inch and 7-inch pots. At the present time, while still active in growth, they stand some three feet from the ground line, and some of the strongest have a diameter in leaf growth of about the same proportions. What they seem to delight in is plenty of moist heat, without resort to syringing, and, at the same time, shade from bright sun. They do not make the needful progress when stinted of fire heat, nor do they revel in exposure to sunshine; but even with these items studiously remembered and acted upon, this Begonia baffles the efforts of some gardeners to create a satisfactory display in spring. In Mr. Bound's collection it was plainly indicated what influence fresh soil and periodic repottings had upon the growth and development. For the warm conservatory, when Lorraines have spent themselves in spring, Gloire de Sceaux replaces them excellently.—W. S.

### *Spiræa Thunbergi.*

The short notice (page 327) of this, one of the most elegant of all the shrubby *Spiræas*, served to remind me of an old favourite amongst this not too highly appreciated class of plants. The illustration upon another page of the same number scarcely does the plant justice. Where the plant succeeds, its long arching growths of delicate greenery are very beautiful, especially in spring, and make excellent material for associating with many blossoms. The small white flowers are pretty and very freely produced. It is true the plant likes a rather warm and sheltered position, but it is a pity to see it, as one sometimes does crammed into shrubberies with scarcely room to breathe, so to say. Given room for development a well-grown bush is a charming object and worthy a position in any garden.—COUNTRYMAN.

### The Colouring of Apples.

In answer to "Lamasool" (page 359) I have observed during many seasons that Apples very much increase in colour after the first "snap" of cold, and rarely, I think, attain good colour without it.—W. R. RAILLEM.

An interesting theme is that put forward by "Lamasool" (page 359). The problem, however, seems to me one that needs the science scholar to deal with satisfactorily, for without scientific knowledge and training it could not be readily said what are the influences of wind, rain, and cold nights bearing on this matter of Apple colour. If wind and rain account for the higher trend of colour in Apples, surely the passing year has been one that should have given of that quality in abundance; but some will be heard to say, fruit is absent this year, and thus no food for experimental thought exists. There are Apples in some places, even in this barren year, and at the late Chiswick Show one ought easily to find an answer to such query. Personally, I did not come away so much impressed with the Apple colours, save those grown under glass; these certainly had colour so highly developed that it almost appeared overdone; and why this in glass-grown fruit, when outside so little excess was apparent? I quite believe that rain in the autumn tends to the development of colour in late Apples, but that the theory of wind and cold nights being a still greater power, extends somewhat beyond my grasp.

The few pertinent questions asked by "Lamasool" give rise to a few more, at least to the thinking reader, and probably the more one thinks, the greater depths of unintelligible vein extend beyond his sphere, except, of course, as before said, to the scientifically trained scholar. When the mind rests on sharp, cold nights for a moment as being a factor in developing colour, one is made to reflect on the warm nights of August, and compare their issues, and also that of rain and wind with the Apples that ripen and are gathered in that month, notably Beauty of Bath, Red Astrachan, Devonshire Quarrenden, &c., and the somewhat later Williams' Favourite, Gravenstein, or Lady Sudeley. In these are to be seen as good colour as in that of later autumn and winter fruits, and the same may be said of Pears.

Then, too, a change of root environment is sometimes made to accelerate fruit colour. By root-pruning I have instances this year of a change of colour which almost places the fruit beyond recognition compared with former memories; yet no change happens in the form of the tree or its treatment other than its roots; but the same influences from wind, sun, and rain are present, not more or less than heretofore. In the growth of pot trees neither rain nor cold winds can have any far reaching influences, yet the colour developed in their fruits is such that the merest novice can distinguish between them and the outdoor grown specimens. There is scarcely any ground for argument in dispensing with sun, rather than wind and rain, so far as it affects colour in Apples. A crowded tree will soon give a foretaste of what would happen without the influence of sun acting upon the fruit. This would also prevent the action of rain and wind.

Though rebutting evidence may be brought forward tending to diminish one, or enhance the influence of another, of the several factors, one must even then voluntarily recognise that each play their separate part tending towards this natural development, not only in Apples, but other fruits as well. A wall-trained tree affords an example. Here there is a higher and more delicately toned complexion in the fruit, yet they are subject to the same influences, rain, wind, and sun, variously modified, the same as the open-air tree. There is, and must be, so to speak, a confusion of theories when the several factors are

analysed and comparisons made dealing with the circumstances as they concern the tree, the variety, the weather, or the cultivation. I incline to the opinion that the chemical constitution of the soil has the most marked influence on colour.—W. S.

[If "W. S." refers to the pot-trees as shown by Bunyard for example, we would say that these are finished in the open-air, and not under glass.—Ed.]

In reply to the inquiry made by "Lamasool," it is, if I mistake not, during the last year or two that I contributed a reference to this subject in connection with certain effects on the growth of Peas, to which I will recur presently, as I attribute both results to the same cause; but will first refer to Apples. Several of the great shows at the Crystal Palace of the Royal Horticultural Society of autumn fruit have been successively described as rather "green," and wanting in colour on the average, in comparison to other years. We had a fair opportunity for observation in the course of the series of dry years from 1893 to 1901, when the excess of sunshine should, according to popular thought, have resulted in a colour picture of Apples shown; but which were precisely the seasons declared "green." It is thus I have what I think recognised the probably true cause of differentiation. It is well known that the sun's heat is requisite for the highest nitrification of the soil, so that this development occurs most effectively in the months of July and August; but as nitrates primarily foster vegetal growth, it is the size of Apples which is thereby affected, other features, such as quality, flavour, and colouring, depending on other factors.

When relatively heavy rains fall about August, their effect is to cool the ground; nitrification is checked, and growth of fruit suspended, and energy diverted to the promotion of the other features referred to. Indeed, this is proved in relation to colouring by copious watering and syringing of Apple trees about August in droughty seasons, which latter, if continuing through September, would produce generally a "green" crop. The effect of water on colouring is best attained at the period of about six weeks to a month before picking, be it natural or artificial.

As to results on Peas, I have repeatedly read about a want of effect of farmyard manure on crops gathered after the earlier ones, say well into July and later, whereas earlier crops show the distinct difference between well-manured and unmanured crops of that vegetable. The cause is that the natural nitrification of the soil in July and August overlaps the effects of dung, which is, therefore, relatively useless on later crops, and could with advantage be replaced by watering.—H. H. RASCHEN, Sidcup, Kent, October 19, 1903.

### Rose, The Meteor.

In the Journal of last week it is stated that this Rose is not described in the last (tenth) edition of "The Rose Garden." If the writer of that notice, wherein he so faithfully describes it, will turn to page 332 of the tenth edition, he will find it described and commended under the letter "T."—The Meteor. I know of no failings, and should speak of it in ordinary conversation as a beautiful Rose. Although not one of my seedlings, it was first sent out by my firm some years ago. It was raised by the late Mr. Henry Bennett, and sold in the first instance to a grower in America.—WM. PAUL, Paul's Royal Nurseries, Waltham Cross.

### Potato, Northern Star.

I learn that 420lb of tubers of the above came from 2lb of seed. (This is a bona-fide crop, by the way, grown at Liphook, Hants.) This, however, is nothing very startling, compared with the crop of 1,301lb got from 1lb of seed of Empire State Potato in 1885, in America; nor does it equal the thirteen bushels grown in England by a gardener of Lord Londes many years ago, and shown in London. Like many others, Mr. Yates (page 337) asks what is the source of Northern Star's origin. We are not told. We learn how hybrid Orchids are raised, but the humble Potato—we have to be satisfied to get it. An eminent foreign Potato raiser has stated now all his seedlings were obtained in order to show buyers what sort of "blood" is in them. Under the dumb system we get a new thing, that whilst in its early youth appears vigorous, yet after a few trials suddenly collapses or loses its original qualities. Even Northern Star is not entirely fixed. Mr. Yates expects the millennium when he waits for a disease-proof Potato. Northern Star certainly stands longer than any, although one Kentish grower states that his were diseased as quickly as other sorts. As for cropping powers by ordinary backyard culture, I know one grower who grew Northern Star, yet his crop in no way equalled Sir J. Llewelyn.

To get nearer home, however, Northern Star alongside many others in my plot was a disgrace at lifting time. I absolutely refuse to state how many I lifted, but it was bad; nay, worse than my worst. That is to say, worse than any hill of any variety that had haulm. Respecting Evergood, I may tell Mr. Yates that it has been out several years, for it sells at 16s. per cwt., and he may take it from me that Evergood is almost as long standing as Northern Star, with about ten times the cropping capacity on

my sticky soil. In Lincolnshire it lifted 18 tons per acre, with an average of 3lb of diseased tubers per ton. As for King Edward VII., which was sent out this year, I know for a fact it has lifted at 18½ tons per acre under field culture in Lines, and last year it was over 20 tons per acre, with little disease. King Edward VII. out-yielded Northern Star in about the same fashion as the moon does the light of Jupiter, although my soil is not suited to growing large tubers. Moreover, King Edward VII. is a second-early, and the most beautiful coloured Kidney variety ever sent out; whilst Evergood is one of the most taking white Rounds to-day. Northern Star as a showman's "tater" is of little use, and the cottagers who paid 10s. per pound (and I believe there are some) probably have found that their old sorts, of no market value, are still necessary to win prizes. In a word, Northern Star is the most disappointing variety I have grown this year. Perhaps if I had coddled it under a frame and planted out on a specially prepared warm bed I should have lifted a hundredweight or two; but I did not, and that is the end of the tale.—T. A. WESTON, Porthing, Hythe, Kent.

### Orchid or Violet Day?

Following last week's note on page 352, Mr. Chamberlain should, I think, have a flower day, to be instituted on similar lines to the Primrose Day; but I would like to suggest Violets in place of Orchids, because I think Orchids are only for the few; whereas Violets may be obtained by all classes, that is, if the Violet is popular with Mr. Chamberlain. If not that one, possibly there may be another hardy flower that could be named for the purpose by making enquiries. There are so many sorts and classes of Orchids that I fail to see how it could be successful.—A. J. LONG.

### A Hint for the R.H.S.

Mr. W. Bateson, F.R.S., is reported to have asked "whether some new and great beneficial departure could not be made when the new Wisley Garden is taken over? May the taking over of Wisley," he asked, "not be used for the determination of the hybridisation experiments that are now so paramount?" Well, that is great work; it is necessary work; and it is a work we should, I think, all vote for, to be undertaken.

Leaving that, however, might I suggest that the Royal Horticultural Society begin the formation now, of a collection of models of Apple and Pear fruits (these more particularly), to be placed in cases round the walls of the new hall being built at Westminster?

The Orchid Committee are wise in their day and generation, for they made a rule long ago that every striking new Orchid that obtains a certificate shall be painted, and they carry this rule very fully into effect. Is it not time that the Fruit Committee should possess a collection of 100 or 150 types of Apples and Pears modelled in wax or other substance? London is a great centre; and in the interests of students of pomology I think such a collection ought to exist. Printed cards containing a few particulars of the varieties, and possibly a woodcut block, to show the character of the tree (where such is distinctive), would be needed to accompany the models.—METROPOLITAN FELLOW.

### Autumnal Strawberries.

As one of the members of the Ipswich Gardeners' Society who had the pleasure of inspecting the Strawberries at Sproughton Rectory, permit me to cordially endorse the remarks of "J. H. D." on page 350. I had intended sending some notes to the Journal on the subject had not the genial Rector informed us that a representative of the staff had visited him a short time previously. It was a miserable, wet afternoon on the occasion of our visit, so that there was but a small muster of members; however, those who had braved the elements expressed themselves as amply repaid by the sight that met their gaze.

Mr. Foster-Melliar, with his usual courtesy, gave us all the information in his power about his method of cultivation. "Go inside and taste them," said the Rector; "I doubt the flavour won't be very grand after this wet weather," observed one individual on the quiet. He was the last to leave the bed, so had probably changed his opinion. The variety St. Joseph impressed the visitors most; it is an enormous cropper, possesses an agreeable flavour, while a great point in its favour is the relatively small foliage, so that the trusses of fruit elevated on the wire supports are fully exposed to the sun, and at the same time kept away from the damp soil, an absolutely essential condition with these Strawberries. St. Antoine de Padoue produces larger fruit than St. Joseph, but is not such a free cropper. The foliage is also much too vigorous, notwithstanding the drastic treatment resorted to by Mr. Melliar to destroy the fungoid attack. In his concluding observations "J. H. D." thinks it improbable that their culture will be taken up by the market men; nevertheless, I know of one local grower who has disposed of several pecks this season at a remunerative price.—E. G. CREEK, Westerfield House Gardens.

### Notes on Roses.

No time should be lost in pruning all climbing varieties, other than autumn flowering sorts like Aimee Vibert or Dorothy Perkins for example. The method of pruning climbing Roses is very different to that required by H.P.'s or Teas. In the latter case, close pruning gives the best results, the best blooms coming from the growth of the current year. Not so in sorts like Crimson Rambler, Aglaia, and The Lyon. True, these flower from spikelets, so to speak, but the foundation shoots from which these spring are the result of growth the preceding year. In Roses of this section, maturity of growth has much to do with their future success. How shall we obtain maturity, or in other words, ripened wood? Not by allowing all the summer-made growth to become thickly entangled, quite excluding light and air, and remain so until what is known as the general Rose pruning time, April. Directly the flowering season is past pruning should commence.

Why leave these superfluous growths until the spring, when they can be as well cut away now? The material we require to give a full crop of handsome flowers is strong, vigorous shoots growing from the base, and fully 10ft long, or more. If these are exposed thoroughly to air, sunlight, and wind, maturity is effected as growth progresses; and when flowering time once more comes round, very different will be the result as compared with those treated the reverse.

Cut away all shoots that have given a full crop of bloom, except in some instances where added growth is being made, even if it be not direct from the base. Weakly shoots should come out also; such are of little aid. When all are pruned away that is thought to be necessary, tie those remaining to the supports, whatever they may be, spreading them out as thinly as space will admit. If by any means, owing to position, the soil about the roots is not moist, give it a thorough soaking to enable the plants to perform their proper functions of bud formation in the embryo stage; and bear in mind that this section of Roses is quite on an equal with fruit trees, viz., that the foundation of next year's fruit promise is laid this year.

### MAKING NEW ROSE BEDS.

When new Rose beds are to be made this autumn, no time should be lost in making preparation so that early planting can be done. Roses planted in October are much more likely to succeed than those put in the ground in January, or even December. Roses are not like fruit trees; the latter do not, as a rule, make new roots immediately, but Roses *do*, when planted at the time suggested; therefore it is an advantage to plant early. So much of the future success of Roses depends upon the method of preparation and the manipulation of the soil, that all means to ensure success should be adopted.

Deep trenching of the soil is an important factor in Rose growing, especially where the subsoil is of a heavy, retentive character. Roses enjoy copious supplies of moisture at the roots during the period when growth is being made; but they cannot resist stagnation about their roots, during the winter and spring months especially. In the case of heavy soil, trench it fully 2ft deep, breaking up the bottom another 6in; this latter admits of a quick percolation of water from heavy rains. For ease in the after stirring, the surface soil in trenching should be retained in the same position as before—on the top. While trenching is in progress, add half-rotted stable manure freely, also decayed vegetable refuse, wood ashes and road grit, all of which tends to bring the soil into a more workable condition, rendering the rooting space for the Roses more congenial, and imparting vigour to the growth also.

Where light, sandy soil has to be dealt with, Rose growing is not always so successful as in the case of the opposite kind of soil. Trenching need not be so deep; but a quantity of manure must be added—this from the cow sheds if possible—as also a quantity of clay, incorporated with the sand. A 3in covering of decayed vegetable refuse, wood ashes, and road grit spread over the surface of heavy soil after trenching, will assist the planting considerably. If trenching is done at once the soil has time to settle down a little before planting time.—HAMPSHIRE DOWNS.

**PHILADELPHIA RAMBLER ROSE.**—The new Rose, Philadelphia Rambler, is well thought of as an improvement on the original Crimson Rambler.

**SELECTION OF ROSES.**—"Herefordshire Incumbent" desires to add the following varieties to his list, given on page 349:—H.B. Madame Isaac Pereire (cannot be too highly recommended); H.B. Souvenir de Malmaison (just half century old, but always young).

## Another Bothy Plan.

**GROUND PLAN.**—All the ground floor is covered with alternate black and red tiles, 6in by 6in, laid in cement. The walls of the room inside are of glazed brick. For a height of five feet they are of a light green colour, and above that, white. A sitting room and a dwelling room are provided, and, for greater seclusion, a reading room also.

To support the partitions dividing the bedroom to the left of the upstairs plan, a strong iron girder spans the width of the building, and three smaller ones join it at the points indicated. This is done in preference to having stud-work, which is, of course, less desirable than bricks. There are six bedrooms and a bathroom. The walls of the latter are faced inside with glazed bricks, but the bedroom walls are plastered and coated over with a light green colouring. There is a fireplace in each room.

The exterior walls, and also the central one supporting the chimneys, are one and a half brick thick. The quoins are of granite, or, if this is not obtainable at a reasonable price, Bath stone. The other walls (with the exception of those resting on the girders) are nine inches thick, while those over the girders are four and a half inches. Views of the front and east end elevation are given. The estimated cost is about £275, exclusive of labour.—WM. ROWLES, Under-Gardener, Irwell Bank, Eccles, Lancashire.

### ITEMS OF EXPENDITURE.

	£	s.	d.
1 Common red bricks, 69,225 .. ..	102	0	0
2 Glazed (white and green) bricks, 5,525 .. ..	12	0	0
3 Stone, 132 blocks .. ..	49	1	0
4 Tiles, flooring, 3,220 .. ..	8	16	0
5 Roofing slates, 1,400 .. ..	28	0	0
6 Beams .. ..	12	15	0
7 Rafters, 1 .. ..	11	5	0
8 Other roofing timber .. ..	5	0	0
9 Flooring boards .. ..	4	16	0
10 Lathes .. ..	3	5	0
11 Plaster .. ..	16	10	0
12 Girder (iron), 50ft. in all .. ..	6	5	0
13 Windows, including glass .. ..	10	2	0
14 Doors .. ..	3	18	0
Total .. ..	273	13	0

## Societies.

### R.H.S. Scientific Committee, Oct. 13th.

Present: Dr. M. T. Masters F.R.S. (in the chair); Messrs. Saunders, Worsdell, Masee, Gordon, and Holmes; Drs. Rendle and Cooke; Revs. W. Wilks and G. Henslow, Hon. Sec.

*Chrysanthemum leaves, spotted.*—Mr. Saunders exhibited leaves apparently encrusted with some mineral. Mr. Holmes undertook to examine it.

*Male Figs.*—Dr. Masters observed that he had several instances of Figs sent to him that failed to ripen. They were remarkable for containing entirely male flowers; ordinary Figs being entirely female, but ripening without fertilisation, except in the case of the Smyrna Figs, which require "cauprification."

*Potato disease.*—Dr. Cooke replied to enquiries as the transmission of the mycelium from the leaves down the stem being the only means of reaching the tuber. His opinion was that the disease may be communicated direct to the tubers while young and with a delicate skin, or when bruised or wounded.

*Clematis parasite.*—He also reported on a new disease, which Mr. Chittenden named *Ovularia clematidis*, and exhibited at the last meeting. Dr. Cooke supplied a technical description of the fungus, and adds: "No experiments have been made to check this parasite. If it should establish itself, it would be well to try powdered sulphur at first, and if this be not successful to use Bordeaux mixture."

*Vegetable monstrosities.*—Mr. Worsdell exhibited a spray of *Pelargonium* with foliaceous bracts at the base of the umbel, and a fasciated peduncle; also flower heads of *Scabiosa purpurea* with proliferous axis. Mr. Wilks observed that this is particularly common on German plants.

*Lilac injured by insects.*—Mr. Gordon showed branches attacked by some insect, on which Mr. Saunders has reported as follows: "The Lilac leaves were injured by the caterpillars of a small moth, one of the *Tineina*; but nearer than that I cannot say. The caterpillars had taken their departure from the leaves, and had no doubt buried themselves in the ground beneath the bush and become chrysalides within a couple of inches of the surface. I should recommend that a good dressing of kainit should be given, and that it should be chopped in with a hoe; this would probably kill a number of them. When the leaves are opening in the spring another dressing would be useful to prevent the moths making their way to the surface."

*Potatoes diseased.*—Mr. Gordon also exhibited Potatoes badly attacked by *Chrysophyetis endobiotica*. This fungus was introduced from the Continent, and first appeared in Cheshire. It has completely destroyed crops in allotments this year in Nottinghamshire.

*Wound parasite of Apple trees.*—Dr. Cooke also reported upon some examples brought by Mr. Chittenden. The fungus is *Hydnum*

*Schiedermayeri*. It formed a strip of about 4ft growing through the bark. This fungus is said to be very destructive to Apple trees, the spores entering through a wound in the bark.

*Tomentum on Vine leaves.*—Dr. Bonavia sent leaves to show how closely natural woolliness, or tomentum, resembled the red spider's web, and that it was impossible to distinguish them by the naked eye. Mr. Saunders observes: "I should not think it could be possible for anyone to distinguish between the tomentum on the leaves and the web spun by the red spiders with the naked eye, unless the webs only covered parts of the leaves, in which case the under sides of the leaves would have a patchy appearance; but the similarity between the web and the tomentum is so great, that otherwise no ordinary eye could detect the difference. Under the microscope the threads of the tomentum are twisted, and do not lie so straight as the threads of the webs."

## The Horticultural Club.

### ARCTIC NATURAL HISTORY.

The lecture by Mr. Charles E. Pearson, on "Bird-nesting in Russian Lapland," before the Horticultural Club, on October 13, was extremely interesting, and photographs were shown of eggs of many kinds and views of the scenery within the Arctic circle, plus a number of native plants and flowers. Mr. Pearson began by apologising for choosing a subject somewhat out of the horticultural line, but in point of fact, apart from the intensely interesting pictures of eggs and nests, there were such charming examples of Arctic flowers and Arctic landscapes that an apology was utterly needless, especially in view of the lecturer's treatment of his subject, at once humorous and instructive. Clutches of eggs of a great number of birds were shown exactly as they were found, the photographs being taken from above, thus affording a full view; and it was really marvellous to note in many cases how the seemingly capricious blotchings and markings of the eggs masked them from prying eyes, owing to their consequent close imitation of their surroundings. In some cases, too, it was difficult to dispel the idea that the birds had not also selected a site amid rounded pebbles of similar outline and colour to the eggs, in order to aid this masking, so exactly did they resemble each other. Eggs and nests—the latter in many cases being practically non-existent, the eggs lying among bare stones—were shown of the buzzard, redwing, eagle, gulls, eider duck, wild swan, oyster-catcher, dotterel, and many others, each being accompanied by a vivid description of the habits of the birds and the various adventures which attended the discovery of the carefully hidden eggs.

Hours of motionless waiting, accompanied by myriads of industrious mosquitoes working their sweet will on every exposed portion of skin, were sometimes needed ere the disturbed mother bird would settle down on the otherwise undiscoverable nest. Long leagues of difficult travel over several feet of treacherous snow precluded many of the discoveries; and in this latter connection a most laughable description was given of the difficulty of bargaining with a rapacious jehu by the mediation first of an interpreter who translated the English into Norwegian, then another who did the Norsk into Finnish, and finally a Finn who knew some Russian—no little speculation resulting as to the form in which the original remarks reached their destination.

Some of the photographs gave a clear idea of the marvellous rapidity of Arctic vegetation during the brief summer. A dense and robust mass of *Caltha palustris* (the Marsh Marigold) was, for instance, shown in full flower on a spot which, three weeks previously, was deep in snow, and only fifteen days before had been observed as just evidencing growth. Barley is stated to be ripe within thirteen weeks of sowing. This the lecturer imputed to the long and continuous daylight, and a relative photograph showed the midnight sun fairly high in the sky. Some lovely specimens of *Myosotis alpestris*, *Silene acaulis*, Bog Cotton, and other flowering plants evidenced also the beauty of the Arctic flora, as well as its rapidity of development.—C. T. D.

## Sheffield Floral and Horticultural.

### (Interesting Report of Annual Meeting.)

The annual general meeting of this society was particularly well attended, and much interest was evinced in the business. The Secretary's report dealt with some very important matters. Recently the society had approached other district societies with the view of bringing about an amalgamation of the whole, so that one first-class exhibition should be held, but the small local societies cling tenaciously to "restricted areas." The honour (?) of carrying on a show, and of being "on the committee," probably weighs, but the Sheffield Society has one paramount object—that of securing the advance of horticulture, and there is an absence of personal considerations. Every effort is to be made to make the next show one of the leading exhibitions of the year. The Duke of Norfolk has become President; Mr. W. Lewendon, F.R.H.S. (93, Neill Road, Sheffield) was unanimously re-elected Secretary; and Mr. A. Watson, Chairman of Committee, which includes such men as Messrs. J. Artindale, J. Bennett, T. Swain, J. Marsden, B. Bray, &c. The 1904 show will be held on Saturday, August 13, in the beautiful grounds of Holly Court, by

kind permission of F. A. Kelly, Esq., and special classes will be arranged to attract some of the leading exhibitors. The next meeting of the society, on November 4, will be particularly attractive, Mr. T. Snowden being scheduled to give "Impressions of the Horticultural Traders' Trip to Holland and Belgium in April, 1903." The Secretary would be glad to hear from any friend who would like to be present.

### Reading Gardeners' Association.

The fortnightly meeting was held on the 12th inst., and, notwithstanding the exceedingly rough weather experienced, between seventy and eighty members assembled, under the chairmanship of the President, Mr. Leonard Sutton, to hear a lecture by Mr. G. Wythes, V.M.H., of Syon House Gardens, Brentford, on "Strawberries and Their Culture." As the lecturer was well known to the majority present as an authority with regard to the Strawberry, and also as a large grower, much was expected by the members, and it was a source of gratification to all that the expectations formed were more than realised. The subject was not only treated exhaustively, but in a plain and practical manner. The points touched upon were, the preparing of plants for forcing, varieties for forcing, the routine of culture, Strawberries in the open ground, prolonging the season, culture after planting out, Alpine or small kinds, and last, but which proved the most interesting, Strawberries as annuals or yearlings.

Great stress was laid upon the fact that it was most desirable that plants should be grown purposely for runners and not allowed to fruit. As to varieties for forcing, Royal Sovereign was recom-

mended for early supplies, to be followed by Vicomtesse Hericart de Thury, La Grosse Sucrée, and President for late use; while for the "annual" system of culture Royal Sovereign, President, Dr. Hogg, and Gunton Park were advised.

The discussion which followed brought out several points of interest. Those taking part were the President, Messrs. Fry, Powell, Judd, Exler, Hinton, Turnham, Townsend, Gibson, and Tunbridge. For the reason stated above, the exhibits were smaller and less numerous than usual, but the certificate of cultural merit was awarded to four especially fine fruits of Sutton's Royal Jubilee Melon, staged by Mr. G. Herridge, The Gardens, St. Peter's Hill, Caversham. Mr. Durrant, The Gardens, Preston, exhibited a plant of Regina with yellow flowers. A hearty vote of thanks was accorded to Mr. Wythes and the exhibitors. Seven new members were elected.

### Bristol Gardeners'.

The opening meeting of the winter session was held at St. John's Rooms, Redland, on Thursday evening. The chair was taken by Dr. Barclay J. Barron, and a most instructive lecture was given by Mr. J. C. House, of Coombe Nurseries, Westbury-on-Trym, his subject being "Hardy Perennials." A special feature of the evening was a magnificent collection of fifty kinds of perennial flowers grown by Messrs. Isaac House and Sons. Pyrethrums, Pentstemons, Michaelmas Daisies, alike were beautiful, showing the amount of care and attention bestowed upon them. The society unanimously awarded them a certificate of special merit for this display. Dr. Barron, on passing a vote of

thanks, hoped the society would continue to maintain the steady progress it had made since its formation, and expressed the hope that more of the Clifton gentry would interest themselves in the good, sound, and useful work being done. Prizes for six bunches of perennials were awarded to Mr. A. Baker (gardener, Mr. Orchard); Lady Cave (gardener, Mr. Poole); and Mr. J. C. Aitken (gardener, Mr. Clarke). For a basket of autumn foliage and berries, the prizes went to Mr. R. Ambrose, Mr. Cary, and Mr. R. Poole. Certificates of merit went to Mr. A. Cole (gardener, Mr. Bird); for six vases Begonias, Mr. H. Daniel (gardener, Mr. Quick); for one Orchid, and for two Orchids, to Mr. F. C. Fisher (gardener, Mr. Shelton).

### Liverpool Grain, Root, and Fruit Show.

In the Potato classes everything of note was staged in the perfection for which Lancashire and Cheshire growers are noted. The following list of winning varieties should prove valuable in such a season as this.

White Early Kidney, first, Mr. B. Ashton, Lathom House, Ormskirk, with Sir J. Llewelyn. Sutton's Early Regent, first, Mr. F. Grey, Halsall. White Early Round, Mr. G. Ashley, with beautiful Sutton's A1.

White Second-early Kidney, Mr. John Eccles, with Crocus. White Second-early Round, first, Mr. E. Davies, Partington, with Windsor Castle.

Early, or Second, any other shape, Mr. Jno. Niven, with World's Fair, Snowdrop, or Lord of the Isles; Mrs. Johnson with Snowdrop.

The classes for Reading Giants, Sutton's Abundance, and Sutton's Satisfaction were splendidly contested. Class 21 was for Up-to-Date, General Roberts, or Scottish Triumph, the former variety easily asserting itself. Maincrop or Langworthy: first, Mr. B. Ashton, with the former, in grand condition.

Late Kidney: Mr. J. Parker, with Bank of England. Late Round: Mr. E. Davies, with Industry. Late any other shape: Mr. D. Oldfield, with The Crofter, in superb form.

Coloured Early or Second Round: Mr. E. Alty, Aughton, with Reading Russets. Peerless Rose was the winner in the Kidney class; whilst for late coloured Kidney and round, Messrs. T. Reason and J. H. Carter scored with extra Edgecote Purple and Adirondach. The six heaviest tubers were Reading Giants, weighing 15lbs 4ozs, from Mr. J. Needham.

New varieties, any colour: Early Second or any other shape Kidney, Mr. B. Ashton gained first and special, with a grand dish of Webb's New Guardian. In the corresponding class for Rounds Mr. J. Johnson led with Lord Curzon. Late or any shape Kidney: Mr. G. Ashley, with Cramond Blossom. Late Round: M. J. Needham, with a fine sample of Evergood.

Messrs. Sutton's Specials: Best three dishes selected from their varieties, first, Mr. T. Reason, with Abundance, Satisfaction, and Favourite; second, Mr. J. Johnson, with Abundance, Satisfaction, and Ideal. Best dish: first, Mr. E. Davies, with a faultless dish of Satisfaction. Sutton's Reliance: first, Mr. J. Johnson.

Messrs. E. Webb's Specials: Dish of Early or Second-early Kidney: First, Mr. B. Ashton, with handsome (Webb's) Wordsley Pride. For early Rounds, first, Mr. J. Johnson, with Renown (Webb). Late Kidney: First, Mr. J. Parker, with Webb's Motor. Late Round: First and special, Mr. J. Haycox, with Webb's Goldfinder, one of the best dishes in the show.

TRADE EXHIBITS.—Messrs. Dicksons, Limited, were forward, with a particularly fine table of fifty dishes of Potatoes, with capital specimens of Pioneer (late Kidney, extra fine), New Century, Royal Standard, Diamond Jubilee, The Dickson (a good looking midseason Kidney), Evergood, and the famous Northern Star. Messrs. Webb and Sons had Wheat and Barley.

### Metropolitan Public Gardens Association.

OPEN SPACES.—At the monthly meeting of the Metropolitan Public Gardens Association, held at 83, Lancaster Gate, W., it was stated that a legacy of £100 had been paid to the association under the will of the late Miss Rachel Duncombe. It was agreed, in view of its detrimental effect upon public spaces, to urge the Paddington Borough Council to appeal to the House of Lords against the recent judgment of the Court of Appeal in reference to St. Mary's Recreation Ground, whereby it was decided that a public body holding public spaces has not the same rights as a private owner has of putting up screens for the purpose of compelling adjacent owners to set back their buildings to a reasonable distance from the boundaries of the public space, instead of building right up thereto, as has been done in Paddington.

It was stated that the London School Board were taking steps to acquire the well-known Wycliffe Chapel and burial ground in Stepney for the purpose of erecting schools thereon, and it was agreed to oppose the proposal, as being contrary to the Disused Burial Ground and Open Spaces Acts. A letter was read from the London County Council agreeing to promote a Bill next Session for enabling Metropolitan Borough Councils to plant and maintain trees in thoroughfares.

It was announced that the laying out of Southfields Recreation Ground, Wandsworth, had been completed, and that the ground had been opened to the public, under the name of Coronation Gardens. It was stated in regard to the scheme for the extension of Hampstead Heath that the voluntary contributions now amounted to about £10,000. A further letter was read from the London County Council declining to contribute to the acquisition of St. Peter's Square, Hammersmith, a fine enclosure 1½ acre in extent, which is in danger of being built over, owing to the high price, £12,500, asked. It was considered that every effort ought to be made to prevent the obliteration of London Squares, and that the Council should be asked at what a price it would be prepared to assist.

The secretary stated that he had given evidence at a Local Government Board inquiry in favour of the preservation as a public space of the Norfolk Square area, situated in a very congested part of Islington, and that seats had been sent to grounds in Tottenham, Hanwell, and Dulwich, and to Turnham Green, as previously agreed; but that the association's seats had been removed by the Office of Works from Trafalgar Square, in reference to which Lord Meath was in communication with Lord Windsor. Proposals for securing West Square, Lambeth, an estate at Upper Clapton, churchyards in Newgate Street and Poplar, and for the preservation of the enclosure opposite St. Thomas' Hospital were under consideration.

### Newport (Mon.) Gardeners'.

The first paper of the session was read by Mr. J. Basham, jun., of Bassaleg, on October 14, the subject being "Hardy Fruit, Past and Present." Mr. Basham said where Oak, Ash, and Elm thrive, fruit trees will thrive also. He dealt with varieties grown 300 and 400 years ago, quoting largely from a work by Austin, printed 1629, some of the varieties being still in cultivation, such as the Cats-head Apple. The Old English Pearmain could be traced back to the twelfth century. Some names of varieties grown in the olden times were very amusing, such as Tender Chesnut Rattle, Cushion Hell, Our Ladies, Dewy St. John (of two sorts), Mother in Law, &c. The directions for the culture of fruit trees given in the old books would do very well for the present time. Messrs. Daniels, Bishop, Woodward, Wiggins, Bale and others took part in the discussion. Mr. Basham was accorded a very hearty vote of thanks for his able and interesting paper. The society's certificate of merit was awarded to Mr. J. Basham, and also to Mr. E. Basham for their splendid displays of Apples and Pears. Mr. J. Duff presided over a good attendance.—J. PEGLER, Hon. Sec.

### Ipswich Mutual Improvement.

At the last meeting of the above society, on October 15, a lantern lecture on "The Evolution of a Flower" was given by Mr. A. Martinelli, on the lines of the synopsis published with some appreciative comments on page 359 of your previous issue. Mr. R. C. Notcutt presided over a good attendance. For nearly an hour an interested audience followed the lecturer while he traced the development of the various types of plants found in successive geological strata, and their prototypes of the present day. Especially interesting were the slides showing the prevailing character of the vegetation during the carboniferous period; the fossil forest of Cycads, in the Jurassic system; likewise the tropical vegetation of the Tertiary (eocene) period. The society is fortunate in numbering amongst its members gentlemen having such scientific qualifications as Mr. Martinelli, especially as they are always ready to impart their knowledge for the benefit of their fellow members. At the close of the lecture a vote of thanks was proposed by Mr. Shipston, seconded by Mr. Messenger, and carried unanimously.—E. C.

THE GARDEN CITY ASSOCIATION IN THE HIGHLANDS.—An excellent opportunity now presents itself in Scotland by which the character of a Highland village might be preserved in the plans for the housing of some 300 workers in the employment of the British Aluminium Company at Foyers, Inverness-shire. This company is willing, subject to certain reasonable reservations, to give control of the buildings and development to a syndicate having these interests in view, and willing to accept a limited return of, say, 4 per cent. or 5 per cent. on its capital. Architects are invited to compete in designing plans of such dwellings, and all who are interested in preserving the beauty of the Highland scenery are asked to co-operate in this practical scheme. The Garden City Association has been approached as being an influential body interested in providing suitable and healthful dwellings for the people, and that organisation is prepared to consider and advise as to the mode of carrying out any scheme which may be decided upon, whereby, with the co-operation of the company, a village worthy of its exceptional surroundings may be established. The Garden City Association has also consented to receive any communications as under:—The Garden City Association, 347-351, Birkbeck Bank Chambers, Holborn, London, W.C.

### Fruit Forcing.

**CUCUMBERS.**—The autumn fruiters being in full bearing, must not be overcropped, but the plants will bear enormously if well supplied with nourishment. Examine the plants at least once a week for the removal of bad leaves and for stopping and cutting away the superfluous growths. Sweetened horse-droppings, sprinkled on the beds occasionally, act as a gentle excitant to the roots, supplying nourishment to the soil and ammonia to the atmosphere. Spare no effort to keep the foliage clean and healthy, and do not permit accumulations of dirt on the glass. Allow the winter fruiters to extend well up the trellis before stopping them; train the shoots right and left at about one foot distance apart. Earth the roots as they protrude from the hillocks or ridges; supply water as required, not less in temperature than that of the bed, being careful not to overwater or allow the plants to lack needful supplies of that element and liquid manure, or surface dressings of fertilisers washed in. Maintain a night temperature of 65deg to 70deg in mild weather, 60deg to 65deg when the nights are cold, 70deg to 75deg by day, artificially advancing to 80deg, 85deg, or 90deg with sun heat. Admit a little air at the top of the house whenever the weather is favourable, but avoid cold currents—indeed, it must be done without lowering the temperature or drying the air too much; and lose no opportunity of closing early in the afternoon on days when a little ventilation has been given in the early part of the day. On dull days little moisture will be required.

**PEACHES AND NECTARINES: EARLY FORCED TREES.**—Whether the varieties comprise Hale's Early, Stirling Castle, Royal George, Dymond, Grosse Mignonne, Goshawk, Bellegarde, and similar second early and midseason Peaches, along with Lord Napier, Stanwick Elruge, Elruge, Improved Downton, Dryden, Darwin, and other second early and midseason Nectarines, or consist of Alexander, Waterloo, Duchess of Cornwall, Amsden's June, and other very early Peaches, with Cardinal and Early Rivers Nectarines, the trees will have been at rest for some time, and having been pruned, dressed, and everything put into proper order, but little beyond keeping cool will be required until starting time.

**SUCCESSION HOUSES.**—The trees will be in various stages of maturing the foliage, according to the time of starting, but this must not be hurried by removing the leaves forcibly. If ripening tardily, admit air freely at night, keeping the house rather close in the early part of the day and maintaining a dry atmosphere. Seek gradual maturation, when the leaves will part freely from the trees.—**ST. ALBANS.**

### Kitchen Garden.

**POTATOES.**—Circumstances difficult of control may have prevented the lifting of the Potato crop in its entirety, but every opportunity should be taken during dry periods to lift the tubers out of the ground. If an unfavourable time is anticipated for drying them it will be best at this late period to spread the tubers out under cover, taking them there as soon as picked up. In order to economise space, select the best tubers out at once. A further selection will divide the tubers reserved for use from those suitable for seed. The former, immediately they are dry enough, may be stored in a dry, cool place where they are safe from frost and can be kept covered from the light. Conveniences differ, some storing them in heaps on the floor, while others will pack them in barrels or sacks. Where large quantities are grown, and the tubers can be fairly well dried, they may be clamped outdoors, covering the heap with a good layer of straw, and on this a liberal thickness of soil.

**SEED POTATOES** are readily dealt with. Place them in layers in shallow boxes, which may be stored on shelves in any structure, cool, but safe from frost. When handling the tubers look out for diseased ones.

**BEET.**—In lifting Beet the roots must be carefully handled, so as not to break the tap roots more than necessary. The leaves should be twisted off several inches from the crown. Cutting them will cause bleeding. Lay them out to dry for a day or two, and then store them in a cool shed between layers of dry ashes.

**TURNIPS.**—The autumn-sown crop should be thinned to the extent the plants require for forming good roots. Roots still developing may remain in the ground for winter use, to be pulled as required, but those fully grown may with advantage be lifted and stored under straw in a cool shed where they are handy to obtain in bad weather.

**CHICORY.**—This being a valuable salad plant, well-grown roots may be lifted as required. Cut off the tops just above the

crown, and pack them in pots or boxes, with soil between, and place the receptacles in a cellar where absolute darkness can be ensured. In three weeks growth will commence, and this may be used for salading.

**CELERY AND CELERIAC.**—The last earthings may be given to Celery plants constituting the late supply. Bring the ridge of soil well to a point, so as to throw off rain readily. A portion of the crop of Celeriac should be lifted and stored in sand. Remove the leaves except the central ones.

**CARROTS AND PARSNIPS.**—Fully-grown roots of Carrots may be lifted and stored. The leaves may be cut off close to the crowns. Dry ashes will preserve the roots well. For the sake of having roots conveniently at hand in unsuitable weather, a portion of the Parsnip crop may be lifted and stored in the same manner as Carrots. The bulk of the roots, however, are best left in the ground until wanted.

**OUTDOOR TOMATOES.**—Green fruits still hanging on the plants cannot by any possibility ripen, so they ought to be gathered and made into jam or pickled. Any with a tinge of colour in them, cut with a portion of stem, will colour further in a warm structure.

**CABBAGES.**—Cabbage plants may still be inserted, especially any that can be lifted with small balls of soil and roots from the seed beds. Dust soot or lime about the plants which are growing, to ward off the slugs, which may be abundant in damp weather. To further assist them, remove yellow leaves and keep the soil clear of weeds by hoeing. The latter operation is only practicable and advisable when the weather has dried the surface soil. When in a pasty condition, trampling upon the ground closes the pores of the soil and excludes air.—**EAST KENT.**

## Trade Notes.

Henry West, Bristol.

Mr. H. West, late head gardener at Bettisfield Park, Whitchurch, Salop, has gone into business as a nurseryman, seedsman, and florist, on his own account, at Cheltenham Road Nurseries, Stokes Croft, Bristol.

### Change of Address.

We are informed that "Chase's Beetle Poison," of recent years forwarded by Thomas Chase, of 151, Broad Street, Birmingham, having upon the death of Mrs. Chase, sen., been purchased by A. Chase, will now be supplied wholesale from 3, High View Terrace, West Norwood, London, S.E.

### Vaporite.

This is a new vapour process developed by Mr. G. F. Strawson. Vaporite gradually evolves a noxious vapour, which fills the interstices of soil, from which the insects cannot escape and are consequently destroyed. This (we are informed) is applicable to every kind of plant, grown under all conditions, whether in the field, the garden, or under glass. For field crops generally the application of 150lb to 200lb per statute acre should be sown broadcast and ploughed in and allowed to remain undisturbed. It is sold in bags by Strawsons, City Bank Buildings, 71a, Queen Victoria Street, London, E.C.

The weather has been dull, and a considerable quantity of rain has fallen during the week.

## THE BEE-KEEPER.

### Wintering.

The year 1903 is now closed, as far as the honey harvest is concerned. Would it not be well for us to consider what were the causes of failure or success of the year's working? Let us go back to the end of the honey harvest of 1902. Many of us, I fear, failed to do our duty, and trusted to good fortune favouring us in the spring of the present year—and what were the results? The weather was unfavourable and the stores ran out, and, most unfortunate of all, many of our best stocks died of starvation. Yet the fault was our own; we ought to have fed up the colonies well before September was out. Let us profit, then, at this late hour by our misfortunes of last season, and make such a catastrophe an impossibility.

Examine every stock, and if the bees cover six combs densely and each comb has an average of  $4\frac{1}{2}$  to 5lbs. of honey stored and sealed, we may rest contented; but if not, then we supply the deficiency by feeding with a good cake of candy. Next see that the hives are quite waterproof, for if the winter follow the example of the summer—and there is every sign of it—we shall have a very wet time of it. I know of nothing that is more hurtful to a colony of bees than dampness. The best remedy against leaky roofs is to cover with tin. A cheap method of doing this is to use tins, such as large cocoa tins, tack them as slaters do slates, and solder up the edges, and give them two coats of paint. With regard to the inside, place the candy over the centre frames, cover well with quilts, and leave the entrances only wide enough for one bee to pass through. Close up the dummy and pack the sides well with chaff.

**HOW TO MAKE CANDY.**—Remember, if each colony has from 25lbs to 30lbs of sealed stores, there is no need to feed with candy, for they will have quite sufficient to carry them over to May. Use a tin saucepan, and place in it 8lbs of the best granulated or white lump sugar and pour on it a pint of boiling water. Stir well, but do not allow the pan to touch the fire or you are almost sure to burn it—and burnt sugar is death to bees in the winter. When you have boiled it sufficiently—and a few minutes is usually sufficient—take it from the fire and stir well until it cools, and it will then be of a flaky nature.—HYBLA.

## Young Gardeners' Domain.

### Apprenticeship of a German Gardener.

First of all it is required of an aspirant to have a fair school education; if possible, language (Latin especially) and geography, which help him considerably, and save a lot of study in after days. If the young man has found a place to enter as an apprentice, the majority of establishments charge a certain sum per annum, Germany generally from 100 to 150 marks (84s. to 156s.); France and Belgium about the same. Then he must enter a contract to serve a time, generally three years. In rare cases he will be allowed a small compensation at the last year of his time.

There are some places which take apprentices without pay, but then he must generally serve a time of four years.

This time will never be forgotten by any young man who passed through it. It is a time of hard work, and not only long days of hard work—in many places it is compulsory to pass through evening school to collect knowledge in landscape drawing, geometry, and surveying. This goes through to sometimes three years during winter. Then besides at home it is not only practical work which occupies the young man, but also theoretical. There are the names of all the plants to be learned, their nature, native country, under what conditions they grow best, what soil is best for them; books have to be bought and studied; many employers require their apprentices to keep a daybook in which all work done during the day has to be entered. Not only superficial, but to the minutest details. After twenty-six years the writer recalls many instances of apparent negligence and the rather strong reprimands he received. In this way the time passes for the apprentice under constant work with few and long between pleasures. After the expiration of his time he is called an assistant, and receives his certificate, of which every young gardener is as proud as any young girl of a new Easter hat.

Then his time comes to travel. Of every young gardener it is expected that he sees other establishments, if possible other countries, and widen his knowledge. We all, who passed through the mill, know how proud we felt and thought we knew it all; but no matter how hard we worked and studied, after getting to a new place he finds out how little he really does know. Wherever he goes there are different methods, other plants,

always something new; so it keeps him hustling to keep up to date. It is a constant learning as long as he is in the profession. But this is a gardener.—R. W. UNGER (in "Union Gardener.")

The Editor acknowledges the receipt of some interesting letters, following his invitation given last week, and promises the publication of those that are noteworthy.

\* \* All correspondence relating to editorial matters should be directed to "THE EDITOR," 12, MITRE COURT CHAMBERS, FLEET STREET, LONDON, E.C. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense. In naming plants we only undertake to name species, or well-marked varieties, and only six on any one occasion. Florists' flowers we do not name.

**INSURANCE AGAINST LOSS AT SHOWS (W. L.).**—We presume you mean insurance against a wet day, or similar detractor. Try "Lloyd's."

**BOOKS (W. H.).**—Messrs. W. and H. Collingridge publish an Encyclopædia of Gardening. The price we do not know, but you could drop a postcard to Aldersgate Street, E.C., and enquire.

The Comma Butterfly.

### THE COMMA BUTTERFLY (Naturalist).

—We are quite unable to say whether this species of *Grapta* is found in numbers in Kent or Surrey. At one time it was quite absent from these counties, though prevalent in Worcester and Hereford, as well as elsewhere in the Midlands. It flies in October, and the caterpillars feed on the Hop a little before the time that the Hops are gathered. The butterfly, or imago, is very distinct in form.

**DEFINITION OF HARDY HERBACEOUS CUT FLOWERS (W. T.).**—The three Lilies you name—*Lilium speciosum album*, *L. s. rosea*, and *L. Harrisii*—are strictly herbaceous bulbous plants, as also are *Gladioli*. There is no reason why they should not be included in a collection of herbaceous cut flowers at local, or indeed any shows, except where separate classes are provided for such plants—say for Liliums and for Gladioli—separately in the schedules, and these so worded as to exclude their being shown as "cut" herbaceous plants. Indeed, herbaceous implies any plant not of a ligneous nature, whether bulbous, tuberous, or other kind of rootstock, evergreen or deciduous. Of course, when classes are provided in the schedules for particular plants or flowers, it is usual to disqualify such in collections of cut herbaceous, though this is not stated in the schedules, and often causes much needless bickering.

**REMOVING PLUM TREE (A. Boyle).**—You cannot adopt a better plan than the one you propose. In all probability the trees will have some roots approaching more or less a vertical position, and they must be severed, half of them this year and the other half the next. If you can place a quantity of light, gritty vegetable soil in the trench, packing it very firmly round the roots, it will be of great value in promoting the emission of a number of short fibrous roots that are so desirable for the quick re-establishment of the tree. It will be an advantage rather than otherwise to prune the tree by shortening the luxuriant branches.

**NAMES OF FRUITS.**—Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number. (J. P.).—Pear Doyenné du Comice; Apple Mannington Pearmain. (F. N.).—1, Allington; 2, Ecklinville; 3, Bismarck; 4, Ribston Pippin. (North Berwick).—1, Wealthy; 2, Gascoigne's Scarlet; 3, Margil; 4, Tower of Glammis. (Fanny Tait).—Grapes (1) Trebbiano and (2) Alicante.

**NAMES OF PLANTS.**—Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number. (T. L.).—1, *Aster horizontalis*; 2, *A. cordifolius*; 3, we do not name *Dahlias*. (F. T.).—1, *Polygonum molle*; 2, *P. orientale*; 3, *Dendrobium formosum giganteum*; 4, *Odontoglossum grande*; 5, *Cattleya Mantini*. (Orchidist).—1, *Lælio-Cattleya* × *Nysa*; 2, *Cattleya Wendlandiana*; 3, *Lycaste Skinneri alba*; 4, *C. Gaskelliana alba*; 5, *Tricopilia nobilis*.

**COMMUNICATIONS RECEIVED.**—C. J., W. R., F. W. C., H. F. M., J. S. U., C. H. P., R. & Co., Horticultural College, Swanley, A. F. M., F. P. R., H. S., H. D., L. S. W., J. V. & S., W. L., E. M., E. B., F. T., A. I., N. F. A., N. F. F., J. B., L. O. T.

## Weather Notes.

### The Continued Wet.

It is now October 19 and very little of the Corn crop is secured in this locality. For the last ten days rain has been general, and if a promising interval now and then insinuated itself, a recurrence of the prevailing conditions has summarily put a closure upon the rising hopes of stealing a few sheaves from the demon of the rainstorm. The state of matters at this moment is serious, and aged people say that the like has not taken place within the range of memory. The harvests of 1868, 1872, and 1879 were in a measure unpropitious; but in neither case was the persistency of the rain so great as in the present year. The wet nature of the harvest of 1872, personally, I shall never forget. That year is specially memorable to myself as being the one which rightly or wrongly destined me to become a sharer of the fortunes of a gardener, and as my first contact with "the noble art" was to assist in the drudgery of the culinary supply of a large establishment, I got all the rain that was going. My clothes, between fire drying and wet were, figuratively speaking, rotted on my back.

So much for my opinion of the year of my entry on graduation. The crops were very much destroyed with the wet, and late before being secured. The year 1879 was very much of a piece with the present one—uniformly of a low temperature (that is in the latitude of Edinburgh) where my observations were made. It is worthy of note to bear in mind that this year was immediately succeeded by the longest and severest winter on record, beginning on November 11, and breaking up on March 22, 1880. Doubtless the cold nature of the earth's temperature had much to do in bringing this phenomenon about.—D. C., Hamilton, N. B.

## These Autumn Days.

The autumn days are very well filled with work of one sort or another. The difficulty is not to find a job, but to get all jobs through that present themselves on every hand. The autumn work proper has been much delayed, and the delay has increased it. If we take October as the first month of a new agricultural year, which, we believe, is the proper thing to do, we shall speak, as does a well-known journal, of the legacy of weeds left by the last few months of the past year. Weeds everywhere! and with this soft, mild weather they are increasing on every hand.

There is one advantage about a dry time—weeds once out of the land will die without much effort on our part. To-day we saw great heaps of rubbish that had been carefully forked out and placed together, with a view to ultimate burning. There is no prospect of that, for those heaps are all "a-growing and a-blowing," and how they are going to be destroyed we do not quite see. The tiniest bit of twitch or couch-grass is as full of life as though it had never been treated to a turn of the harrow or scarifier. Some of the land that was got ready for Wheat-sowing is as green as good old pastures. There has been no such thing as eating down with stock: there is not stock enough to do it. Now is the time for those advocates of green crop manuring, but all land won't stand that treatment. It requires a big hole in which to bury all the green stuff of this year; and it is only on deep soils where the plough can penetrate low enough that this practice can be followed. And then, even then, twitch, though buried, is not of necessity dead. How some of the Wheat stubbles are going to be cleared we hardly know. We should welcome a high wind and a drying sun, and that not for one day, but for many.

Numerous farmers will be turning their attention to the preparation for sowing of Vetches, one of the most valuable fodder crops known, and, unlike Lucerne and Trifolium, will appear to flourish north, south, east and west. We have heard of fourteen tons per acre on the borders; but we should feel satisfied with less. Stubbles must be well broken up and all weeds removed, a process that cannot fail of making the soil friable. There must be a contribution, and

a heavy one, from the fold-yard, in the shape of well-rotted manure. It must be remembered that a heavy crop is expected, therefore it must be well fed: this must be ploughed in, and then the land is ready for sowing. In sowing Tares or Vetches, it must be borne in mind that, should the winter be a severe one, some plants will probably perish; hence it is of importance to put on plenty of seed, say three bushels to the acre: to this add one bushel of winter Oats. On really good soil, generously treated, the crop will be fit to cut by the second week in May, or perhaps even earlier.

As a rule in May, green keep is not very abundant, and therefore the Tare crop is of immense value. There is no stock on a farm which will not eat Tares with avidity, and also with great benefit to themselves. Tares are eminently suited for horse-feeding, in shed or stall; and they greatly improve the quality of milk, i.e., add to its butter-fat. We are not sure whether, during exceedingly hot weather, cows are not as well kept in their byre during the day and turned out to graze at night; and they will pass their time profitably indoors if supplied with Tares and plenty of water. They will enjoy their nights out and benefit much more from the grass than they possibly could do under a blazing sky.

We have most of us experienced the difficulties of "finishing off" what ought to be fat stock in the early summer months. Roots are done, and grass far from abundant (grass has a way of running off when least expected); and hand food alone is too expensive. A little hand food, however (cake and crushed corn), with liberal rations of Tares, will bring beasts to that point of perfection that the butcher desires. It is possible—easily possible—with good management to get bumper crops, and the farmer should not be satisfied unless he gets out of the land up to the last ounce.

We used the word "management" a line or two back. Now, to a Yorkshireman's mind that would convey a rather different idea than to the outsider. The old-fashioned, old-world farmer, when he spoke of management, meant "muck"; and really, perhaps he was right; in this case certainly, for muck seems to be the great factor for success.

#### Rural Districts and Milk Supply.

We have met with an indictment against the rural districts. We have touched on the subject before, but it looms largely before us again—the country districts are supposed to be superior to the towns on account of the fresher air, fresh milk, fresh eggs. The air is still in its pristine purity; but milk is often terribly scarce. There are good dairy cows in every pasture; plenty of milk is produced, but it is not for home consumption. There is such a call from the towns for milk that they literally drain the country. The milk is cooled in the sheds, canned, and sent off to the nearest station, and little or none is left at home. We know many farmers who never make a pound of butter, and who, if an extra supply of cream is needed in the house, have to procure it from some small dairy, where the quantity of milk produced is not sufficient to be worth sending far afield. Unfortunately these small people are rather, if anything, on the decrease; or the little they have of milk is converted into butter.

We always rather run into extremes. There was a time when all milk was utilised at home: there is a time (the present) when the idea seems to hold that it is best to send all away, and the farther off the better! This falls very hard on the villager, other than the farmer, and really many country children get less milk than their town relatives. Many farmers will let their own men have milk on easy terms, and this is as it should be; but what of those households that are not immediately connected with the farms? Some idea of the growth of the milk traffic will be arrived at when we quote some facts given at the Frome agricultural dinner a fortnight ago, by the Marquis of Bath. He instanced one station, that of Frome. In 1892 the export (if we may so express it) of milk was 161,791 gallons; in 1903 the export was 734,586 gallons. What makes this more remarkable is that Frome is the centre of a large cheese-making district, and we do not hear there is any serious diminution in the cheese output.

Somerset, as some people may know, has a school for cheese-making in connection with the Bath and West of England Counties Society, under the immediate management of the C.C. The school is at Manor Farm, Woolston, and the second draft of cheese (74cwts) has just been sold at 65s. per cwt of 112lbs. The milk used was 8,875 gallons, and the green cheese amounted to 8,903lbs. When sold at the end of fourteen weeks, there was a shrinkage of nearly seven per cent. We have often wondered that more girls do not study for cheese-making, as the field is not so well stocked as

that of dairy work (ordinary). There is certainly only employment during the summer months, but the pay is good; and as the summer work is arduous, the cheese-maker is not averse to the winter's rest.

#### The London Dairy Show.

The Dairy Show at the Agricultural Hall is again a thing of the past. Its popularity does not decrease, and our own opinion is that this show is, perhaps, from a practical point of view, the most useful of any agricultural exhibition. It is a sign of winter when we read that entries for the Smithfield Fat Stock Show will close in about ten days: truly, the seasons do succeed one another with great rapidity.

Those of us who are milk producers will either have made or be just on the point of making, contracts for the whole of one winter delivery. Happily, most of us are well fixed in the matter of hay, roots, and straw for bedding. We fancy a good deal of home-grown corn will never see the market except in the forms of milk and beef. How far this is a wise policy is a matter of argument in every class paper one takes up. We know it is very often the case that the home stock is made to eat up what is little better than rubbish: the idea seems to be rather filling than feeding; and the digestive organs are sadly overloaded and overworked without any proportionate benefit. We have heard of cats and dogs being spoken of as sanitary dustbins; and we greatly suspect if our horses and bullocks had the gift of speech they could tell of many unsatisfactory rations of fusty hay and corn that was all husk or sprout!

#### Work on the Home Farm.

Deluge upon deluge! Two fine days out of seven, and on those threshing was the only thing possible. Such is the record of another week. October is fast passing away, and no October work is done. Happily, we have no corn out, but how hapless is the case of those unfortunates who have. We had not to leave home very far the other day to see Oats standing green, in sheets of water, and sheaves floating about. Whole districts of Potatoes are under water and practically worthless, and very few have yet been lifted. It is not pleasant either to write or think of.

Recent threshings have been more unsatisfactory than ever. The sides of stacks have no chance to get dry, and the condition of the grain is worse than it was when stacked. Wheat is as bad as Barley, and very little of it is dry enough for seed purposes. We urge our friends to procure dry seed if possible; the seed bed must be a wet one now, and damp seed will be more likely to swell and burst than germinate. We fear much Barley is heated in the stacks. Barley stacks have dropped in height in a very ominous manner. We have seen one sample of Barley at 34s., and another at 16s., grown in an adjacent field, but badly got and heated. Good Barley must pay for keeping, if the owner can hold it.

There has been a little occupation for the men in the granary, dressing and weighing up Wheat. There has also been some work at opening grips and letting surface water into the dikes. The land is so sodden, and the rainfall so heavy, that the water could not possibly get away by drainage in the ordinary way.

Sheep have been very uncomfortable on Turnips, even on fairly dry land, and they have been changed to grass, of which there is too much. Fat cattle are doing no good even with cake, and would be better up; but it is not yet convenient to find the labour needed for stall-feeding. The reared calves—in fact, all those under twelve months—are now up at night and eating hay; the grass now is not suitable food for young things, as a sole diet.

Potato disease has had the expected effect on the pig market. All store pigs of any age or size are dearer, and the supplies of pork have decreased sufficiently to raise the price of small weight to 6d. per lb. Although it has been warm enough, the wet has been bad for laying hens, and the fresh egg supply is almost nil.

The breeding ewes are on new seeds, as we have no rape for them, but the seeds are full of good meat, and there are a few ears of Barley to be picked up. We saw some pigs being tented in a field quite lately:—a rare sight, nowadays, but especially in October.

**PROLIFIC FARROWING.**—Cases of prolific farrowing are reported from time to time, but an experience of Mr. J. E. B. Cowper, Gogar House, Edinburgh, in the pig-rearing line will be hard to beat. Last week, Mr. Cowper had a cross-bred large Yorkshire sow which gave birth to no fewer than twenty-one pigs. The pigs were all born alive, and although naturally not of the biggest class, were all healthy looking and vigorous. It is quite expected that the bulk of them, with a little artificial help in nursing, will be easily brought on to the stage when they can find for themselves. On the following morning Mr. Cowper had another sow which farrowed fourteen pigs, both litters being by a pure-bred large Yorkshire boar.

## Rose Analysis 1896-1903.

THE demand for Roses is increasing so rapidly every year that any trustworthy guide to the selection of varieties for various purposes must always be welcome at this season. To the novice, the number of sorts described in the trade catalogues as worthy of his attention cannot but make the choice of varieties more or less bewildering. Added to this, Roses are divided into so many different sections, concerning the distinctive characteristics of which he can have but little, if any, knowledge, that the matter of selection is rendered still more puzzling. To those who have a fair knowledge of Rose culture such a guide cannot fail to be helpful and, at the same time, interesting. Truth to tell, even the expert rosarian has his own special difficulties in selecting, for it is almost impossible in the present day to keep in touch with more than a limited number of the hundreds of varieties now in cultivation, and to understand all their "manners and customs" and the purposes for which they are best adapted.

As regards the present analysis and those of a similar character which have, in years gone by, preceded it, the idea has always been to base the results obtained upon facts rather than upon opinions—or, I should say, upon the opinions of exhibitors as demonstrated by their actions. With this object, for the last seventeen years, the name of every Rose in the first, second and third prize stands has been taken down at the leading Rose show of the season. By the leading Rose show of the year I, of course, mean that held by the National Rose Society for many years at the Crystal Palace and for the last three years in the Temple Gardens. The results thus obtained are afterwards tabulated, and the varieties arranged in the accompanying tables

As regards the present analysis and those of a similar character which have, in years gone by, preceded it, the idea has always been to base the results obtained upon facts rather than upon opinions—or, I should say, upon the opinions of exhibitors as demonstrated by their actions. With this object, for the last seventeen years, the name of every Rose in the first, second and third prize stands has been taken down at the leading Rose show of the season. By the leading Rose show of the year I, of course, mean that held by the National Rose Society for many years at the Crystal Palace and for the last three years in the Temple Gardens. The results thus obtained are afterwards tabulated, and the varieties arranged in the accompanying tables

READERS are requested to send notices of Gardening Appointments or Notes of Horticultural Interest, intimations of Meetings, Queries, and all Articles for Publication, officially to "THE EDITOR," at 12, Mitre Court Chambers, Fleet Street, London, E.C., and to no other person and to no other address.

according to the average number of times each Rose was staged at the last eight metropolitan exhibitions of the Society. This applies to rather more than two-thirds of the varieties which find places in those tables.

For the sorts of more recent introduction the longest trustworthy averages obtainable are given them instead. The still newer kinds are further dealt with in a special audit,

the results of which are given at the close of that part of this article which has reference to Roses for exhibition purposes. After this audit will be found carefully compiled lists of the best Roses in all sections for cultivation.

The Rose season of 1903, like that of the previous year, proved an extremely backward one, and as the date of the National Show was again unusually early the later flowering

\* New varieties, whose positions are dependent on their records for the 1903 show only.

Roses were consequently placed in both years at a great disadvantage as compared with those which come into bloom earlier in the summer. Fortunately, however, for our present purpose, the number of early and late seasons were almost equally divided in the eight years covered by this analysis.

It will be noticed that Bessie Brown still maintains the lead it secured last year over Mrs. John Laing—which variety had previously held the premier position in the table of Hybrid Perpetuals and Hybrid Teas for ten consecutive years. This is, I think, to be regretted, for Mrs. John Laing is not only a grand exhibition Rose, but also an equally dependable variety for ordinary garden cultivation. Bessie Brown, on the other hand, although unsurpassed for exhibition purposes, is so excessively modest that she is almost invariably to be seen with her head bent, instead of holding it erect, as any well-conducted "garden" Rose should do. The positions of the leading four varieties remain as in the previous analysis. In fact, with the exception of Marquise Litta and Gustave Piganeau, both of which have risen two places, there are no changes worth mentioning in the first twelve sorts.

Of the established kinds, Marquise Litta has never before in the last eight years been as frequently shown as it was this year, and in the same period La France, Madame Gabriel Luizet, White Lady, and Prince Arthur only once before. On the other hand, A. K. Williams, Captain Hayward, Earl of Dufferin, and Etienne Levet have in no previous year been as indifferently represented, while the records for Her Majesty, Marie Baumann, Alfred Colomb and Dupuy Jamain are almost equally poor. The above results were, no doubt, principally brought about by the backward season favouring the early to the disadvantage of the late flowering kinds. Judging by the last two exhibitions of the Society the best Roses for an exhibitor to grow in a backward district for the early shows would be the following:—Caroline Testout, Marquise Litta, Mrs. W. J. Grant, Kaiserin Augusta Victoria, La France, Madame Gabriel Luizet, White Lady, Helen Keller and Prince Arthur.

The gradual decline of the crimson H.P.'s in our exhibition stands in recent years is much to be deplored, as most of them are not only splendid examples in themselves, but also serve to brighten up and enhance the beauty of their less florid neighbours. We have only to compare the analysis issued five years ago with the present one in order to see how marked this decline has been, even during that short period. In fact, only Captain Hayward, Horace Vernet, Prince Arthur, Général Jacqueminot, Comte de Raimbaud, and Xavier Olibo now occupy as good positions as they did in 1898, whereas Ulrich Brunner has lost two places, A. K. Williams seven places, Marie Baumann eight places, Alfred Colomb eight places, Charles Lefebvre ten places, Earl of Dufferin eleven places, Dupuy Jamain four places, Etienne Levet twelve places, Fisher Holmes twelve places, Duke of Wellington eight places, and so on throughout the list.

At exhibitions there may be some reason for this revolt against the H.P.'s, but it becomes altogether unmeaning when applied to our gardens. They may not be, as a rule, such good bedding Roses as the Hybrid Teas, but they are altogether indispensable for other purposes. For instance, in my own garden I should have had no Roses worth looking at during the greater part of the present wet autumn, but for these grand crimson and dark crimson Hybrid Perpetuals. Then, again, how few Hybrid Teas can compare in fragrance with Ulrich Brunner, A. K. Williams, Marie Baumann, Alfred Colomb, Charles Lefebvre, Earl of Dufferin, Général Jacqueminot, Dr. Andry, E. Y. Teas, Louis Van Houtte, or Maurice Bernardin?

#### The Advance of the Hybrid Teas.

On the other hand, the advance of the Hybrid Teas has been equally pronounced during the same five years. For example, in the 1898 analysis there were only nine Hybrid Teas on the list; now there are exactly double that number, besides which the following varieties with places in this year's analysis: Bessie Brown, Mildred Grant, Killarney, Countess of Caledon, Souvenir du President Carnot, Madame Cadeau-Ramey, Exquisite, Papa Lambert, Gladys Harkness, Mamie and Robert Scott, are not to be found at all in the list for 1898. There are many charming pink, rose, and creamy white varieties among these new H.T.'s, but, alas! no crimson, with the single exception of Exquisite, which only finds a place at No. 60.

No fewer than eleven new Roses—varieties sent out during the last five years—will be found in the table. The only 1898 variety is Killarney (No. 30), which occupies about the same position as in the previous analysis. Would that we had many more such Roses—Roses which are good for exhibition, and, at the same time, even more indispensable in the garden. Five new sorts are placed to the credit of 1899. Bessie Brown, which, as before stated, for the second time in succession heads the list of Hybrid Perpetuals and Hybrid Teas.

Next comes Ulster (No. 22), which has risen three places. Then lower down we reach the handsome Exquisite (No. 60), which makes its appearance for the first time in the table. Then Mrs. Cocker, also at No. 60, which has fallen fourteen places, and lastly Papa Lambert (No. 65), which has not improved upon its last year's position. Of the varieties distributed in 1900, Frau Karl Druschki, although new to the analysis, takes up a position at No. 17. This is in itself a remarkable performance for any new Rose, and only shows what a general favourite with exhibitors this beautiful pure white H.P. has already become. Years ago we had to be content with Madame Lacharme, which came out as a white H.P. in 1873, and since then we have welcomed in turn Mabel Morrison (1878), Violette Bouyer (1881), Merveille de Lyon (1882), White Baroness (1888), Margaret Dickson (1891), and Marchioness of Londonderry (1893), but none nearly as warmly as we now welcome this sterling acquisition—Frau Karl Druschki.

In the first place it is pure white, which none of its predecessors can lay claim to be, added to which it has a good, vigorous habit, and is moreover one of the freest flowering, if not the most continuous flowering, of all the Hybrid Perpetuals. The raiser of this remarkable Rose—and all honour be to him—is Peter Lambert, of Trier, in Germany. Gladys Harkness, the other variety of the same year, will be found at No. 66. The remaining new kinds are Mildred Grant, Mamie, and Robert Scott, which were sent out the year before last. Mildred Grant, ivory white in colour, is one of the largest exhibition Roses, if not the largest, in cultivation. Its popularity with exhibitors is already assured. It has performed the same feat as Frau Karl Druschki in rising at once to No. 17 on the list. At present it has shown itself but a moderate grower.

Mamie and Robert Scott, on their first appearance, take up places at the end of the list. Of the above new varieties Frau Karl Druschki and Papa Lambert came to us from Germany, while the remaining nine are of British origin, no fewer than seven of them having been sent out by one firm alone—Messrs. A. Dickson and Sons, of Newtownards, in Ireland.

#### Teas and Noisettes. (Table on next page.)

If we next direct our attention to the table of Teas and Noisettes we shall at once see what a disastrous year the past one has been for the Roses in this charming section. In fact, the season appears to have especially favoured only three varieties on the list, viz., Medea, Cleopatra, and Anna Olivier. As regards Medea, it was to be seen in nearly every stand. In previous years its records have varied from 14 to 27, but at the last exhibition it was staged no fewer than forty-seven times, or rather more frequently than any other Rose in the show; while Cleopatra (No. 18) and Anna Olivier (No. 22) have never before been as largely shown.

Nearly all the other Teas were more or less indifferently represented. Maman Cochet still stands at the head of the table, but has never before been as sparsely exhibited, and the same may be said of White Maman Cochet, while such old and tried favourites as Catherine Mermet, The Bride, Comtesse de Nadaillac, Bridesmaid, Madame de Watteville and Maréchal Niel have at no previous exhibition appeared in as few stands, even if we go back for fourteen, and in some cases even seventeen years.

There are four Teas on the list which were sent out during the last six years, and consequently may be regarded as new varieties. That grand lemon-white sport from Maman Cochet, White Maman Cochet, is the sole representative of 1897. It was placed second on the list last year, but now stands at No. 3. There can be little doubt, however, that in the next analysis it will be found to have regained its former position. Mrs. Edward Mawley, which was distributed in 1899, still remains at No. 5, and appears to be as great a favourite as ever.

We now come to two new yellow, or rather orange coloured T.'s and N.'s, both of which came out in 1902. The first of these, Souvenir de Pierre Notting, secures a place on its first appearance at No. 28, while the other, Lady Roberts,

also a new-comer, will be found at No. 32. We all know how limited are the number of good yellow exhibition Roses, and therefore, as we rejoice in the fine form this year of the

pale yellow Medea, so shall we watch with keen interest the future progress of these two new candidates for honours. Our next section is the garden Roses.

### TEAS AND NOISETTES.

Position in Present Analysis.	Average Number of Times Shown.	No. of Times Shown in 1903 in True Relative Proportion to the Average.	Name.	Date of Introduction.	Raiser's or Introducer's Name.	Colour.

31	6.4	7	Madame Bravy .....	1848	Guillot .....	White, flushed pink
*32	5.0	5	Lady Roberts .....	1902	F. Cant & Co. ....	Rich apricot

\* New varieties, whose positions are dependent on their records for the 1903 shows only.

### "Garden" or Decorative Roses.

See table on opposite page.

It may, perhaps, be advisable to explain once more that by "garden" Roses is meant those varieties which are either not sufficiently large or not sufficiently regular in form to allow of the individual blooms being set up singly at shows in boxes—like the Roses with which we have previously been dealing. These garden or decorative Roses, instead of being staged separately like the exhibition varieties, are displayed in large bunches, and the stands containing them now form some of the most interesting and attractive features of our modern Rose shows. In the following table the varieties are arranged according to the average number of times they were staged in prizewinning stands at the last four Metropolitan exhibitions of the National Rose Society, and no Rose has been included which has not been exhibited at one or other of those shows three or more times.

In the new class for summer flowering Roses at the last two exhibitions the following old-fashioned garden Roses were shown. A list of these may prove of interest to some of your readers, as among them will be found varieties which are now very seldom seen. I append a list of some of the oldest of these: Amadis (Boursault), Blairii No. 2 (H.B.), Celestial (Alba), Commandant Beaurepaire (Gallica), Comtesse de Murinais (Moss), Crested Moss (Moss), Coupe d'Hébé (H.N.), De Meaux (Provence), Dometil Beccard (Provence), Double Yellow (Scotch), Flora (Evergreen), Hebe's Lip (Sweet Briar), Julie de Mersent (Moss), Juno (H.C.), Ma Surprise (Microphylla), Madame D'Arblay (Musk), Old Black Moss (Moss), Perle d'Angers (Boursault), Prolific (Moss), Reine Blanche (Moss), Tuscany (Gallica).

I have again to thank those kind friends who year after year, on a busy show day, have assisted me in taking down the

names of the Roses in the prize stands, and have thus rendered these analyses possible.

### An Audit of the Newer Exhibition Roses.

The audit given below has been introduced for the benefit of the varieties of recent introduction, which it is impossible to place accurately in the tables, owing to their limited records, and to the disturbing influence of a single favourable, or unfavourable, season upon those records. Each of the following voters was requested to place the fourteen H.P.'s and H.T.'s on the audit paper in what they considered their order of merit as exhibition Roses, and to deal in the same way with the Teas.

In calculating the number of votes, it should be understood that a first place vote in the case of the former list is counted as fourteen votes, a second as thirteen votes, and so on. In the case of the Teas a first place vote is only reckoned as three votes, a second as two votes, and a third as one vote, as there are only three candidates on that list, as compared with fourteen in the other one.

AMATEURS.—Mr. J. Bateman, Rev. H. B. Biron, Mr. W. Boyes, Rev. F. R. Burnside, Rev. A. Foster-Melliar, Dr. J. C. Hall, Mr. R. Foley Hobbs, Mr. Conway Jones, Mr. H. V. Machin, Mr. O. G. Orpen, Rev. F. Page-Roberts, Rev. J. H. Pemberton, Mr. A. Slaughter, Mr. A. Tate and Mr. R. E. West.

NURSEYMEN.—Messrs. G. Burch, J. Burrell, C. E. Cant, Frank Cant, A. Dickson, Hugh Dickson, John Green (Hobbies, Ltd.), W. J. Jefferies, J. R. Mattock, H. Merryweather, jun., G. Mount, G. Paul, W. Paul, W. D. Prior, J. Townsend and A. Turner.

Special Audit of the Newer H.P.'s and H.T.'s.

Position in Audit.	Name.	Total No. of Votes.	Votes by Amateurs.	Votes by Nurserymen
1	Mildred Grant (1901), H.T.....	391	188	203
2	Bessie Brown (1899), H.T.....	367	174	193
3	Frau Karl Druschki (1900).....	339	159	180
4	Florence Pemberton (1902), H.T. ....	273	124	149
5	Alice Lindsell (1902), H.T. ....	257	116	141
6	Ulster (1899) .....	223	93	130
7	Duchess of Portland (1901), H.T.....	220	100	120
8	Papa Lambert (1899), H.T. ....	211	88	123
9	Ben Cant (1902).....	210	114	96
10	Gladys Harkness (1900), H.T. ....	178	79	99
11	Lady Moyra Beauclerc (1901), H.T...	173	72	101
12	Mrs. Cocker (1899) .....	162	70	92
13	Edith Dombrain (1902), H.T. ....	149	70	79
13	Mamie (1901), H.T. ....	149	74	75

Teas.

1	Mrs. Edward Mawley (1899) .....	88	45	43
2	Souvenir de Pierre Notting (1902)....	57	28	29
3	Lady Roberts (1902) .....	37	17	20

Placed according to their dates of introduction, the above varieties arrange themselves as follows: *Hybrid Perpetuals and Hybrid Teas*—1899, Bessie Brown, Ulster, Papa Lambert, Mrs. Cocker; 1900, Frau Karl Druschki, Gladys Harkness; 1901, Mildred Grant, Duchess of Portland, Lady Moyra Beauclerc, Mamie; 1902, Florence Pemberton, Alice Lindsell, Ben Cant, Edith Dombrain. *Teas*—1899, Mrs. Edward Mawley; 1902, Souvenir de Pierre Notting, Lady Roberts.

Roses for General Cultivation.

The following lists have been drawn up with a view to assist those who have but little knowledge of the different kinds of Roses in making a selection for their own garden. All the established varieties are arranged under the various headings, according to their order of merit, so that however small the number of Roses required may be, a satisfactory choice can readily be made. The varieties marked with an asterisk are either quite new or of recent introduction.

Exhibition Roses, that are also Good Garden Roses.

**HYBRID PERPETUALS.**—*White*: Frau Karl Druschki\*. *Pink*: Mrs. John Laing, Mrs. R. G. Sharman-Crawford. *Crimson*: Ulrich Brunner, Fisher Holmes, Alfred Colomb, Captain Hayward. *Rose*: Suzanne M. Rodocanachi. *Dark Crimson*: Prince Arthur, Prince C. de Rohan, Charles Lefebvre, Ben Cant\*. **HYBRID TEAS.**—*White*: Kaiserin Augusta Victoria. *Pink*: La France, Caroline Testout. *Carmine Rose*: Marquise Litta. **TEAS.**—*White*: White Maman Cochet, Souvenir de S. A. Prince. *Pink*: Maman Cochet, Souvenir d'un Ami, Mrs. E. Mawley\*. *Yellow*: Marie Van Houtte, Madame Hoste, Souvenir de Pierre Notting\*.

Garden or Decorative Roses Only.

**SUMMER FLOWERING**—**PROVENCE.**—*Pink*: Common Moss. *Pink*: Common. *White*: Blanche Moreau. **DAMASK.**—*Striped*: Rosa Mundi, Austrian Briar. *Coppery Red*: Austrian Copper. *Yellow*: Austrian Yellow, Harrisoni. **HYBRID SWEET BRIARS.**—*Coppery Yellow*: Lady Penzance. *White, tipped Crimson*: Janet's Pride. *Crimson*: Jeannie Deans. **CLIMBING ROSES.**—*White*: Bennett's Seedling (Ayrshire), Félicité Perpétue (Evergreen), Rosa-moschata, Himalaica (single). *Blush*: The Garland (H. China). *Crimson*: Crimson Rambler (Cl. Polyantha). *Carmine*: Carmine Pillar (single). *Yellow*: Claire Jacquier (Cl. Polyantha). **AUTUMN FLOWERING.**—**HYBRID TEAS.**—*White*, Souvenir du President Carnot, L'Innocence. *Blush*: Viscountess Folke-

GARDEN AND DECORATIVE ROSES.

Position in Present Analysis.	Average number of times shown in the four years.	No. of times shown in 1903.	Name.	Date of Introduction.	Colour.

## East Burnham Park, Bucks.

The county of Bucks is celebrated for its many historical, interesting, and beautiful homes, and amongst them is the above, the home of Mr. and Mrs. Harry J. Veitch. It is not far removed from the world-famed forest of Burnham Beeches on the one hand, and, on the other, the equally well-known home of the Fortescues. We allude to Dropmore, horticulturally famed for its magnificent collection of coniferous and other trees, as well as by the charm and character of the gardener who planted them—Phillip Frost, now no more.

The occasion of our visit, on the 29th July, was a pleasant one namely, the holding of the Farnham Royal, East Burnham, and Hedgerley flower shows. This is a pleasant amalgamation and joint exhibition, held first in one parish and then in the other. This year Mr. Harry J. Veitch was the host and president, and it need scarcely be said that nothing was left undone that could possibly have been done towards making the show a great success and the attendance of the visitors pleasant.

We have had the privilege of visiting East Burnham Park on many occasions since the property has been acquired by Mr. Veitch, and have witnessed with pleasure the great improvements he has year by year effected in the garden; an entirely out-of-door garden, he it remarked. For several years it was an uphill battle he had to wage against conditions inimical to good gardening, namely, a light, shallow soil, resting on a bed of gravel of great depth. Added to this, the summers on the whole have been dry and hot, especially the three previous to 1902, so that successful results of extensive planting under such conditions have been most difficult of attainment, but thanks to perseverance with the water-cart, mulching, and other means taken to lessen the evils of drought, the trees were kept in healthful growth, and now, through the influence of the greater rainfall and a moister atmosphere of last year and this, the various new plantations have made remarkable progress; so much so, that thinning out must before long be attended to.

In a garden so full of various and interesting aspects as this is, representing and embodying, as it does in a great measure, the life experience of one of England's foremost horticulturists, it is difficult to say what to admire the most. Here is the long expanse of well kept and beautiful lawn extending from the house well into the park beyond, judiciously, but not overplanted with the choicest and best of hardy flowers, trees, and shrubs. The Rose garden, where Roses are planted in masses of one colour in beds, and grown on lofty pillars, and arranged in many other artistic ways. The Rhododendron garden, planted in the same way. The beautiful ornamental lake, with its margins so attractively planted, and the water furnished with many plants of the new charming hybrid coloured Water Lilies.

The new pergola, with its old-fashioned tiled floor and pillars of rough materials, already mostly covered with climbing plants and Roses in great profusion, runs parallel with the pergola. A beautiful sunk garden of Roses has been formed, where Roses of every sort and description have been planted and are allowed to grow naturally at their sweet will and pleasure. Or, again, the semi-wild woodland and the valley and bog garden. Each has charms distinct from the other, and the whole together go to make one of the most interesting, beautiful and restful of out-of-door gardens we have recently seen.—Q.

*Phalænopsis intermedia* Portei.

Though still rare, this beautiful Orchid has been known to fanciers for many years, and is sometimes shown in excellent condition. It is described in Williams' "Orchid Album" as follows:—"This beautiful plant, which is very rare, is not unlikely to be a natural hybrid, and if so we should suppose it to be a cross between *P. rosea* and *P. amabilis*; let it, however, be hybrid or species, it ranks among the very handsomest of its class. In general habit it resembles *P. grandiflora*, the leaves being broad oblong acute, about 1 foot in length, the upper side dark green, the under side dark purplish, more in the way of *P. amabilis*. The spikes are arched and branched, supporting the numerous large flowers. In one form the oblong sepals and rhomboid petals are white, suffused with light rose at the base, the lip rich dark purplish rose, with the lateral lobes bluntly wedge-shaped, rosy, the base of the front lobe tinted with orange-yellow, and the disc and callus yellow, the latter marked with deep purple spots. The flowers are of good substance, and remain in perfection a very long time."

### The Week's Cultural Notes.

*Masdevallia towarensis*, now advancing for flower, is a most useful and beautiful species for cutting; and in order to see the flowers at their best, the plants should now be given rather more warmth than the coolest house affords. They will open more freely, and be of a purer white. Wherever the flower spikes are left on, these produce blossoms again next season, but this, of course, necessitates the wiring of the individual flowers when cut. But if the stems and all are removed there will generally be plenty more produced, as it is very free in this respect. The flowers may, if needed, be left upon the plants until they fade without injury to the latter; and as several spikes, containing each three or four flowers of the purest white, are produced on quite small plants, a dozen or two good specimens will make a very fine display.

*Cypripedium Spicerianum* is one of the finest flowers of the week, and it is now quite a success under cultivation. Good culture is needed, as it abhors anything decaying about its roots, though liking a sound, substantial compost of good fibry loam, sphagnum (chopped), and broken crocks. The proper time to repot is just as the flowers are past, young roots being then freely produced. While in flower, it should not be placed about in cold, dry houses, or rooms, nor should the roots be stinted for water at any time.

Among the taller growing *Cattleyas*, *C. bicolor* is one that deserves more consideration, on account of its very distinct appearance. It is easily grown, and looks grand, with the bright crimson of the lip forming a pretty contrast to the dull brownish tint on the outer segments. This will now rest for a time, as will most of the similarly-habited species; also *Laelia elegans*, *L. Boothiana*, *Cattleya crispa*, and others. The lovely *C. superba* I have noticed in flower this week. It likes more heat than any other *Cattleya*, but even it must have rest, and now is the time to rest it. Keep it dormant now and onwards; then in spring it will start strongly and well, producing strong flowering growths.

Although *Cattleya Trianae* and *C. Percivaliana* are at rest, these must not be overdried, as though no signs of life can be seen, the flowers are forming in the sheath, and any excess of dryness will weaken them. *C. Mossiae* should be finished by now, and must be kept on the dry side, well up to the light. The atmosphere of the *Cattleya* house must be kept rather drier, and whenever a few hours can be spared, cleaning operations may be carried out. The white scales so troublesome to these lovely Orchids must be searched for and destroyed, especially about the rhizomes and the sheathing base of the bulbs.—H. R. R.

### Notes on Vandas.

There are few genera of Orchids more beautiful than *Vandas*, and one wonders why they are not more grown. The tall-growing varieties and species, it is true, need a good deal of room, more than some cultivators can spare them; but there are a number of almost equally beautiful small sorts. Natives principally of the mainland and islands about Malay and India, most of them require tropical treatment, though in the past no doubt many fine plants have been ruined by too much heat. As a genus, however, they cannot be collectively treated, and a few notes on the best-known species should prove useful.

The propagation of most of them is comparatively easy, as nearly all throw side breaks that may be taken off and potted separately, so soon as they commence rooting. In one instance, *V. teres*, the plant may be cut up very freely, inserting the

cuttings in pots, or in a sphagnum bed over warmth, while the tops of nearly all the tall growers may be taken off occasionally and rooted. The parent plant soon breaks into fresh growth. All like plenty of sunlight, though, of course, blinds have to be used to break the full force of its rays in summer.—H.

## Single-handed.

"Where is So-and-So now?" "I hardly know, but I fancy he is in a single-handed place somewhere."

More than once I have heard the above question asked and answer given in gardening circles, and from the very tone of the reply you may gather that it refers to a horticultural failure, whole or partial. Fallen to a single-handed place! This has been the lot of many a man who has belonged to what I might call the upper circle of head gardeners who control pretentious establishments. They drop out of the ranks, so to speak, through some cause or other, for which they may or may not be responsible, and in their changed position, down on one of the lower staves of the ladder, their former friends speak of them, generally kindly and sympathetically, but only as single-handed gardeners. It is the way of the world; some go up, others come down, just as they always did in this rough-and-tumble world of ours.

Ah! there are many little tragedies on the gardening stage. More than one good man has pushed his way to the front, perhaps beginning his career of responsibility as head of a single-handed establishment, and then worked upwards till he obtained control of what is known as a good place. But some men are not equal to success, and lose their balance when they reach a high position. Illustrations which prove this are common enough in the gardening world, and most of us are acquainted with men who did not know when they were well off, but grew too big or acted in some other foolish way until the end came and they found themselves "out of place." Some are fortunate enough to meet with other appointments, but not all, and, with reputations partly gone, they slide and slide till the single-handed haven opens its doors for their reception.

But the single-handed gardener who has fallen from a higher place may also claim our sympathy, for perhaps he is the victim of circumstances. The destiny of a gardener often hangs by slender threads, for he plays his part in the world of luxury. He may go on for years in peace and comfort, becoming wedded to his own particular sphere in life till he is really unsuited for any other, and then something happens. A death in the family he serves, a change of ownership, or some stroke of financial misfortune may make all the difference to him, and, without being actually to blame, he finds himself amongst the ranks of the single-handed.

But there is a good deal of bounce about some gardeners. They go up and then come down, but the bump on to the single-handed place is not sufficient to hold them there, and after a spell, during which they perhaps learn useful lessons, they bounce up again, and we find them once more in the ranks of their former friends. The society of gardeners is not unlike the rest of the world. The fraternity is a broad one, and the word "gardener" is comprehensive; but in a social sense there are lines of division. Go to a big show, or a gathering of horticulturists, and you will see it. There the heads of tip-top establishments hob-nob together quite naturally, and have very little in common with the pair of single-handed friends who are enjoying the rare luxury of a "day off," and are taking just as much interest in the proceedings. I do not mean to say that the "big heads" are in any way snobbish, because these lines of distinction come quite natural in all occupations comprised of various degrees.

To get an idea of what our young gardener in the bothy thinks of single-handed prospects, you should watch him scan the advertisement columns of his horticultural journal at the time when he wants to make a move, and note his air of disgust when he comes to the paragraph (there are a good many of this kind) which states that a gardener, single-handed, is wanted, who will be expected to fulfil sundry other duties which come outside the range of horticulture. The young man has arrived at a critical period of his life. He has jogged through the years of probationship pleasantly enough, and has followed the orthodox routine of moving from place to place to gain his experience, with the vision of a good appointment before him all along; but when the time comes he finds that these are not so numerous as he fancied. What had he better do—put his pride in his pocket and seize the single-handed chance that offers itself, with a determination to make it a stepping-stone to something better, or wait for an appointment that is more to his liking? Some would advise him one way, and some would advise him another; but he has to decide for himself, and I would suggest that he might be something worse than a single-handed gardener, so long as he does his duty in that capacity.

There is always one fine thing about starting at the bottom of the ladder. There is no danger of falling far to begin with, and there is plenty of room higher up. Many good gardeners of to-day have looked at the matter in this light, and from the

single-handed stage they have climbed on till they attained their present positions.

And what part does the single-handed man play in the world of gardening? It is a large and important one, and in extent the greatest, for whereas the plums of the occupation are comparatively few and widely known, establishments requiring the services of one gardener, with occasional help from the man who attends to the pony, or the boy who cleans the knives and shoes, are as common as the proverbial mushroom. And the single-handed gardener—that is to say, if he is worthy of the name—is a man of parts. There is nothing of the specialist about him, but he is an all-round man with a capacity for apportioning out his time so as to make the most of his days. As a rule he finds himself with rather more than he can do, and between his bit of glass, the kitchen garden, and the pleasure ground, his resources are frequently taxed to the utmost. If he has a worrying master or a fussy mistress, he has my sympathy, but if comfortable in this respect he generally finds ways and means of keeping abreast of his work. For the sake of his reputation as a gardener the little glass houses must be kept tidy and the conservatory cheerful. The household demand allows for no neglect in the kitchen garden, and for appearance sake the limited pleasure ground must not be overlooked. And in addition to everyday duties, our single-handed gardener is often an exhibitor in a small way. Being a professional, he has some standing in the immediate neighbourhood, and at many local shows plants, fruits, and vegetables are frequently exhibited that do great credit to the single-handed practitioners who grow them.

The single-handed man has few chances of showing his handiwork to the outside world, because his "little place" is rarely open to inspection. Pretentious establishments are visited by important persons, and the gardener's reputation is spread about in this way. Large gardens are illustrated and described in the

*Phalaenopsis intermedia Portei.*

horticultural journals, but the charge of our single-handed friend remains in obscurity. In spite of this, good work is done in small gardens, and many excellent practitioners are to be found amongst the ranks of the single-handed.—H. G.

# NOTES & NOTICES

## Cocoa Trees in Fruit.

Writing from Norfolk House, Beulah Hill, Upper Norwood, S.E., Mr. James Epps, jun., informs us that at the present time he has Cocoa trees in fruit and blossom in his garden.

## Mr. P. Barr to Visit Egypt.

At the annual dinner of the United Horticultural Benefit and Provident Society on Tuesday evening, Mr. Peter Barr, V.M.H., occupied the chair, and, in the course of an address, intimated that he hoped to visit all the leading gardens in England, and, further, that if he has health and strength, he will journey to Khartoum and the Cataracts of the Nile, visiting also Jerusalem and other cities.

## Symons Gold Medal in Meteorology.

The Council of the Royal Meteorological Society have designated Hofrath Dr. Julius Hann, of Vienna, as the recipient of the Symons Gold Medal, in recognition of the valuable work he has done in connection with meteorological science. This medal, which is awarded biennially, was founded in memory of the late Mr. G. J. Symons, F.R.S., the distinguished meteorologist and originator of the British Rainfall Organisation. The Medal will be presented at the annual meeting of the Society, on January 20, 1904.

## Mr. S. B. Dicks.

Mr. S. B. Dicks, representing Cooper, Taber and Co., of London, sailed from New York over a week ago. Mr. Dicks' experience in the United States on this last trip has not been one of the most enjoyable, he having been taken down with appendicitis shortly after his arrival in New York, last August, and whilst en route to Boston, in which latter city a successful operation was performed. The great respect in which Mr. Dicks is held by the seed trade of America was amply testified to during his enforced idleness, and he speaks feelingly of the good-will shown toward him by all, and most particularly of the unremitting care and kindness of Mr. Archibald Smith, of Joseph Breck and Sons, Inc., Boston, who daily visited him while in the hospital and attended to his personal and business matters. Mr. Dicks, at home, will take a well-earned rest for a month, by which time we hope he will be fully restored to health and strength. That he may be spared to visit America again and oftentimes is the spontaneous expression of the Trade of which he is so valued a member.

## National Chrysanthemum Society.

A meeting of the Executive Committee took place at Carr's Restaurant, Strand, on October 26, Mr. Thomas Bevan presiding over a good attendance. After reading the minutes of the last meeting and some correspondence, an interim financial statement was submitted showing a balance at the bank of £129 15s. 11d. Mr. C. Harman Payne announced the publication of the new official catalogue, and said it was in brisk demand; also that a deputation from the Society would visit the Chrysanthemum Exhibition at Lille early next month, and set forth the arrangements made for the visit; he also stated that the National Chrysanthemum Society of France had issued a chart, with illustrations, dealing with the diseases and insect pests which affect the Chrysanthemum, which he thought to be of a valuable character; and he proposed that it be mounted and exhibited at the Crystal Palace Show, which was agreed to. Stewards were appointed for the show on the 10th inst. It was announced that the Floral Committee would meet at 1.0 p.m., the Classification Committee at 1.30, and that the Arbitration Committee meet later in the day to deal with any protests. Mr. Payne produced the Diploma granted by the French National Chrysanthemum Society, two years ago, for an exhibit of blooms sent over by the N.C.S., and it was resolved that that, with medals received at various times from abroad, be exhibited at the Crystal Palace. A number of new members were elected, and the meeting closed with a vote of thanks to the chairman.

## Postal Package Lost in Transit.

We have received from the London postal authorities part of a wrapper addressed to the Editor of this paper and bearing a 2d. stamp, indistinctly marked "Well—," but the contents are missing. Does any contributor recognise this as part of a despatch?

## Women's School of Gardening, Midlothian.

The Misses Barker and Morison recently removed their School of Gardening from Musselburgh, Midlothian, to Corstorphine, in the same county, and this was formally opened on Friday last by the Countess of Aberdeen. At present there are five resident students, and a number journey out from Edinburgh, which is within a two miles' drive. We visited the garden in August, and will shortly have further references about it.

## Help for the Gardeners' Royal Benevolent Institution.

As is his yearly custom, Mr. A. J. Brown, Jessamine Cottage, Chertsey, and superintendent of the garden at the School of Handicrafts there, has arranged a concert for November 12, to be held in the Constitutional Hall, Chertsey. As a rule, this is supported both by Mr. Harry J. Veitch and Mr. G. J. Ingram, officials of the Institution, which benefits to the extent of the surplus of takings over expenses, in connection with the event. The local residents of note also take a keen interest in the matter. From the programme sent, we are sure that a most enjoyable and profitable evening will be recorded, and any well-wisher of the Institution can either secure tickets from Mr. Brown, or, if they feel disposed, can send a cheque to help cover the expenses.

## The Recent Gardeners' Dinner.

At a meeting of the Committee (which so successfully conducted the festival), held on Tuesday last, a balance-sheet was presented, showing that the total income from sale of tickets was £121 15s. The expenditure was £109 10s. 1d., leaving in the hands of the treasurer a balance of £12 4s. 11d. This time it was agreed it should be given to the gardening charities as follows: eight guineas to the Gardeners' Benevolent Samaritan fund and £4 to the Orphan Fund, the deficiency being made up by the Committee. The whole of the work was done voluntarily, not a penny being paid to any member of the Committee or officials for services rendered. Very cordial votes of thanks were given to Viscount Duncannon for presiding at the dinner, to Leopold de Rothschild for splendid liberality, to Messrs. Jas. Veitch and Sons for their beautiful table decorations, to the Horticultural Club for Committee accommodation, to the gardening Press, and to the officials. The dinner photograph is a most interesting memento.

## Testimonial to Mr. W. B. Latham.

A complimentary dinner and an address were given on October 22 to Mr. Latham, on the occasion of his resignation of the directorship of the Botanical Gardens, Edgbaston, Birmingham. Mr. Owen Thomas, late gardener in chief to the King, occupied the chair, and there were about sixty friends present. At the close of the excellent dinner, held at the Collanade Hotel, Councillor Ernest Martineau presented Mr. Latham with the beautifully illuminated address and a purse of gold, wishing his respected friend of many years' standing the enjoyment of health and happiness for long years to come. Mr. Latham thanked Mr. Martineau and the donors for their kind recognition of his services, and expressed a hope that for many years to come he might be spared to still enjoy their friendship and horticultural associations. On behalf of the Midland Carnation Society, Mr. H. Paton, presented Mr. Latham with a large framed photograph of some of the members, exhibitors, and judges of the Society's exhibition, held in the Botanical Gardens on August last. The picture was nicely framed, and Mr. Latham is represented in the group. Professor W. Hillhouse adverted to his thirty years' connection with Mr. Latham as honorary secretary of the Botanical Gardens, Edgbaston, and trusted that for many years to come he might be spared to enjoy his well-merited rest, at Rowington, near Warwick. Other toasts followed, and the evening's proceedings were enhanced by an excellent musical programme. Letters of apology for absence, and congratulations from friends, including one from Mr. Pettigrew, superintendent of the Public Park, Boston, U.S.A., one of the earliest pupils under Mr. Latham at Edgbaston, were read.

## Amateur Rosarians.

**The Very Rev. the Dean of Rochester, D.D., V.M.H.**

The venerated Dean of Rochester is one of England's truly noble men. Towering above his fellows, both in mind and body, his part in life has been, and still remains, one of continued exertion on behalf of his fellow citizens. Wise, genial and full of wit, the Dean's presence at any horticultural celebration (for we must allude to his actions in our own sphere) marks it at once as of interest, and each occasion, too, re-emphasises his earnest sympathy with gardeners and his enthusiasm for gardening. He has been a very tower of strength to the National Rose Society, of which he is the President, and by his single influence, when the Rose shows could no longer be held at the Crystal Palace, he secured the site of the Temple Garden—that excellently situated private garden of the Benchers of the Inner Temple.

Dean Hole cultivates Roses by thousands, though, of course, he does not now exhibit them. He has written about them, however, in his pleasant "Book About Roses, How to Grow and Show Them," and the collection selected by him and given therein, forms "the Dean's collection," which Messrs. Ben. Cant and Sons (and possibly other firms) grow and offer as such. This "Book About Roses" was first published in 1869, the author's name being simply given as S. Reynolds Hole. It now has run to its 15th edition, and is widely read and known outside rosarian circles.

Besides this little work on Roses, the venerable Dean published "A Book About the Garden and Gardeners" and "Our Gardens," the latter in 1899, as well as nine or ten other prominent books on subjects more or less removed from that before us.

Born at Cauntton Manor in 1819, S. Reynolds Hole fell enamoured with Queen Rose on the threshold of manhood, and, indeed, it is over forty years since he, as founder of the National Rose Society, inaugurated its first show. The Dean presided at the Rose Conference, held by the Royal Horticultural Society in 1889, and last year, at Holland House, he was again found in the presidential chair.

**Rev. C. H. Bulmer.**

The nom de plume "Herefordshire Incumbent," is one of the most familiar in the pages of the *Journal of Horticulture*, and we daresay that those querists who are not infrequently found signing themselves as a "Forty Years' Reader," can remember notes from the pen of our respected correspondent all that time; and we are sure that the writing of the letters has been as pleasurable to Mr. Bulmer as to our readers.

Mr. Bulmer lives and labours at Credenhill in Herefordshire, where a son (or sons) is prominent in the cider and perry industries. A keen love for Roses has always been a notable trait in his character, and it will be seen that he, though so far removed from London, has never been prevented by that circumstance from being a friend to, and moving spirit in, the National Society of rosarians. He was one of that notable group which included Dean Hole, Robert Baker, and William Paul, who founded the N.R.S. forty years ago, when he exhibited at its shows; and again he rejoiced to be in a position to propose its resuscitation in 1876 at a large and representative meeting of the Horticultural Club. Together with Mr. George Paul as temporary honorary secretary, Mr. Bulmer had kept the idea alive.

Long before 1864, however, our veteran correspondent had founded the West of England Rose Society, which is "the veritable parent of all existing Rose societies," as he on one occasion wrote.

In other fields also, of horticultural enterprise, Mr. Bulmer can fairly claim a place. At the introduction of that standard work, "The Herefordshire Pomona," (1878), two papers from his pen were included on "The Orchard and its Products"; about which, as a guarantee of their accuracy and scientific value, it is only necessary to add that the editor was the late Dr. Hogg, the pomologist of the age. To furnish materials for this work during its publication in parts, there was commenced and continued down to the present day, an exhibition of Apples and Pears, with such marked success as to become now in extent and excellence an annual fruit exhibition second to none in the kingdom.

**Rev. A. Foster-Melliar.**

In a sense, the Rector of Sproughton requires no introduction to the gardening brotherhood of every parish in the land, who name the "Journal" as their favourite paper, for he has "railed 'em" from his retreat for many years. But we are favoured now in presenting his portrait and a few personal notes.

Mr. Foster-Melliar has been interested from boyhood in Roses, and his work amongst them will extend back nigh forty years. It was not till 1879, however, that he entered the exhibitors' lists, and whatever his earlier successes may have amounted to, he has not said, but in later times—1893, for example—we know that he won the Tea and Noisette challenge trophy, and about the same period he gained the medal for the best Tea or Noisette at five successive shows of the National Rose Society. The varieties, we find, were Souvenir d'Elise (twice), Madame Cusin, Maréchal Niel, and La Boule d'Or. For the last year or two circumstances have prevented his attending the National Rose Society's shows or meetings; but he still exhibits locally, and is not often beaten in East Anglia, except by Mr. O. G. Orpen, of Colchester. During the present year the veteran rosarian not only won the cup for amateurs at Diss, in Norfolk, but also was first, defeating Messrs. Frank Cant and Co. in both the open classes.

The Rev. Foster-Melliar is a genuine amateur, and with the excep-

tion of some help in manuring, digging and planting attends to all the requirements of his Roses with his own hands. But not only is he a Rose grower of the keenest pattern, he is specially fond of Water Lilies, Violets and—autumnal Strawberries! On another page of this issue we illustrate his achievements with "the king of small fruits," and his own pen has discussed the idiosyncrasies of the Violets he has tried, and the ins and outs of their cultural needs.

The Water Lilies this year, alas! went to form caddis worms—those peculiar aquatic grubs that encase themselves in grains of sand or shell, wood, straw or leaves—which ate the young growths in their earliest formation; and discovery was not made till the Lilies' season was far spent. Of the long beds of Roses out on the lawn before the quiet old Rectory, and of the hundreds of budded Briars—the buds already, in late September, grown up six inches on some of the trees—of these we may not write here, but must rest content with the simple reference.

As author of "The Book of the Rose" (Macmillan), which was published in 1894, and a second thoroughly revised edition in 1902, Mr. Foster-Melliar's name will long be kept in remembrance, for it is the best handbook the Rose exhibitor has before him.

**Mr. Conway Jones.**

Mr. Conway Jones, of Blenheim House, Hucclecote, Gloucester, is one of the best known amateur rosarians in the West, and exhibits, perhaps, more frequently in London and at the National Rose Society's provincial shows than any other amateur from Gloucester or the neighbouring counties. He went to Glasgow this year with nine exhibits and was rewarded by eight successes, including the silver medal for the best Hybrid Tea, and was a close second for the trophy. At Gloucester, Mr. Conway Jones stood first for the twenty-four varieties, besides securing other testimonies to his skill both here and at Hereford, Bath, and Reading.

As a member of the National Rose Society he watches its interests in his own sphere of influence, and doubtless he will be called upon to "beat the drum" at the (proposed) visit of the National Rose Society to Gloucester next year. We believe that the provincial show will be held there in 1904. And naturally, at the founding of the Gloucestershire Rose Society fifteen years ago, Mr. Conway Jones was a leader, and has always been a prominent member of that body.

We have had the pleasure of meeting this lover of Roses at the annual general gatherings of rosarians at Westminster, from which his genial personality would be missed, and we know from experience that he has been the means of encouraging many of his friends to become cultivators of flowers and devotees of gardening. He is always willing to render assistance to beginners. In a letter to us he once observed:—"I am a very busy man, and my rosery is my great hobby and pleasure. My favourite Roses are the Teas, though I must acknowledge the Hybrid Teas are very beautiful and delightful to grow. I know of no better recreation for a business man than Rose growing, and I am pleased to say I have induced many of my friends and neighbours to take up the hobby, very much to their delight and advantage."

**Mr. Edward Mawley.**

As honorary secretary to the National Rose Society, Mr. Mawley has the success or non-success of that body largely in his hands. Since the late honorary secretary (Rev. H. H. Dombrain) retired owing to the infirmities of age, Mr. Mawley has proved that he is determined to do everything possible for the maintenance of its progress, though naturally he had the brunt of the work upon him during the later years of his co-ordination in the secretariat. When he first became attached to the National Rose Society he was living at Croydon in Surrey, where he never grew more than 400 plants (Roses); but so successful was he at the exhibitions, that he was called the "Champion of the Light Weights." With the exception of the year 1894, we believe Mr. Mawley has exhibited at every show of the N.R.S. as well as at its provincial centres from year to year.

In 1888 the rosarian left Croydon for Rosebank, Berkhamsted, Hertfordshire, and on the rather cold clay there, he cultivates both Roses and Dahlias, these being specialised. In the year 1894 Mr. Mawley ventured to Hitchin, and his judgment served him well in this contest with the champion grower, Mr. E. B. Lindsell, from whom he won the honours of the day. Truly, 'twas bearding the lion in his den. But the Berkhamsted Roses had excelled previously, we mean specially, for in 1888 Mr. Mawley secured the medal for the best H.P., and in 1892 for the leading Tea. He exhibits at a number of the noted shows in the Home Counties with distinction.

It is hardly necessary to say that Mr. Mawley is the compiler of this journal's Rose and Dahlia analyses, both of which are models of careful preparation, and invaluable as records. For many years he also contributed the section in the "Rosarians' Year Book," entitled "The Weather of the Rose Year," and we believe that at Berkhamsted he has the most carefully equipped private meteorological observatory in the country. He is secretary to the Royal Meteorological Society, with a seat on the Council; and besides other writings, he annually prepares the Phenological Record for that Society, and this "Record" takes account of the dates of the coming and going of migratory birds, the opening of certain well-known flowers, the falling of leaves, &c.—in short, the natural phenomena of Nature. Mr. Mawley, therefore, is one of the most useful citizens of the Motherland, doing good work in a very quiet way, and he is well assisted and encouraged by his wife.

Mr. Conway Jones.

**Mr. Herbert E. Molyneux.**

Prefatory we may remark that Mr. Herbert E. Molyneux, of the world of Roses, has no family relationship to the other Mr. Molyneux, famed mostly in connection with the Chrysanthemum, the floral queen of the autumn and winter. He is one of the younger generation of amateur rosarians, in the front rank as an exhibitor, and though his garden at Balham is well within the six miles area of Charing Cross, where the smokiness may be said to constitute a grievance, he is yet successful wherever his flowers go. This year he did well at Sutton in Surrey, and at Harrow, as elsewhere; while the year before, though he only put three boxes in competition, owing to family bereavement, he nevertheless won two first prizes and one second, as well as two silver medals—surely not a bad day's work.

It may be mentioned that Mr. Molyneux read a paper before the Horticultural Club in December last year on "Rose-Growing Near Large Towns," which was so much appreciated that it has since been published in pamphlet form, after having been incorporated in vol. xxvii., part 4, of the Royal Horticultural Society's Journal. That paper has the right spirit, the true rosarian's love for his flowers, running along its lines, and we hope its message may have searched the hearts of even a few suburban residents whose inclinations are horticultural, and only require encouragement. "What man has done, man may do."

Mr. Molyneux is one of the joint auditors of the National Rose Society and also a member of the committee. He has done good work as honorary local secretary, and is well known as a judge at the Temple Rose Show and at others near London. His pen, too, finds occasional employment in describing "Roses" through the gardening Press.

**Rev. F. Page-Roberts.**

Mr. F. Page-Roberts began Rose growing at Scole Rectory, Norfolk, in 1876 in the poorest of sandy soils sloping to the south. He exhibited for the first time in 1881 in that excellent class for those who have never won a prize at the National Rose Society's shows, and won one of the prizes. From that year, although the severe winters of 1891-92-93 killed more than 2,000 Teas, and he again lost a great many in the winter of '95—he exhibited successfully, nevertheless, in the principal classes for Teas, being first four times in five years—the years when the principal class for Teas was raised from twelve to eighteen. He moved this year (1903) from Halstead, Kent, where his Roses were beginning to do well, to Strathfieldsaye Rectory in Hampshire. This time he has a real Rose soil to deal with. He showed only once this year—at the Reading Rose Show—winning three first prizes, one second, and the prize for the best Rose, with flowers cut from the trees that were moved in March. The Rev.

Page-Roberts attends to the trees entirely himself, and if he could win prizes with Roses on a poor sandy soil in Norfolk, where will he stand now, when he has "a real Rose soil?" There will be increased zest in the shows wherever the Strathfieldsaye Roses meet those from the east, the north or the metropolitan area. Mr. Page-Roberts takes a warm interest in the National Rose Society, and is a faithful attender of its meetings.

**Rev. J. H. Pemberton.**

Mr. Pemberton is a gentleman of great energy, and what time he can afford from his clerical duties in a poor and thickly populated district, he devotes to Rose culture. He was one of the earliest to revive a taste for the "garden" Roses, for at a National Rose Society's show, held at South Kensington, he staged twelve varieties of old-fashioned Roses in boxes, labelling them "Grandmothers' Roses," giving delight to hosts of the visitors, who would be sure to remember an exhibit of this nature. These old Roses were a few found by Mr. Pemberton in his own garden, which, by the way, was his father's and grandfather's before him.

Living at Romford, a little to the east of London, it might be thought that he had difficulty in staging first-rate blossoms, but he does it. Moreover, the work is all done by himself and his equally devoted sister, except some of the digging and hosing, and truly 4,000 Rose bushes require much loving care. The enthusiastic cleric, however, knows his plants by heart, and is never in a quandary when blooms are to be selected.

And Mr. Pemberton is an out-and-out exhibitor; he has staged at a show on June 18 (1896), and continued all the while to August 1, exhibiting forty-nine times and winning forty-eight prizes, including two challenge trophies, and two cups and medals. If that is not a record, we want to hear where the record lies! He has been amongst Roses from childhood. His father taught him to bud, prune, graft, &c., while he was still a

lad, and so far back as 1874 he won his first premier award. Exhibiting at the inaugural show of the National Rose Society in St. James' Hall in a class for twelve distinct varieties, he came second out of forty competitors, and has never been absent from one exhibition of the "National."

Amongst other successes, Mr. Pemberton has been first three times in the amateurs' trophy class; been second six times, and thrice third, but never out of it altogether. The Jubilee trophy has also fallen to him four times. As a judge of Roses he is always in request, for he knows varieties exceptionally well. He always forms one of the adjudicators in the nurserymen's great class for seventy-two distinct varieties, which honour could only be accorded to very, very few. Mr. Pemberton writes a good deal to the gardening papers, and is now the leading spirit in a movement to get the National Rose Society to establish two-days Rose shows. As a vice-president of that body he takes the keenest interest in its working.

Mr. H. Molyneux.

### Roses in America.

As I never was in America, it seems likely that "A. W." (page 349) knows more about Rose culture there than I do. I simply relied upon the information sent me, by pamphlets, papers, and letters. The pamphlet related to the growing of Roses in Oregon, a Western State, and the author certainly gives one to understand that most of his plants are budded, either on Manetti or the Briar. He admits that some prefer them on their own roots; but, like everyone who has had sufficient experience, finds it only answers for certain varieties. I am much surprised to hear that American nurserymen can grow their indoor blooms for sale on cuttings which are afterwards thrown away. I thought they were budded, or more probably grafted, on Manetti.—W. R. RAILLEN.

### Wire Net for Peas and Strawberries.

In looking over a collection of papers for the purpose of reducing their number, I came across a paragraph on this subject in a *Journal of Horticulture* twenty-eight years old, which is worth reprinting.

#### "WIRE NET FOR PEAS AND STRAWBERRIES."

"To obtain Pea sticks in most of the localities of the three islands is no joke; therefore this year I ordered a quantity of 10-yard lengths of wire netting, 2 feet wide and 3-inch meshes; these I use for Peas and Strawberries. For the latter a 2-foot breadth put over in spring like an arch enables them to rise while in bloom through the meshes, and when they are ripe they are cut off the clay, clean for the mouth, beautiful to the eyesight, and ornamental; and for Peas I certainly prefer the half-hoop or arch also with them. For a 10-yard length of netting twelve pins of wood are required, 1½ inch square and 12 inches long, pointed at one end, six pieces of galvanised wire 1 yard long, with four staples of the same material; fix one of these upon two pins, leaving 2 feet clear to form your arch for the wire, drive your pins into the ground upon each side of your Peas (say 6 or 8 inches), form your arch neatly, and fix your wire over these, and use Carter's Early Gem Pea, and if your land is what it ought to be you will have a return of, may be, a hundredfold. These with me this year are fully 2 feet high, beating all the others in a canter for quantity and quality. If taller kinds are grown your arch of wire must be regulated thereto. The kinds I have this year are Ringleader, Laxton's Alpha, McLean's Little Gem, Dwarf Green Mammoth, Fillbasket, and McLean's Best of All. Each and all of them are fine crops. The Strawberries are Keen's Seedling, President, and Elton Pine. I trust this may be useful to all gardeners, but more so to such as I am. My early Peas are finished, and the gleanings saved for seed next year. Since writing the foregoing I have drawn from a line (sown in April with 12ozs of Hairs' Mammoth), the produce of two Peas which I sowed, and counting the 10 yards I find there are twenty or more plants on the yard, say 200 equal to those sent you, as every plant will give the half of these two—viz., over forty pods each. All wrinkled Peas should be sprung, picked, and planted. My experience for myself and others exceeds half a century, and I am now—OLD SECTY. JACK, Jedburgh, N.B."

I have for many years used wire netting instead of sticks for Peas, though not in the way described in the foregoing paragraph. But for Strawberries I have never used it, and think the idea an excellent one. Possibly it escaped my notice at the time of publication, but there is another possible reason for not trying it at the time. There was, on the Longleat estate, a steam engine for all sorts of purposes, including chaff-cutting. For protecting Strawberries I used straw, cut 1½ or 2 inches in length, and found very few slug-eaten fruits; for slugs do not like a shifting carpet. I am not now in a position to grow Strawberries, but commend the wire netting to those who are. For Peas that are sown in single drills, the plan I adopt to support them is to drive stakes about 4 feet apart along the centre of the row at the time of sowing, and fix the wire netting singly and upright to these stakes, keeping it three inches away from the soil. It will be found that as soon as a tendril is formed it will eagerly catch hold of the netting, and in the course of a day or two you will have a difficulty in pulling it away without breaking. In case of a plant failing to catch hold (which but rarely happens), I have a few pieces of wire bent S-fashion close

at hand, just to give it a hitch up, and it soon takes care of itself.

In another part of the Journal enclosed you will see I was one of the pioneers in bringing back to cultivation the long-neglected perennials.—WILLIAM TAYLOR, Bath.

[In the old copy sent by Mr. Taylor (dated August 19, 1875) an article by him entitled "Gems of the Herbaceous Border," is furnished as leader.—ED.]

### Potato, The Factor.

In contrast to the "phenomenal" yield of Sir John Llewelyn Potato recorded in your issue of October 8, page 335, may I cite the following?—Mr. Edward Leeson, Top Common, Hucknall Torkard, planted in spring, under ordinary conditions, 11b of Dobbie's new Potato, "The Factor," and has just lifted 61 lbs of saleable tubers. It will, therefore, be allowed that this variety holds its own as a most productive sort. It is also a good disease resister, keeps well, and cooks beautifully.—JOHN A. SIMPSON.

### Autumn Pruning of Fruit Trees.

I have found it an excellent plan, especially when dealing with trees that have for various reasons become crowded, if time permits, to take in hand at once the work of thinning the growths. Before the foliage is down there is less difficulty in discerning which branches will be best removed and which allowed to remain. I am convinced that far too many pyramids and bush trees in our gardens carry too great a number of branches. The centres are thus rendered thick and impervious to sun and air, and the fruit, when there is any upon the sunless side of the trees, is too frequently devoid of colour, and also to a greater or less degree lacks flavour. I saw some pyramid Pears in spring, whose exterior was practically as dense as a wall, and this, when growth was just beginning. How such trees can be expected to produce satisfactory crops is a mystery.—J. W.

### The Colouring of Apples.

I have to thank your correspondents for the kindly notice they have given to the questions asked under this head. "W.R. Raillem" tells us, on page 380, that cold "snaps" help very much to increase the colour of fruit. Over and over again I have had the same phenomenon cited; and, indeed, no one can deny that sharp "snaps" cause a quick transformation to bright colours. "W. S." furnishes an array of factors; and his remarks are good. When I wrote, however, I had in my mind pot-trees (these particularly) that are cultivated in every respect as they ought to be, and growing side by side for years; and asked Which has the greater influence (on such trees) the sun, or wind and rain? Root-pruning, therefore, is outside the strict limits of the argument. Nor can soil be considered, seeing that comparisons were made not with every factor that would tend to give colour, but only with sun versus rain and wind. Given orchard, or pot fruit trees, granting proper culture, what then? Is a sunny year more beneficial than a year of dull skies, wind and rain? The Editor notes that Bunyard's pot-trees were "finished in the open-air, and not under glass"; and if the fruits were uncoloured when taken out of doors, how magnificently they had coloured in this boisterous, rainy season!

I was quite averse to the wind and rain asseveration when visiting the nurseries referred to, and it was my remark that the fruits on pot-trees were remarkably well coloured that brought out the reference to the wind and rain. I was astenished, and on my making observation got the reply already quoted (page 359).—LAMASOOL.

This is a most interesting point, and as discussion is invited I willingly advance a few remarks. The main question which "Lamasool" asks is, "Are the influences of wind and rain greater in their effect on colouring fruits than sunshine?" This pertinent question is apparently asked because a firm of fruit growers have recently informed "Lamasool" that they would rather be without the sun than the wind and rain. That idea will doubtless come as a surprise to the majority of "Journal" readers, and I am inclined to think that the firm in question conveyed only an incomplete idea of the thoughts they intended to express. Without sunshine the fruit grower can do nothing; and yet all close observers know that both wind and rain do much towards hastening the colouring process in fruits—under certain conditions. It is simply a question of the proportionate distribution of food, light, warmth, air, and moisture. It is quite possible to have too much sunshine when other essential conditions are absent, and it is undoubtedly possible to have too little sunshine and too much wind and rain.

In order to have a clear conception of how various conditions may effect the colouring process, it is necessary to remember the following facts: The soil must be sufficiently rich to supply

the tree with all the necessary foods obtained from the soil; there must be sufficient moisture to dissolve those foods; sunlight is needed to allow the leaves to elaborate food from the air; a free circulation of air in the soil and throughout the branches is necessary to secure healthy growth, well ripened wood, and active leaves; and in the case of Apples the fruits must be fully exposed to light, or they will not colour perfectly—that is, they will not assume their *brightest* tints, although they will change their colour after being gathered.

Every experienced cultivator knows that when trees carrying heavy crops are fed with suitable manures the fruits colour better, as a rule, than when no feeding is practised, and that it is quite possible to gain size at the expense of colour by feeding too liberally with nitrogenous manures, although a certain amount of nitrogen is necessary to secure high colour. The above facts—which are, I believe, generally recognised—should lead one to arrive at the conclusion that the best coloured fruits are obtained during seasons when sunshine and rain are balanced in suitable proportions for crops generally, and when there is plenty of sunshine and a *moving atmosphere* at colouring time. This is really borne out in practice, for during very hot, dry summers many fruits do not colour so well as during cooler ones, simply because the food in the soil—through lack of moisture—does not dissolve quickly enough to supply the trees' needs. During a season which is hot and dry up till the middle or end of September, with copious rains after that time, I have frequently noticed that, notwithstanding the sunshine, Apples are somewhat lacking in colour till the rains come, and then take on a brilliant hue rapidly. Comparatively cold nights are also undoubtedly conducive to high colour.

Now I come to the real point: Do wind and rain exercise a more beneficial effect on the colouring of fruits than either sun or cold nights? If so, why? My opinion is that they do, at a certain stage, but that they would not do so in the absence of sunshine over a long period; and what I consider ideal conditions for colouring Apples are the following: A soil moist from recent rains: bright sunshine for several hours daily: a breezy and constantly moving atmosphere, as distinguished from a very strong wind; and, lastly, cold nights. My reasons for the opinion expressed above are these: Sunlight is needed to create the energy by the leaves to retain and elaborate carbon [carbohydrates]; in windy weather there is a more rapid circulation of air around the leaves than during calm days, and therefore the leaves can absorb the gases of the air more quickly than when opposite conditions prevail. Cold nights check growth, and the elaborated food is therefore largely available for completing the ripening process; rains moisten the soil, keep the leaves fresh and clean, and possibly leaves can absorb the ammonia brought down by rain to a greater extent than scientists generally imagine. No amount of sunshine will make up for lack of moisture in the soil, and it seems that only quite a moderate amount of sunshine is necessary at ripening time to bring about the chemical changes which provide colouring matter, so long as there is a free circulation of air and the fruit is fully exposed to light.—WARWICK.

### Potato Harvesting.

The "Home Farm" correspondent, in your issue of September 17, is concerned about Potato harvesting. He states that he is in favour of the digger, as it moves the whole ridge; and speaks of rotary fork diggers, but presumably they are of early make. Not long ago I saw reference made to a new invention which dug, graded, and basketed the tubers. I believe it was a German invention; but I ought to be more definite, and to do so I will use the words of a great American grower. He says: If you intend to grow Potatoes for profit you must have a good digger. If I could sell my experience, with Potato-digger agents and manufacturers, for what it has cost me, I should be well-to-do. There *are* good diggers, but you must make preparation before digging. If the ground is foul the weeds and trash must be cleared off by a "mower" and rake. If the ground is dry and hard, a slanting toothed harrow should be run between the rows to break the crust, thus giving the digger a better chance of separating the tubers from the soil. I am convinced that the Hoover digger is the best all round digger; firstly because it is the only digger that separates the tubers from the trash; secondly because it leaves the tubers in a narrower row, and right out of the way of the horses and wheels when digging the next row; thirdly because the Hoover separates the tubers from the soil by a forward and backward slide, thus allowing the tubers to slide off without bruising, instead of tossing them up as others do; fourthly this digger is strongly made and will bear the strain of heavy and hard soil; finally it has no cogs, is lower geared, and dirtproof in its bearings. I use four horses abreast and for a day's hauling two teams should be used. Boys do all my picking, and with tough skinned Potatoes I load the waggons direct, saving the bother and labour of sacks and boxes."

This is an outline of this big Iowa grower's digging methods; and from his remarks I judge the Hoover digger to be as marvellous in its work as is the reaper and self-binder amongst Corn.—T. A. W.

### Scottish Horticultural Association.

*Prizes for Cut Chrysanthemum Blooms, 1902.*

With your kind permission, I would like to hear the opinion of your readers in general, and Chrysanthemum growers in particular, as to the action of the Executive Committee of the above-named Society in offering a prize of the money value of £36 10s. for thirty-six Chrysanthemum blooms *confined to growers within the municipal boundaries of Edinburgh and Leith*; and the offering of a money prize of only £33 open to the whole of Scotland, for a like number of blooms. Certainly there is a Challenge Cup given with the latter, but as it never becomes the winner's property, it is of no value to him. If preferences of this kind continue to be the policy of the Executive of this Society, they may be offering next year a larger prize, confined to a 500 yard radius of Waverley Market! May I ask those interested, How this can benefit the Society (throughout Scotland), or fulfil in any way the objects for which it was instituted? In my opinion it seems absurd to give so really valuable a prize to such a confined area (where there are so few noted growers), and call it the Queen Alexandra prize. Prizes with such titles are generally "open," so as to encourage the exhibition of the finest productions, and the public will naturally expect to see such in this class. Will they do so?—INTERESTED.

### A National Potato Society.

A proposal having been made to establish a National Potato Society, it would be of interest to have the opinions on the matter of those who specialise in Potatoes. We publish two extracts from letters received from leading firms in answer to an invitation from us, and we have received other letters bearing the spirit (so far) of "benevolent neutrality."

"We gladly respond to your suggestion that we should express our views on the question of the proposed Potato Society. In view of the excitement caused by sensational paragraphs in provincial papers, it would certainly seem desirable that some central authority should exist which would be competent to express an opinion for, or against, the value of new Potatoes, for which such high prices are asked. In the outline we have seen of the proposed Society there is so little detail that it is quite impossible to say whether such a Society would or would not be in a position to test the Potatoes thoroughly. It is, of course, evident that a considerable acreage of land would be necessary, and the cultivation itself would be very costly. It occurs to us that now the Royal Horticultural Society is possessed of so valuable a new garden, it might possibly be better to approach the Council of that Society with a view of ascertaining whether they would be willing to carry out such an undertaking. In view of the splendid work which the Society has done in the past, such a proposal, if accepted, would, we feel sure, command the confidence of all."

"We are in favour," writes another firm, "of the formation of the Potato Society proposed. The Potato is an article of such vital importance to the well-being of the community that a National Society should have no difficulty in getting plenty of support, if it is prepared to undertake work which will be distinctly valuable to growers. What such work ought to be will readily occur to all practical minds."

The advisability of forming a society of the above description is being keenly discussed in the horticultural Press, and some excellent suggestions in regard to the matter have been recently advanced by Mr. W. P. Wright, who observes that we are on the "eve of a great Potato boom." I think Potato growers generally will go a step further and admit that we are "in the thick" of such a boom, judging by the sensational prices realised by some recent varieties. Considering the rapidity at which new varieties can be increased when they have once been placed in commerce, it is certainly remarkable that Northern Star should still be so high in price. Good though it undoubtedly is, it has evidently been skilfully manipulated by the Trade, and I question if we have not already reached the height of the boom in regard to highly priced varieties; but there is every probability that Potato-growing will become a much more important industry than it is even now. For that reason I welcome the idea of forming a National Society in favour of the "noble tuber," and I trust that gardeners, and all interested in Potato-growing, will unite and take steps for the formation of such a society. It is a matter of national importance that impetus be given to the raising of real disease-resisters, which crop splendidly, and are of good flavour; and when such have been obtained their merits cannot be too widely known. The public generally should, however, have some real guarantee before they purchase, that new varieties are worthy of the glowing descriptions given of them. In this respect a National Society might do much good by placing a hall mark on approved kinds which have been thoroughly tested by an impartial body of experts. Varieties of the Potato, however, differ so much when grown in different districts and on different soils, that the only true method of testing them is the one Mr. Wright suggests, viz., conducting trial plots in various parts of the United Kingdom.—H. D.

### Autumnal Strawberries.

I do not think my friend "J. H. D." (page 350) has laid sufficient stress upon what I believe to be the reason of my success with St. Joseph Strawberry. The secret is, after the chosen runners are selected to root around the original plant, to allow no more runners to appear at all on the whole bed. After the first crop of fruit is over, runners appear in extraordinary abundance, and should be suppressed as soon as they appear, the bed should be carefully gone over at least every other day during August, and every runner pinched right back as soon as it appears. There will still be some fruit, a small supply, but gradually towards the end of August more and more flower trusses will appear instead of runners, till in September hardly anything but flower trusses are formed. The September fruits are much larger as well as much more numerous than the midsummer crop, but I have not yet experienced a decent autumn to do them justice. The St. Antoine bed was burned twice to the ground in the second week in June, and all the ashes were clean swept away; fresh growth was observed on the third day, and a bloom truss in a fortnight. It is my belief that if all runners were suppressed from ordinary Strawberries, the plants would last in vigour a good deal longer than they generally do.—W. R. RAILLEM.

### Notes on Pines.

As growth advances more or less in these plants during the winter months, and does no harm provided it is effected by natural means, only sufficient fire heat being employed to sustain the plants in health and maintain the progress made, they should be placed near the glass; this will enable them to make the best of every ray of light and sunshine whenever it prevails. Though the plants may not perceptibly grow, they store essential matter in spells of bright weather, and become stouter where due attention is given to keeping the glass clean and admitting air when necessary. The sturdy plant throws up a large, well developed fruit in due season; but the drawn, weakly plant, though large in leaf, furnishes a much smaller fruit on a lanky stem at an uncertain and irregular time. To give the plants the benefit of clean glass, therefore, and proximity to it without touching, is to grow with a view to fruit; and to keep them at a considerable distance from the glass and covered, or beneath glass more or less opaque through dirt, is to produce foliage instead of fruit. The beds of fermenting materials subside considerably through decomposition, and freshly made up ones settle rapidly unless well trodden down. In either case prompt attention should be given to raising the plants, so that they may have the full benefit of the light, and in doing so take care not to chill or allow them to become overheated at the roots.

New beds should be made as necessary. The best plan is to remove the plants to a structure with the suitable temperature, clear out the old fermenting material, supply fresh, and not return the plants until the beds are in a proper condition. To take Pine plants from a warm house and keep them in a cold place chills them, and returning to warm beds from cool quarters acts in the opposite direction, sometimes causing them to "bolt"—that is, throw up fruit prematurely. Oak, Beech, and Spanish Chestnut leaves are much the best, as they are more durable than others, and the heat is consequently milder and lasts longer. Tan, of course, is best where it can be easily secured, and about half the quantity suffices: but leaves, in many cases, are procurable for nothing beyond the labour.

It is a good and necessary practice to assist the plants according to their respective requirements before winter. If not done earlier, it should be attended to without delay. Fruiting plants require the best places, to swell off the fruits properly, particularly at this season when natural aid is at a minimum. These plants must have a night temperature of 65deg, and 70deg to 75deg by day. Successional plants only require a night temperature of 60deg, and 65deg by day, with an advance from sun heat—but not without air—to 70deg to 75deg. Young plants must not be brought forward too rapidly, because they are not prepared, nor is the winter season an advisable time to cause them to make much growth, and they will progress quite fast enough and satisfactorily in a temperature of 55deg to 60deg at night, and 60deg to 65deg in the daytime, above which ventilate freely, taking care to avoid chills.—PRACTICE.

### Early Forced Fig Trees in Pots.

Figs are receiving more attention now than for some time past, which is not to be wondered at, as ripe Figs are very wholesome, and early Figs are very much prized for the dessert. Trees intended for affording fruit at the close of April or early in May will now need dressing with an insecticide, all those advertised being very efficacious when properly applied by implicitly following the instructions. Very little pruning will be necessary, the trees having been regularly stopped during the growing season; but if the growths are too crowded and irregular, they may be thinned to render the trees relatively open and symmetrical.

The house in which the trees are forced should have the woodwork and walls washed with hot water, afterwards lime-washing the latter with hot lime and sulphur, a handful of the latter to each pailful of limewash. A mild bottom heat is almost essential to a successful swelling and perfecting of the earliest crop, the pots being raised upon loose bricks, pedestal fashion, in the position they are to occupy in the bed, and so that the rims of the pots will be slightly above the level of the pit edges. The depth of the pit should be about three feet, and filled with Oak or Beech leaves pressed firmly. Care should be taken to avoid overheating.—F. K. S.

### Late Houses of Figs.

Excessively luxuriant trees should be attended to in lifting and root-pruning. Fig trees can hardly have the roots too much restricted for fruitfulness, being also more under control, and can be fed according to requirements. Trees in unheated houses should have free ventilation, and when the leaves fall the trees must be unloosed from the trellis, tied together in convenient bundles, and made safe against frost with some straw or fern over them, encasing the bundles in mats. In heated houses this is not necessary, but the trees in these must not be exposed to severe frost, or they are liable to be injured; therefore a little warmth will be necessary in severe weather. Trees in cool houses should have the roots protected by a covering of dry material, and close up to the stems.—GROWER.

### Grapes at Pitcullen, Perth.

It is always interesting to have a walk through the fine gardens at Pitcullen, but more especially when the vineries are at their best. Mr. Leslie, the gardener, has had charge here for seventeen or eighteen years, and is well known as a Grape grower who long ago won his degree in open competition. There are seven houses in all devoted to the cultivation of the Vine at Pitcullen, and each of these has its interesting features. The earliest house at the time of my visit had all the fruit cut, and the Vines were making preparation for next year's crop. Mr. Leslie does not believe in leaving anything to chance, but uses every means to get the wood thoroughly well ripened, as only such wood will produce first-class bunches. Hamburgs are chiefly grown in this house, and the Vines (which are only a few years old) annually yield excellent crops. In the next house we find Hamburgs, Madresfield Court, Duke of Buccleuch, and one or two others. Madresfield Court does splendidly, producing beautiful bunches and invariably colouring well. A small rod of Diamond Jubilee was also here, and this is a very handsome Grape, beautiful in bunch and berry, but unfortunately its quality is only second-rate. Growing side by side was a cane of Duke of Buccleuch, equally handsome in appearance and first-rate in quality. In tasting this variety I was forcibly reminded of my first acquaintance with this noble Grape, something like twenty-two years ago, when I tasted it for the first time in the vinery at Arkleton, when on a visit to my much esteemed friend, the late Mr. James Dickson. Another fine variety is growing in this house, viz., Dr. Hogg, which was a great favourite with the late Mr. Coates, who much appreciated its rich flavour. Its appearance, however, is not such as to commend it to exhibitors, as it is small in the berry and somewhat apt to be irregular in size. To those, however, who appreciate flavour before handsome appearance, Dr. Hogg should find favour. Alicantes are beautifully "finished" at Pitcullen, and at the time of my visit scores of splendid bunches were to be seen. These were really grand clusters, weighing six or seven pounds, slate-black in colour, and carrying a beautiful bloom.

Appley Towers finds favour with Mr. Leslie. It produces medium sized bunches, sets well, and, as a rule, finishes beautifully; the quality is also good. Lady Hutt, which originated from the same source, is also represented. The colour is a trifle against it, but it hangs well, and consequently it is found useful. Gros Maroc is also represented by huge bunches of symmetrical form—a truly grand show variety. A whole house is devoted to Gros Colman, and grand both in bunch and berry they were. Once they are thoroughly ripe, the Grapes in this house will be a perfect picture. Another house, in which Peaches were formerly grown, was recently planted with Colmans, and these are now in full bearing. They are in great demand for winter use. Muscats also have a house devoted to them, and, like the others already noticed, they annually yield heavy crops of excellent

fruit. Mrs. Pince finds a home among the Muscats, and does remarkably well. Mr. Leslie believes in giving his Vines generous treatment, otherwise he could not cut year after year such heavy crops of first-class Grapes. Although a total abstainer himself, he supplies his Vines liberally with something stronger than water from the well. Regarding pruning, the gardener makes no attempt to have beautiful spurs, but rather the opposite, the rods in winter presenting a rather "rustic" appearance. A thoroughly developed, well ripened bud is what is sought for, and the lateral is cut to this, the result being as we have indicated—first-class Grapes. For a long period of years Mr. Leslie has been a successful exhibitor of Grapes at Edinburgh, Glasgow, Dundee, and Perth, and we trust he may still long be spared to grow and show as successfully as he has done in the past.—ALBYN.

### The New Melon, "Fiscal Problem."

In making a call at Bear Wood Gardens recently to see the Chrysanthemums, I had an opportunity of viewing the new Melon that was granted an award of merit on October 13 at the Drill Hall, under the name of "Fiscal Problem." On a shelf in one of the houses—there are half-a-dozen here—lay 1½ dozen fruits, and every fruit such as one expects to see in August, rather than the last week in October. I afterwards saw about two dozen more growing on the plants. The fruit is nearly round, strongly but not finely netted, and the habit of the plants was all that could be desired. Mr. Barnes kindly cut one of the fruits for me to taste, and I found the flavour excellent. It is, I believe, the result of a cross between Eureka and a seedling, with the flavour of the former, which, when well grown, is known as one of the finest flavoured Melons in cultivation. I came to the same conclusion as the judges at the Drill Hall—that this is a very fine Melon with a very bad name, which name I was given to understand was not unlikely to be altered.—T. COLE, Swallowfield Park Gardens, nr. Reading.

### The Merits of Grapes.

With much of what "Expert" (page 378) writes about the different varieties of Grapes one cannot fail to agree. When, however, he informs us that West's St. Peter's is of no use where appearance at table is the chief merit in a Grape, I trust he will excuse me if I take exception to such an overwhelming dictum. My experience of this variety when at its best, leads me to directly contradict "Expert," and to say that when well cultivated it is a really fine table Grape. I know quite well that it is frequently poor in appearance, small in berry, and loose and straggling in the bunch; but that it can be produced of noble appearance, as well as of good quality, many growers are aware besides—TREWEN.

### Combating Apple Scab.

Experimental spraying operations carried on in orchards in Ottawa, furnish excellent illustrations of the necessity of spraying. In every case where a single tree or part of a tree in one of the sprayed orchards was neglected the fruit on such tree or part of tree is to-day hardly worth the trouble of picking, while on all sprayed portions scab is hardly to be found.

### Hints to Secretaries of Shows.

I do not intend these notes to apply to secretaries of experience, but to those who may be undertaking this office for the first time. No doubt there are many such, and they may find a hint or two, collected from experience, of some value in guiding them in their duties.

Small details are at times overlooked, and these all add to the smooth working of a society for success or the reverse. One fault with secretaries—a common one—is that of being too easy with exhibitors. Instead of making it a rule to clear the room at a stated time, they are far too lax in this respect. It is a good plan to ring a bell, say, ten minutes before the appointed time, as a warning to exhibitors, and again punctually at the time stated in the schedule. Judges have then ample time to make their awards, and the clerical staff have also opportunity to get awards placed ready by the time the visitors are admitted. I have acted at shows where the awards were not on the exhibits before four o'clock, a state of management very annoying to visitors. If some of these lax secretaries would pay a visit to the Hull Show, for example, and see one of the honorary secretaries (Mr. Dixon) standing in front of the clock in the hall, two minutes before ten, with bell in hand ready to give the warning to clear the room, whether exhibitors are ready or not, they would return impressed with the result of punctuality.

Space should be marked out for all classes in plain letters. As some exhibitors do not appear to understand the class number only, it is a good plan to write on cards distinctly what the class is. For instance, "Class 12, twelve Japanese blooms." In this way an exhibitor can place his exhibits in position without worry-

A bed of St. Joseph Strawberries, Sept. 25th.

See "Autumnal Strawberries," opposite.

ing the secretary or other officials. Some exhibitors make a practice of entering in more classes than they know they can fill properly, in the hope the entries may be small, or the exhibits poor, then they can snatch an extra prize or two. It is very annoying to secretaries to find empty spaces, and especially from

exhibitors who never intended to fill all. In such gross abuses as these, some fine should be imposed.

The method of denoting the winning stand varies with individuals. As fast as the awards are made they should be denoted on the exhibits, and by the time all are adjudicated the visitors can ascertain which are the winning stands. Quite the best system is that of giving to each competitor a full-sized prize card for every exhibit that he enters, he being responsible for the proper placing of each card, which is upside-down in front of the exhibit. Upon the card is written the name and address of the exhibitor and his gardener, denoting also what the class represents, and not merely giving the schedule number, as in some instances, which, to an ordinary visitor, is complicated. A space is left near the top of the card for denoting the value of the prize—first, second, or third. When the award is made and noted in pencil on the back of the card by the judge, all that is required to complete the plan is for an attendant to follow the judges and, with adhesive printed slips, fasten to the space left for the purpose the class of prize gained—1, 2, 3, as it may be. Different coloured slips are adopted by most societies to denote the grades of prizes, viz., red, blue, and black.

When a card is given to all exhibitors (as indicated), those not receiving a prize are generally turned up after the judging by an official. Visitors like to know who are competing unsuccessfully as well as those who do win prizes. Some societies provide cards in the same way as here indicated, but enclose each in an envelope, not to be opened until the awards are made on the envelope. This entails labour which could be better spent elsewhere. The aim here is to prevent a judge knowing whose exhibit he examines. Such a precaution is superfluous with a judge of integrity.

Some societies may not wish to provide a card for each exhibit, on the score of economy in the time required to write them and the cost of such cards. The remedy in such a case is this: as fast as the entries are received, each one is denoted by a number opposite the name and address entered in a book. This same number applies to the exhibitor throughout the show. As many exhibits as he has, as many slips of paper are given him on the morning of the show. To each exhibit he places one slip, and so on throughout the show. Alongside each class—say, "Twenty-four Japanese blooms"—three prize cards are placed, simply denoting first, second, and third prizes, with a space left for the name and address of the winner. As the awards are made, the number of the exhibitor is written in pencil on the back of the card according to its grade. These cards are taken to the secretary's table to have the name and address of the winner, which is found in the entry book. I need hardly say I do not recommend this system. I give it as an alternative for the benefit of those who cannot adopt the full-card system.—E. MOLYNEUX.

## Sir William Jackson Hooker.

(Continued from page 349.)

"My father's reputation as one of the foremost botanists in this country was confirmed by his success in the Glasgow Chair, and rapidly rose as his successive publications appeared. Very soon he had but one compeer in Great Britain, Dr. Lindley, for Robert Brown towered above both as 'Botanicorum facile princeps.' It was a happy augury for the progress of the science which both worshipped with single-minded zeal, that Lindley and my father were regarded as meriting equal recognition as scientific botanists and indefatigable labourers throughout forty-five years of their active lives, and that they should have been fast friends till death, within three months of one another."

Referred to from the last sentence is the following interesting footnote, drawing attention as it does to the contemporary career of Lindley, whose name must be of great interest to the Society. "The following admirable summary of the life-works of my father and Lindley respectively is extracted from the Proceedings of the American Academy of Arts and Sciences, May 29, 1866: 'The names of Hooker and Lindley, which stood side by side in our botanical section, are naturally associated as those of the two most eminent botanists in Great Britain; also by the parallel course and near coincidence in the close of their lives. Born in the same neighbourhood, in youth receiving their education at the same school, and early drawn together by similar predilections, they both devoted themselves with singular energy and perseverance to their chosen pursuit; exerted for many years, although in somewhat different ways, a paramount influence upon the advancement of botanical science; and died near together in place and time—the elder at Kew, on August 13 last, at the age of eighty years; the younger at Turnham Green on the 1st of the ensuing November, at the age of sixty-seven years. For a long time they were the two most distinguished teachers in Great Britain, one at a northern, and the other at the Metropolitan University. They severally conducted two of the principal serial works by which botany contributes to floriculture; and they developed into highest usefulness the two great establishments—the Royal Gardens at Kew and the Horticultural Society of

London. Both wrote and published largely—Hooker only upon descriptive botany, in which he greatly excelled, while Lindley traversed a wider field, and grappled with abstruser problems in every department of the science, always with confidence and facility, but not with unvarying success.'"

While Lindley is before us it may not be uninteresting to take another footnote given in the first chapter. He, having shown great zeal and ability as a local botanist, was invited to Halesworth with the view of encouraging him, and that he might there occupy himself in the translation of Richard's "Analyse des Fruits." He had been looking forward to employment as a botanical collector abroad, and this is the amusing incident: "The housekeeper at Halesworth finding that his bed was never occupied, after a vain search for a reason, reported the fact. His distressed host had to ask for an explanation, which was simply that his guest was inuring himself to the hardships of a collector's calling by sleeping on hard boards!"

We now return to the narrative. "As his own reputation advanced, so did that of his herbarium and library, which, before he had been ten years in Glasgow, were reckoned as amongst the richest private ones in Europe. This was due to his active correspondence, judicious purchases, the contributions of his former pupils, especially from abroad, to his methodical habits, and to the welcome he gave to all botanists who desired to consult his collections. For the operation of mounting specimens, &c., he employed aids, of whom I remember two; the first, in about 1827, I think, was a native of Dundee, a keen algologist, James Chalmers by name, who prepared fasciculi of named Algæ, in quarto form, in the disposal of which my father aided him. The other was Dr. J. Klotzsch, who spent some years as the Curator of the Herbarium. Klotzsch was an excellent fellow, a devoted mycologist, and whilst at Glasgow would study no other branch of botany but Fungi. . . . Returning to Berlin, he took up the study of flowering plants, acquired distinction as a botanist, and became eventually Keeper of the Royal Herbarium, Berlin. The only other aids my father had in Glasgow were my mother, as amanuensis, and myself; for, having been attracted to botany from my childhood, much of my spare school and college time was devoted to the herbarium.

"Very soon after the settlement of the herbarium and library in Glasgow, botanists from all parts of Europe flocked to it, amongst whom the following eight made the most frequent and longest sojourns, some of them becoming collaborators with the owner: R. K. Greville, G. Bentham, Sir J. Richardson, G. A. Walker-Arnott, W. Wilson, the Rev. M. J. Berkeley, H. C. Watson, and W. H. Harvey. Mr. Bentham's first visit was in 1823, from which occasion he dated his permanent adhesion to botany as an occupation for life. The next (in 1823) was Dr. (afterwards Sir John) Richardson, R.N., the companion of Franklin in his Arctic expeditions, through whom my father was made known to the Lords of the Admiralty, the Directors of the Hudson's Bay Company, and the chiefs of the Colonial Office, thus becoming the recipient of many herbaria made by the officers of these departments, and the author of works published under their authority. It further led to his being asked to recommend young medical men, fond of natural history, from amongst his pupils especially, to embark in their service abroad."

Numerous interesting associations and important acquaintances made in Scotland must be omitted, but let us take the following paragraph: "In 1828 my father first became acquainted with the Rev. M. J. Berkeley, of King's Cliffe, Northamptonshire, the mycologist, who was then, I believe, on his way to visit Captain Carmichael in Appin. This led to a very intimate friendship and repeated visits to West Park and Kew. Mr. Berkeley took the same interest in the Fungi of the herbarium as Mr. Wilson did in the Musci, and but for him this order of plants would never have attained its present pre-eminence; for his zeal induced my father to urge his correspondents in all parts of the world to collect fungi; with what success is shown by the richness of his herbarium, and the numerous papers on exotic genera and species of the order published by Mr. Berkeley in the botanical journals, in the 'Transactions of the Linnean Society,' and many other works. Mr. Berkeley also contributed the volume on Fungi to the third edition of Hooker's 'British Flora' (vol. v., p. 11, of Smith's 'English Flora'), and, dying in 1889, he bequeathed his herbarium to Kew, together with the choice of his botanical library.

"In 1830 Mr. Hewett Cottrell Watson, the most accomplished of British botanists, then resident in Edinburgh, requested permission to accompany the students of the botanical courses on an excursion to the Breadalbane Mountains, for the purpose of ascertaining the altitudes affected by their plants. Thus commenced a very active and interesting correspondence between my father and this acute botanist, which led to the publication of many papers in the journals conducted by the former, to the botanical expedition of the latter to the Azores, and indirectly to his valuable account of the flora of that interesting archipelago in Godman's 'Natural History of the Azores' (London, 1870). In 1831 Mr. W. H. Harvey, of Limerick (afterwards Professor of Botany in the Royal Dublin Society, and Keeper of the Herbarium, and eventually Professor of Botany in Trinity College,

Dublin), introduced himself by letter, with specimens from two new localities of a West Indian Moss (*Hookeria læte-virens*), found nowhere in the eastern hemisphere, but the south and west of Ireland. It was answered by an invitation to Glasgow, which resulted in an intimacy that amounted to his being regarded as a member of the family.

"I must not close this brief notice of my father's activity in encouraging others without an allusion to the solicitude with which he fostered my own aspirations to become a traveller and botanist; the interest he took in my ambitious projects; the energy with which he aided me in overcoming every obstacle thrown in my way, and prevailed on the higher powers to grant me facilities and the necessary funds; and last, but not least, the liberality with which he helped me whenever other resources were exhausted. In this connection I refer especially to four crises in my scientific career; my appointment to accompany Sir James Ross in the Antarctic Expedition in 1839 (for which he supplied all my scientific outfit); my (unsuccessful) candidature for the Professorship of Botany in Edinburgh University in 1845; my mission to India in 1847; and my appointment as Assistant Director of Kew in 1855. Add to these benefits the legacy of his herbarium and library, and the truth of the saying, 'One soweth, another reapeth,' forcibly applies.—[A Biographical Abstract compiled by Irwin Lynch from a Life-Sketch sent to the "Annals of Botany" by his Son, Sir Joseph Dalton Hooker, F.R.S., V.M.H., G.C.S.I., C.B., &c.—Journal of Royal Horticultural Society.]

## Societies.

### United Horticultural Benefit and Provident.

(17th Anniversary Dinner.)

This was held in London on Tuesday evening, Peter Barr, Esq., V.M.H., presiding over 111 members and friends. Mr. Barr read his speech on the toast of "The United Horticultural and Benefit Society." This was replied to by Mr. James Hudson. The other toasts following were: "The Honorary and Life Members," by Mr. A. J. Brown, replied to by Mr. Cox, of Hurst and Sons; "The Chairman," by Mr. C. H. Curtis; "The Visitors," by Mr. W. Woods, replied to by Mr. Thos. Bevan; "The Press," by Mr. Thos. Winter, replied to by Mr. R. Hooper Pearson. The speeches were commendably brief, and mostly to the point. A much appreciated musical programme was rendered by "The Amphion Quartette," which is well known at these meetings. The Society has now 1,040 members, 948 of whom are in England. The invested funds amount to £22,000. Messrs. Barr and Sons became honorary members, with an annual contribution of ten guineas, and Mr. Peter Barr gave five guineas. The meeting dispersed at ten o'clock, after singing "Auld Lang Syne," accompanied by three cheers. With greater space at command in our pages, we will next week give a fuller report. The Secretary's address is 9, Martindale Road, Balham, S.W.

### Royal Horticultural, Drill Hall, October 27th.

The Hall was again well filled with a very varied number of exhibits, Orchids being well represented, and, of course, Chrysanthemums. Fruit and vegetables were lacking. A paper on "Pruning Roses," sent by M. Viviani Morel, was read by the Secretary, Mr. G. Bunyard in the chair.

#### Fruit and Vegetable Committee.

Present: G. Bunyard, Esq. (in the chair); with Messrs. J. Cheal, G. Woodward, W. Bates, S. Mortimer, A. Dean, H. Esling, G. Kelf, H. J. Wright, G. T. Miles, A. G. A. Nix, J. Jaques, G. Reynolds, F. Q. Lane, J. Willard, G. Norman, G. Wythes, and A. H. Pearson.

Mr. T. Chamberlain, gardener to S. Heilbut, Esq., The Lodge, Holyport, Maidenhead, sent some very finely cultivated Celeriac, for which he received a cultural commendation.

#### Floral Committee.

Present: W. Marshall, Esq. (in the chair); and Messrs. H. B. May, C. T. Druery, G. Nicholson, R. Dean, J. Walker, A. Perry, J. Green, J. F. McLeod, W. Howe, G. Reuthe, J. Jennings, Chas. Dixon, J. A. Nix, Chas. Jefferies, C. J. Salter, W. Cuthbertson, C. E. Pearson, R. C. Notcutt, C. E. Shea, W. P. Thomson, E. H. Jenkins, Chas. Blied, Ed. Mawley, and Geo. Paul.

Messrs. Jas. Veitch and Sons, Limited, Chelsea, contributed a beautiful exhibit of their winter flowering Begonias, of which Mrs. J. Heal is certainly the most attractive. Agatha and Agatha compacta were well flowered. Julius and Ideala were the other varieties staged. The violet flowered Dædalæanthus varvus was attractive, as were some good plants of Salvia Pitcheri. Also a nice collection of Zonal Pelargoniums, in six-inch pots. The plants were dwarf, and carried excellent trusses of bloom. The most attractive were Dr. E. Rawson, Herrick, E. Bidwell, Mrs. G. Cadbury, Beauty of Kent, Mrs. Chas. Pearson, Iris, Ayesha, Erie, and J. M. Barrie.

From Messrs. H. Cannell and Sons, Swanley, came a fine display of Chrysanthemums of the Japanese, single, and decorative types. The Japs included good blooms of Alfriston, Camden, Miss Mildred Ware, and Mrs. F. S. Vallis. The chief singles were Lavinia, Victoria, Marguerite, Sunbeam, The Lion, and Paris Daisy. They had also a grand display of Zonal Pelargoniums exhibited in glass vases. The blooms were well up to Messrs. Cannell's standard, the chief being The Sirdar, Countess of Hopetoun, Princess of Wales, Duke of Norfolk, The Mikado, Mrs. Williams, Mrs. Ewing, Chaucer, Lady E. Malet, and Mrs. G. Cadbury.

Messrs. T. S. Ware, Limited, Feltham, reminded us that the Dahlia is still fresh, by making a fine display of single and Cactus varieties. The most attractive were Mrs. Reamsbottom, Negress, Miss Roberts, and Huntsman, in the singles; while the best Cactus varieties were Mrs. Ed. Mawley, Vesta, Alpha, F. W. Wellesley, Mrs. H. J. Jones, and Loyalty.

Hardy flowers from Messrs. W. Cutbush and Son, Highgate, were quite a feature. Alpine and rock plants were also arranged, and a nice collection of hardy Chrysanthemums. The latter included Bronze Prince, Sunshine, Martinmas, Lady Fitzwigram, and Golden Fleece. The herbaceous plants included Shortia galacifolia, Polygonum vacinifolium, Polygonum amplexicaule, and a good variety of Pentstemons.

Mr. W. J. Godfrey, Exmouth, staged sixty exhibition blooms of Japanese Chrysanthemums, with half a dozen incurved varieties. The most noteworthy were Miss Mildred Ware, H. E. Hayman, Lord Alverstone, Sensation, Mafeking Hero, F. S. Vallis, Exmouth Rival, and Colonel Weatherall. The incurved varieties were Devonshire Hero and Mrs. J. P. Bryee, a fine white form, that will be popular with exhibitors.

Messrs. W. Wells and Co., Limited, Earlswood, Redhill, arranged a large group of Chrysanthemums in pots, augmented with a large quantity of cut flowers, all sections being represented. The best Japanese varieties were Bessie Godfrey, Matthew Smith, Lord Alverstone, Mrs. T. W. Pockett, Miss Elsie Fulton, S. T. Wright, Pantia Ralli, G. H. Kerslake, Exmouth Rival, Mrs. G. Mileham, Maynell, Mrs. W. Duckham, Mersham Yellow, Mermaid, and Baden Powell. The singles were a representative collection, while the decorative section was particularly prominent, and included Carrie, Bronze Soleil d'Octobre, Nivette, Madame E. Caynard, and a few unnamed seedlings.

From Messrs. B. S. Williams and Son, Upper Holloway, came a miscellaneous display of stove plants and Orchids, including Dracæna Lindenii, D. Desmetiana, D. Bruanti, D. Vandendaeli, Kentia Fosteriana, and Rhopalæ coreovadensis. The Orchids consisted chiefly of Cypripediums.

A small collection of Carnations in pots was staged by Messrs. H. Low and Co., Bush Hill Park, Enfield. The most prominent were Norway, white; Cressbrook, rosy pink; Mrs. T. W. Lawson, earmine; and Queen Louise, white.

Mr. Norman Davis, Framfield, made a glorious display of Chrysanthemums, arranged most tastefully with Crotons, Palms, and Ferns. The large blooms included boxes of Mr. F. S. Vallis, Madame Carnot, Miss Mildred Ware, Madame Paolo Radaelli, Henry Perkins, Mrs. W. Mease, General Hutton, and J. R. Upton. Large vases were also filled with good exhibition blooms. The best novelty was Beauty of Leigh, a grand new yellow, and quite distinct. Decorative varieties were also employed to good effect.

Messrs. W. Bull and Sons, Chelsea, staged a table of new and rare plants, in which were noted Davidsonia pruriens, Ficus radicans variegata, a collection of Begonias of the Rex type, and Dracæna Goldiana.

From Messrs. W. Cutbush and Sons, Highgate, came a nice table of decorative plants of the foliage order, and included good plants of Dracæna Massangeana, D. Doueetti, Crotons in variety, Aralia elegantissima, and a variety of Palms, the front being formed with Ficus repens.

Mr. H. B. May, Dysons Lane Nurseries, Upper Edmonton, arranged a fine display of Dracenas, a few of the most striking being Lord Wolseley, Admiration, Madame F. Beryman, Nubian, Charmer, Ruby, Brilliant, Alsace Lorraine, Monarch, Mayi, and His Majesty. The entire exhibit included ninety species and varieties.

From Mr. G. Lange, Hampton, came a nice exhibit of winter-flowering Begonias. The plants were in six-inch pots, and were beautifully grown, the varieties being Gloire de Lorraine, its white sport "Alba," and Alba grandiflora, the latter being especially good.

From Messrs. J. Ambrose and Sons, Cheshunt, came a group of Roses in pots, which included Lady Roberts, Mildred Grant, Liberty, and Bridesmaid; also Lily of the Valley, cut Roses, Ericas, Cyclamens, Carnations, and a variety of other subjects.

Messrs. B. Ladham, Limited, Shirley Nurseries, Southampton, made an interesting exhibit of hardy Lobelias, which were very much varied in colour. The most attractive were Ruby, Cæulca grandiflora, and Fascination.

Mr. H. J. Jones, Ryecroft Nursery, Lewisham, made a bold display of Asters, pretty much in the same style as those ex-

hibited at the Crystal Palace. But the chief interest centred in his display of Chrysanthemums, which included large exhibition blooms, arranged in boxes in the usual way, and large vases filled with decorative varieties. The best of the large varieties were Maud du Cross, a grand new yellow; Lady M. Conyers, Madame Waldeck Rousseau, Master Seymour, Geo. Lawrence, Miss Mildred Ware, Countess of Harrowby, and F. S. Vallis. The decorative varieties included Howard G. Crane, Madge Blick, Captivation, Fleur de Jeunesse, Edith A. Cookson, and R. Pemberton.

#### Orchid Committee.

Present: H. J. Veitch, Esq. (in the chair); with Messrs. Jas. O'Brien, G. J. Fowler, H. Little, J. Wilson-Potter, W. H. White, H. A. Tracy, W. H. Young, W. Boxall, J. W. Odell, F. J. Thorne, M. G. Gleeson, G. F. Moore, F. G. Ashton, A. A. McBean, F. Wellesley, E. Hill, J. Douglas, J. Coleman, N. C. Cookson, W. Cobb, H. N. Pollett, de B. Crawshaw, H. Ballantine, and W. A. Bilney.

Orchids made a really grand display, and it is doubtful whether a finer display has ever been made in the month of October at the Drill Hall. Messrs. Jas. Veitch and Sons, Limited, Chelsea, arranged a glorious table, composed chiefly of Cattleyas and Laelias. The plants were beautifully flowered, a few of the best being Cattleya labiata, in fine form, C. Mrs. J. W. Whiteley, a grand form, Laelia Digbyano-purpurata, Laelio-Cattleya Nysa, and Cattleya Mantini made the chief display.

Mr. Ballantine, gardener to Baron Sir H. Schröder, Englefield, Egham, made a choice display, including Cattleya Gauthieri, Laelio-Cattleya Haroldiana, Cattleya Vigeriana, a beautiful form; C. labiata, Dell variety, a good white form, with a lip tinged with purple and a yellow veined throat. Noteworthy were also Odontoglossum crispum Sanderianum, Cypripedium Baron Schröder, and a well-flowered plant of Dendrobium Phalenopsis alba, carrying a fine spike.

From Messrs. Jas. Cypher and Sons, Cheltenham, came a choice exhibit, the chief features of which were the Cypripediums. The most notable were C. insigne Sanderæ, C. Lecanum virginale, C. insigne Harefield Hall variety (a very fine piece), and C. Ernesti. The exhibit also included some well-flowered plants of Cattleya labiata, C. Mantini, Oncidium Kramerianum (a very large form), also some well-flowered plants of Dendrobium Phalenopsis Schröderæ, and a curious plant of Cattleya x Fernand Dennis.

Messrs. Charlesworth and Co., Bradford, have a grand collection on this occasion, the chief features of which were Cattleya Mrs. Pitt, Cattleya Iris, a beautiful variety; C. Nestor, C.-L. Penelope. Other good plants were Brasso-Laelia White Queen, L.-C. Haroldiana, with a grand lip, also the hybrid L.-C. Haroldiana John Bradshaw.

Mr. Bound, gardener to J. Coleman, Esq., Gatton Park, Reigate, made a fine display of Cattleyas and other Orchids. In the former were noted C. aurea, a fine variety; C. labiata, C. Mantini, C.-L. Master J. Colman, Masdevallia Davisii, in fine form; M. cuculata, also some pretty plants of L.-C. Magnifica.

Mr. Alexander, grower to Captain Holford, Tetbury, also contributed a pretty table of choice plants, the most striking being Cattleya Mantini nobilior, C. Mrs. J. W. Whiteley, C. Fernand Dennis, C. aurea, and a nice collection of Cypripediums.

From Messrs. H. Low and Co., Enfield, also came a valuable contribution, which included good specimens of Oncidium Forbesi, beautiful plants of Phalenopsis amabilis, and P. leucorhoda, Cattleyas in great variety, including good forms of C. labiata, such as C. l. Pride of Southgate; C. Bowringiana, Low's variety; also Odontoglossum grande, and several Cypripediums.

Mons. A. A. Peeters, Brussels, staged a few good Cattleyas, two of which were honoured by the Committee, and are described in the awards.

Mr. J. Davis, gardener to J. G. Fowler, Esq., staged flowering pieces of Renanthera Lowi, arranged with Asparagus Sprengeri; the flowers exhibited a diversity of colouring. Mr. G. F. Moore, Chardwor, Bourton-on-the-Water, staged Cypripediums and Phallo-Cymbidium Charwardense. Sir Trevor Lawrence, Bart., Burford Lodge, Dorking, also set up half a dozen fine plants, one of which was honoured by the Committee (see awards).

#### List of Medal Awards.

FLORAL COMMITTEE.—Silver-gilt Flora to Mr. Norman Davis, Framfield. Silver-gilt Banksians to Messrs. Cutbush and Sons, Highgate; and Messrs. Wells and Co., Earlswood, Redhill, Surrey. Silver Floras to Messrs. Cannell and Sons, Swanley; Mr. H. J. Jones, Ryecroft Nursery, Lewisham; Messrs. Jas. Veitch and Sons, Ltd., Chelsea; and Messrs. T. S. Ware, Ltd., Feltham. Silver Banksians to Messrs. J. Ambrose and Sons, The Nurseries, Cheshunt, Herts; Mr. G. Lane, Hanworth Road, Hampton; Mr. H. B. May, Upper Edmonton; Mr. J. Russell, Richmond; and Mr. W. J. Godfrey, Exmouth, Devon.

ORCHID COMMITTEE.—Silver-gilt Floras to Baron Schröder, Englefield Green; J. Veitch and Sons, Ltd., Chelsea; Mr. J. Coleman, Reigate; Charlesworth and Co., Bradford; and Mr. J. Bradshaw, Southgate. Silver Floras to Hugh Low and Co.,

Enfield; Capt. Holford, Tetbury; and J. Cypher and Sons, Cheltenham. Silver Banksians to Mr. H. S. Goodwin, Putney; and Mr. Gurney Fowler.

#### Certificates and Awards of Merit.

*Begonia, His Majesty*.—A Rex hybrid, with blackish edging to seven of the veins diverging from the base. Wedges of bright purplish-red run in between these veins, the edge being of the same hues, and a metallic grey tint covers the rest of the surface. A.M.

*Begonia x Our Queen*.—A Rex hybrid, with leaves blackish chocolate in centre, edged the same colour, and having a bar of green about 1½ in from the edge, spotted with purplish-rose. A.M.

*Cwlogyne fuscescens* (Sir T. Lawrence, Bart.).—Bot. Cert. given.

*Cattleya Fabia* var. *Murie du Waverin* (A. A. Peeters, Brussels).—A sweet flower, with tricoloured lip. It is purple in the centre and on the upper edges, the middle of the sides being yolk-of-egg hue; the fringed front edge shaded to white. The sepals and petals are white. A.M.

*Cattleya F. W. Wigan*, Peeters' var. (A. A. Peeters).—Parents: C. Schilleriana and C. aurea. The bronzy-ruddy segments are recurved from the midrib, and very pretty. The lip is broad in front and coloured bright purple, with crimson-gold throat. A.M.

*Cattleya Gauthieri* (Baron Schröder).—Parents: C. Leopoldiana and C. Schröderi. The petals and sepals are pale creamy and mauve coloured; the lip bright mauve-purple in front, milk white backward. A.M.

*Chrysanthemum, Miss E. Holding* (W. Seward, Hanwell).—An incurved variety, coloured silvery lilac, and light purplish on the inner surface. A.M.

*Chrysanthemum, F. S. Vallis* (W. J. Godfrey, Exmouth).—A rich canary yellow Jap of good depth and size, with moderately broad recurving petals. It is now well known. A.M.

*Chrysanthemum, Maude du Cross* (A. du Cross, Esq., Canons Park, Edgware).—A very noble flower of enormous size, and yet it is full of grace. The colour is rich straw-yellow or sulphur, the florets incurving at the tips; these are broad. A.M.

*Dendrobium amplum* (Sir T. Lawrence, Bart.).—This has a black lip, and brownish, purple chequered segment. Bot. Cer.

*Erica gracilis nivalis* (Gregory and Evans).—A most profusely flowered form, the showers of bead-like flowers being nearly white. A.M. From Longland's Park Nursery, Sidcup, Kent.

*Laelio-Cattleya Haroldiana*, var. *John Bradshaw*.—Parents: L. tenebrosa x C. Hardyana. A large handsome flower with fine dark maroon-crimson lip, veined gold in the throat. It is wavy margined. The petals are broad and recurving purplish-bronze. F.C.C.

*Laelio-Cattleya Gottoiana Regale* (Sir Trevor Lawrence, Bart.).—A graceful flower, with rich glowing purplish-crimson lip, edged mauve. The segments are pale lilac-purple with bronzy overlay. F.C.C.

*Nephrolepis Westoni* (Cragg, Harrison, and Cragg, Merivale Nurseries, Heston, Middlesex).—A very graceful Nephrolepis of bushy habit, the fronds arching nicely, and the pinnae are moderately erected. N. acuta is said to be a parent type of this. A.M.

*Phallo-Cymbidium Chardwarensense* (G. F. Moore, Esq.).—A handsome showy bigener, with russet-bronze sepals and petals, and crimson lip veined with gold. The form and texture of the segments reflect the Cymbidium, but the foliage is like Phaius. F.C.C.

#### Paignton (Devon) Gardeners and Mildew.

The winter session of the Paignton Gardeners' Society for 1903-4 opened last Thursday, when the first monthly meeting was held in the Court Room at the Town Hall. The President, Mr. A. L. Spens, gave a brief but interesting and encouraging opening address, expressing his great pleasure at seeing such a good assembly of members, and especially at having some of the lady members present, and spoke on the general working and prosperity of the association. Mr. J. Crathorn (chairman of committee), who presided over the meeting, having given a general outline of the work of the session, called on Mr. A. E. Jefferies to open a discussion on "Mildew: Its Causes and Cures." Mr. Jefferies said Mildews were Fungi, members of a family extensive and diversified, interesting and beautiful; and whilst some were useful and enjoyable, others were tantalising, objectionable, and destructive. The family was so extensive that their name was legion; so diversified that they assumed all sorts of shapes, sizes, and colours. They were beautiful in form, texture, and colouring. The useful and enjoyable members were such as the Mushroom and Truffle, whilst the objectionable and destructive were the Mildews. He went on to show that these Mildew Fungi thrust their roots down into the pores of the epidermis, robbing the plant of its juices and interrupting its respiration; that they had the power of increasing by shooting or throwing off offshoots, and in this way they very soon wrought great mischief; that at a certain period in their existence these minute plants emitted myriads of seeds, which floated away, and, on alighting on suitable subjects, germinated and carried on the deadly work of destruction. He then gave a list of the subjects attacked by Mildews, and which more especially concerned the farmer and the gardener, viz., Wheat, Peas, Cabbages, Grapes, Peaches, Roses, Chrysanthemums, Orchids, stove plants, and many others, also mentioning a few of their friends.

## Young Gardeners' Domain.

### Marguerite Carnations.

These plants, I am of opinion, are not grown so much as they deserve to be. Few plants afford such a generous and useful display of flowers during the next two or three months in return for the treatment they require. Procure seed of a good strain, and sow in a fine, light, sandy soil in a well drained pan, early in March, and place in a temperature of from 50deg to 60deg F. So soon as the seedlings are large enough to handle, they should be pricked out into well drained pans containing the same compost as above, and these may be placed on a shelf in a cool house. In a month or five weeks they should be ready to pot singly into small sixties in a compost consisting of two parts fibry loam, one of well decayed leaves, and one of sharp road grit; and in removing the plants from the pans care should be taken not to injure more roots than necessary. Place the plants on a bed of ashes in a cold frame, and keep close for a few days, shading them from hot sun, and give water with discretion, and as the plants grow admit air more freely. When in a fit state, transfer to 32-sized pots and return to a cold frame, and keep close till established, after which remove to a bed of ashes in a sunny and open position. When the plants require it, tie them to a neat, well pointed stake. In the autumn the plants will commence to form their buds, and if the pots are well filled with roots the plants will need some nourishment. Soot-water is a good stimulant, with a change to guano, care being taken not to use too strong, as the roots are very fine and easily injured. If large blooms are desired, the plants can be disbudded. —E. B., South Berks.

### Malmaison Carnations.

Now, when Carnation layers are engaging attention, is the time when failures can be averted. They should now be all potted into four-inch pots, in a compost of two-thirds good fibrous loam broken very small, and the remaining third to consist of leaf soil, peat, and coarse grit in equal parts. See that good drainage is given. The layers should then be placed in a house or pit where they will secure full light, and if possible they should be on ashes, close to the glass. It will be found that failures are mainly due to overwatering, for the Carnation—or any plant of this type—should be dry before being watered; but in the dull, damp months of winter they are far better if kept dry for a few weeks. They should then be watered on a fine day, as early in the morning as possible, and repeat the operation when quite dry again. Air should be given freely, as, by keeping a moving atmosphere the plants will not be subject to the rust or spot disease to any great extent.

At the beginning of March the plants should be potted into five and six-inch pots, in a compost consisting of two-thirds good fibrous loam (yellow, if obtainable), the remaining third of leaf soil, peat, half-inch bones, and good coarse grit—no chemicals. They should then be put in a house where they can again stand on ashes. Sufficient moisture should come from the floor, as the plants ought not to be subjected to overhead syringing or to steam caused from wetting the pots or walls, and they should again have plenty of air. When showing bud, they will be benefited by an occasional watering with liquid manure or some fertiliser, if the plants are well rooted.—F. H. W., Journeyman.

["F. H. W." writes very well, and we shall be pleased to have occasional notes from his pen. He will certainly find the writing practice good in every way. We would ask him to leave half an inch space at the top of his letter for our use, and to allow a little more space between the lines and at the left-hand margin. —Ed.]

A Handy Flower Support.

The above can be easily made by perforating a piece of flat lead or copper, and then giving it the rounded form. Place this in a dish, and a flower support is prepared.

### Fruit Forcing.

**VINES: EARLIEST FORCED IN POTS.**—Many lovers of Grapes do not appreciate the thick skinned varieties, and desire thin skinned Grapes at all times. In that case it is better to take the early supply from Vines in pots than to start the permanently planted Vines at a very early period. Vines in pots produce fruit little inferior to that borne by others planted out, and often superior to that produced by those having the roots in inside borders, and always better than when the roots are wholly outside. Success in early forcing is more certain where there is convenience for affording bottom heat, the canes being sufficiently strong, plump-eyed, thoroughly ripened, and duly rested. The materials for affording bottom heat—such as two parts tree leaves and one part stable litter—should be in course of preparation. The heat to begin with must not exceed 65deg about the pots, augmenting it by bringing up the fermenting materials to the level of the pots by degrees, so as to raise the temperature to 70deg to 75deg when the Vines are in leaf. We advise the pots to be stood on pillars of loose bricks. Let the Vines be suspended over the fermenting materials in a horizontal position, to induce the buds to break evenly. Sprinkle the Vines three times a day, and damp every part of the house at the same time in bright weather. In order to ensure regularity of starting, a somewhat higher temperature is necessary at this period than later in the season: 50deg to 55deg at night and 60deg to 65deg by day is not too high to begin with. The Vines to have fruit ripe in April must be started early in November.

**EARLY FORCED PLANTED-OUT VINES.**—Those for affording fruit at the end of April or early in May should be set to work about the middle of November—not later. Thoroughly moisten, but not saturate to soddenness, the inside border at a temperature of 90deg, and in the case of weakly Vines supply liquid manure. This enriches the soil, ever conducting to a good break by the imperceptible ferment taking place in the soil, and by increasing the supply of food. If the border or floor of the house is covered with leaves and litter in a state of fermentation, occasionally turning the material and adding fresh, the moisture and warmth, also the ammonia-charged atmosphere, are very beneficial to the Vines, and make a considerable difference in the fuel used. The outside border must have a covering of leaves, with some litter or fern, sloping from the house outwards, and thus throw off some rain, as well as exclude frost. No roots can work in frozen soil. Fermenting material is not indispensable for placing on outside borders, but the warmth is a great aid in keeping the roots active and near the surface. Outside borders, however, are great mistakes for Vines that are forced early year after year.

**VINES FOR STARTING IN DECEMBER.**—Prepare the Vines and house for active service at the time stated, which is the latest to have Muscats ripe early in June and the early varieties in May. Prune the Vines directly the leaves have fallen. In pruning, two buds are usually sufficient to leave for securing compact bunches of Grapes. Finger pruning may be practised when the Vines are wanted to give fewer and larger bunches, for it does not answer to allow as many large bunches on a Vine, as of medium sized. Large bunches are as a rule loose, irregular in size of berry, and do not finish satisfactorily. Medium sized bunches are more regular in form and size of berry, and finish well. If the eyes at the base of the shoots are not plump, three eyes may be left, but this requires frequent renewal of the spurs. The Vines should be stripped of loose bark—indeed, all that can be done without stripping them to the live bark—and be washed with a tepid paraffin softsoap solution (4oz to a gallon of water). That is all that is necessary where the Vines are free from insects, and where there has not been mealy bug, scale, red spider, or thrips; but for these use a solution of caustic soda and pearl ash (1oz each to a gallon of hot water), applying with a brush at a temperature of 130deg to 140deg; it kills both hibernating pests and eggs. If troubled with fungous pests in previous growth, use a solution of sulphate of iron (1lb to one gallon of water), applying cold with a brush; but do not use both, the latter sufficing for both fungi and insects. The woodwork must be thoroughly cleaned—if necessary, painted—and the walls lime-washed, adding a handful of flowers of sulphur to each pailful of limewash. Remove the surface soil down to the roots, and supply fresh turfy loam with a nine-inch potful of bonemeal to each barrowload. Though a somewhat dry condition of the roots is desirable, the border must not be allowed to become parched and cracked, affording water if necessary, but not saturat-

ing the soil to the extent of making it sodden. Keep the house cool, admitting air freely, except when frost prevails. If the house is occupied with plants, employ fire heat only to exclude frost.—ST. ALBANS.

### Hardy Fruit Garden.

**PEACHES AND NECTARINES.**—These are not generally suitable for any position other than against warm walls, with a south or south-west aspect, fully exposed to sun. The soil must be well prepared, and free drainage afforded. It should be deep, and of a sandy, loamy character, with no manure added. The best trees to plant are fan trained, either as dwarfs or standards, giving them a distance of 15ft between each. They may be obtained from reliable fruit nurseries two or three years old, with an equal number of branches trained at a nice distance apart, of medium strength and healthy character, and possessing good fibrous roots. When obtained, keep the roots from drying, pruning away injured parts, and plant as soon as possible. The holes should be made wide and shallow, a depth of not more than six inches being the extent to which the roots should spread. Some of them may be three or four inches only from the surface. Lay them out to their full extent, and cover a few at a time with soil spread outwards from the stem. Make the soil firm. Only lightly secure the stems to the wall, so as to admit of the trees settling along with the soil. A little shortening of the shoots will be needed in spring. As a preventive against severe frost, spread over the roots a light mulching of manure.

**GOOSEBERRIES AND CURRANTS.**—The autumn planting of these, whether as bushes in the open or cordons against walls and fences, is almost certain to result in their making a strong and good start the following season. The reason for this is that they become partly well established by freely forming fibrous roots in the warm and fertile soil they find when planting early. Deeply dug and well manured soil must be prepared. They are upon the whole gross growers, and require a fairly rich root run. Over-luxuriance in growth does not, as a rule, result in unfruitfulness, especially if plenty of space is allowed the trees, branches are not overcrowded, and pruning generally judiciously carried out.

**RASPBERRIES.**—The ground for these, as for Gooseberries and Currants, may be prepared deeply, working in a liberal quantity of manure. Suckers are obtainable from between old stools, selecting those at a distance away, rather than immediately surrounding them, but the main thing is to see that they are furnished with plenty of fibrous roots, though the canes may to all appearances be weakly. Plant in rows not less than five feet apart, the suckers being placed two feet apart in the rows. A trellis should be fixed for training the canes to, two or three lengths of wire strained between posts being suitable. The highest wire may be at the height of five feet. There will be no fruiting the first season, as the canes must be cut down to the ground in early spring, in order that a strong growth may be made the first season.

**WINEBERRY.**—The Japanese Wineberry may be advantageously added to the usual selection of hardy fruits, growing a few rows in lines running north and south. Fix a trellis or wires, the same as for Raspberries. Prepare the ground, too, in the same manner. Insert the plants three feet apart in the rows, and cut down closely the first season. Train the young shoots to the trellis, giving them every facility to become well ripened by free exposure, and prevent crowding. The shoots made one season will bear fruit the next, hence the pruning mainly consists of cutting out the shoots that have borne fruit immediately the crop is over. The plants will repay good treatment, and may receive during the summer a liberal mulching of manure, as well as applications of liquid manure. The fruit is borne in sprays containing thirty or forty separate fruits of a clear, transparent wine colour, and of the size of very fine Blackberries. They are fully ripe early in September, and are not only good for eating raw, but excellent for preserving—altogether an excellent fruit to follow Raspberries and precede Blackberries.—EAST KENT.

**PUBLICATIONS RECEIVED.**—Toogood's "Culture of Hardy Tree and Bush Fruits," 6d. \* \* "Beautiful Flowering Trees and Shrubs," by J. Weathers, 6s. \* \* Prospectuses on horticultural teaching, by the following County Councils: East Sussex, Staffordshire, Hampshire, Northumberland, and Oxfordshire. \* \* Agricultural Scheme for Women, Lady Warwick College, Studley Castle, Warwickshire, price 6d. \* \* "The British Inventor," 1d. \* \* "Agricultural Economist," October, containing articles on Motors in Agriculture, Welsh System of Harvesting in "Windricks," Portraits and Notes (Right Hon. A. J. Balfour and Right Hon. Joseph Chamberlain). \* \* "Canadian Florist," Vol. I., No. 12, Toronto, 4s. 2d. per annum. \* \* "Le Moniteur d'Horticulture," Paris, October 10, with coloured plate of Iris Kämpferi varieties. \* \* "Floralia," containing coloured plate of Dimorphotheca Eckloni.

\* \* All correspondence relating to editorial matters should be directed to "THE EDITOR," 12, MITRE COURT CHAMBERS, FLEET STREET, LONDON, E.C. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense. In naming plants we only undertake to name species, or well-marked varieties, and only six on any one occasion. Florists' flowers we do not name.

**A QUERY.**—Our gardener has grown a vegetable which is new to us, called Asparagus Kale, and we shall be much obliged if you, or any readers of your valuable paper, can tell us (1) What part of it should be cooked? and (2) How it should be cooked?—E. F. T., Larkfield."

**SHOW BOARD FOR EXHIBITING CHRYSANTHEMUMS** (Inquirer).—The show board or stand for twelve blooms is two feet long, eighteen inches wide, six inches high at the back, and three inches in the front. The top is made of deal half-inch thick, and sloping sides three-quarter inch thick. The holes—three rows—are three inches from the back and front, and six inches between the rows and in the row, the distances being from centre to centre in marking for cutting the holes for the cups. The size given is that usually insisted upon at the principal shows, and known as "regulation" size.

**SHEEP ON CRICKET GROUND** (A. J.).—Unless the ground is unusually wet and the sheep are penned on the pitch, so as to practically kill the grass crowns, the sheep are an advantage, as they tread and manure the surface so that the grass grows better in consequence, is less liable to suffer from drought, and is better every way for the game. In a certain recreation ground the cricket table—some five or six acres—is kept constantly under the mowing machine, and the county club, who rent the ground, are annually grumbling about its being poor in grass and most annoying by the abundance of the White Clover—this, too, in this remarkably wet summer of 1903. Not half a mile away, and on higher ground—hence naturally drier—there are two cricket pitches in a large field, perhaps twenty acres in extent, and these are open to cattle and sheep from October to March inclusive. These pitches, separated from the remainder of grass during the cricketing season by moveable hurdles, and the grass enclosed kept under by horse mowing machine, are much better for the game than the county club ground referred to—indeed, they are everything the cricketer desires, not a complaint being made against the grounds, while in the other case the grumbings are often and loud—indeed, referred to in the local papers. As the season is so wet, it is matter for judgment as to whether the sheep should be allowed on the ground or not. If not likely to destroy the grass by folding in one place, the sheep will do good—at least, such is the case where we have seen them have the run, in the autumn and up to March, of cricket tables.

**STRAWBERRIES FOR FORCING, THROWING UP FLOWERING TRUSSES** (J. R. E.).—The damp weather is, perhaps, responsible for the Strawberries in pots, and intended for forcing, throwing up the trusses of bloom at this early stage, the plants being prompted to growth instead of resting and maturing the crowns by the moist and relatively mild autumn. In similar cases we have found it best to nip off the premature shows for bloom, as this only—or at least in our experience—occurs in the case of a crown here and there; and as there are generally other buds on the plant, these will push the trusses of bloom they have formed in embryo in due course. It is seldom, however, that the plants throwing up bloom prematurely give as good results when forced as those that have not started the crowns, especially the chief ones, in the late summer and autumn. Nevertheless, we have known them give useful fruit from the small or side buds. In some cases there are few or no side buds; then the plants, when the trusses showing in autumn are pinched off, give little beyond leaves. The plants sometimes only show the trusses in the crown, and do not develop beyond the extent of a flower or two. In such cases the plants should be kept as cool as possible, not pinching off the trusses, but plunging in ashes in a cold frame, air being given day and night, except when frost prevails, and drawing off the lights in mild and fair weather. The plants will make very little, if any, further progress, and a selection being made of all that have shown the trusses for bloom, these plants can be used for the earliest batches in forcing, say at the beginning of December, for affording fruit in late February or early in March.

**SMALL HOLDING WANTED (S. H.).**—"On page 344 of the Journal (October 8, 1903), in an article headed 'Small Holdings,' you mention a farm which is soon to be in the market. Allow me to ask where it is, and for any particulars you are able to give concerning it."

To this query our Farm Correspondent answers: "The farm in question (nearly 250 acres) was sold on October 10. If you really are a farm buyer, and, through the Editor, acquainted us exactly with your requirements, we would communicate with you (through the Editor), in case we heard of anything likely. Only large farms are ever sold cheap."

**NAMES OF FRUITS.**—Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number. (J. T. R.).—1, Cellini Pippin; 2, Washington; 3, Golden Spire; 4, Golden Noble; 5, Scarlet Nonpareil. (J. B.).—Canon Hall Muscat without a doubt.

**NAMES OF PLANTS.**—Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number. (J. P.).—1, Lonicera japonica; 2, Convolvulus Cneorum; 3, Tecoma radicans; 4, Sea Buckthorn (Hippophae radicans), male; 5, Ilex Aquifolium lutescens. (R. S.).—Catalpa bignonioides aurea. (F. N. P.).—1, Erica vagans; 2, E. ciliaris; 3, E. multiflora; 4, Arbutus Andrachne. (T. L.).—Callicarpa purpurea. (Orchidophile).—1, Stanhopea eburnea; 2, Calanthe Veitchi var.; 3, C. vestita luteo-oculata; 4, Oncidium crispum. (N. T.).—Zephyranthes candida. (E. J. W.).—Starworts or perennial Asters; the red is A. Novæ-Angliæ Mr. J. F. Raynor; the blue, A. Novæ-Angliæ sp. (Keay, Surrey).—Hibiscus syriacus fl.-pl.

## New Potatoes and the Disease.

It is such an universally recognised fact that the healthy life of every new variety of Potato has a fixed term, long or short, as it is of a hardy, vigorous nature or otherwise, and that if new seedlings were not continually introduced, the tuber could not be profitably grown. To those industrious and patient hybridisers, therefore, of which Mr. Clarke, the raiser of Magnum Bonum was representative of the past, as Mr. Findlay is of the present generation, both farmers and gardeners owe a great debt; whilst it is hardly

possible to estimate the benefit they have conferred on the teeming millions to whom the Potato is one of the cheapest, and in many cases the chief, article of diet. Whether it is owing to the fact that Potatoes are now more highly cultivated than they used to be, or not, there is no doubt that the useful life of varieties of recent introduction has been comparatively short. The Regent Tender, as it became in its latter years, enjoyed a fairly long popularity; so did the White Rock. Then we had The Champion, which saved the situation during, and after, the dire season of 1879; and it was immediately followed by the Magnum Bonum which held sway until Mr. Findlay's advent on the stage of Potato culture.

Except the Magnum, every new kind has been more quickly superseded than its predecessors, and this constant substitution of young and hardy stock is no doubt a chief cause of the great success which has attended Potato cultivation in this country. Hybridising has been adopted as a profession by many enterprising people—both firms and individuals—and the number of new varieties annually put on the market is almost bewildering. Considering the nature of the competition, the success of Mr. A. Findlay, of Markinch, N.B., is nothing less than phenomenal, and the striking point about it is its gradual, yet rapidly increasing progress. He gave us The Bruce, then Jeannie Deans, and Her Majesty; then Up-to-Date. The latter we thought would mark the limit of immediate improvement, but he has given us Evergood and Empress Queen, to show us that we were wrong; and now his Northern Star seems destined to beat all records, if it has not already done so. It certainly has beaten all records as a money-maker to the speculator. The three varieties just mentioned, with the addition of a coloured Potato named King Edward VII., are almost the only Potatoes talked about, although great things have been expected from another introduction from Markinch, named Royal Kidney, and a first early, Sir John Llewelyn. Well, wise men take for granted that all is not gold which glitters, and that it is not always the most talked-of Potato that eventually obtains most popularity, and it will be well to examine carefully the credentials of the new gold mines before taking shares in them.

The three necessary qualities in a new sort are: First, cropping powers; second, good table quality; third, hardiness. Many fancy kinds have been boomed and sold at high prices, which are now never heard of when put to the test of extended field cultivation; and put on the market they failed in some one or other of these necessary points. The disappearance of all the old varieties has been due to the loss in course of time of these qualities. The Regent succumbed to disease; the Magnum deteriorated in cropping power; disease was the factor in the cases of Sutton's Abundance, also Her Majesty and British Queen; whilst Reading Giant and Imperator were knocked out by the superior quality of Up-to-Date. So it has always been, and will be, and the question now is: Has the day of Up-to-Date gone by, and what will take its place? It is not sufficient to be a big cropper and sound. Will the great British public eat it? That is a question that cannot be answered here, but only by actual test on the markets. Our friends have been growing Royal Kidney and Sir John Llewelyn, and judging by their testimony, neither variety is likely to be much further heard of in connection with field culture, although the Sir John may prove useful for early work in the garden. Neither kind is free from disease, and both have another and bad fault, viz., want of size, under ordinary field conditions.

Fairy tales about Northern Star are numerous, and if we believed every word we hear, we might be inclined to put all our capital into a field of it. With every allowance for exaggeration, however, there can be no doubt that in the Potato Mr. Findlay has produced a wonder; for we can vouch for the following few records:—It will respond handsomely to the system of rubbing off the young sprouts and rooting them in pots, by which means a large number of plants (twenty, or even thirty) may be raised from one tuber. By this means a nobleman's gardener has this year grown 3cwt from 1lb. A shoemaker by the same system grew 1½cwt from 1lb. The difference in these two results might be owing to the greater facilities and superior technical knowledge of the gardener. Both these growers have sold their stocks at 1s. 9d. per lb.

Another speculator (this time a pork butcher) purchased 4lb and planted them on the single eye system. He succeeded in raising 3cwt, and is refusing an offer of £9 per

cwt for them. Another grower (a saddler by trade) planted 14lb, also on the single eye system. He produced 7½cwt, and sold them by auction, realising £108. The next example is that of a farmer on not very rich soil, who makes a speciality of the cultivation of new kinds of Potatoes. He had a plunge at Northern Star last winter and purchased 2cwt for £60. By planting these very wide apart, and cutting the tubers to single eyes, he made them cover half an acre, but he probably wasted some space. He has only lifted a portion, but estimates his total crop from the half-acre at 6 tons, half of which he has already sold, and he has 2 tons more to spare, the price being £180 per ton. He talks of planting the remaining ton, but may be tempted by price (a bird in the hand you know). We had the opportunity of seeing this gentleman's men lifting a plot of Empress Queen, and we were very much impressed by the weight of the crop and the fine size of the tubers. The owner seemed fairly well satisfied with them, but expects a better return from Evergood, which he considers a better cropper and quite free from disease, which he would not say for Empress Queen.

While speaking of the Evergood we may say that we have this day (October 20) tested our own crop of it, and had 420lb from 60 square yards—about 15 tons to the acre—and only noticed three diseased ones. This was on heavy land, over clay, and under ordinary field cultivation.

Our Northern Star farmer has grown Sir John Llewelyn, Royal Kidney, and Sutton's Ninetyfold, and has sold out all three, as he does not consider them suitable for field culture. We have two reports as to King Edward VII., and they agree fairly well in saying that it is a very heavy cropper, of large size; but it is coarse in shape this season, and then there is the colour against it. We have heard nothing of its cooking qualities. We have tried the flavour both of Empress Queen and Evergood and found both satisfactory, though we liked the Empress a little the better. Evergood is whiter in flesh, but not quite so floury, and rather wanting in Potato flavour. We suppose no one except Mr. Findlay knows the taste of Northern Star yet!!!

### Work on the Home Farm.

Better late than never; and at last we are favoured with a spell of fine weather (?). In ordinary seasons Wheat drilling would now be the general employment, but farmers have no time for that yet, though yesterday we saw a press-drill making excellent work. The harrows were covering the seed well, and it would be quite safe from both rooks and larks. Threshing has been so much delayed that machines are now working as long as light will allow, and all are booked until the end of the year.

A good deal of Barley has been knocked out this week, and we are glad to report that the early and well saved crops are turning out excellently, both as to quality and quantity. Crops which appeared but light are turning out 5qrs per acre, at from 30s. to 32s. per quarter, which is very satisfactory for the season. The demand for the best Barley is becoming very keen, but common lots are hardly saleable, which also applies to the Wheat market.

Farmers who are not threshing are lifting Potatoes, and with finer weather the work is much cleaner; but disease is more apparent than ever. Dealers are hanging about and offering improved prices, but insufficient to tempt sellers, who are too well occupied to care about delivering Potatoes yet awhile. So soon as lifting is finished, there will be a great sorting and restoring in the pics, but not many sales, we fancy. Half the crop is lost, but farmers mean to make their money out of the other half. The White Monarch Wheat we spoke of in a previous number has been threshed, and has yielded an excellent return, viz., forty-eight bushels. It is a Wheat we can strongly recommend.

The floods have been very bad for steam cultivation. We found our cultivator men, a day or two since, helping a neighbour to thresh. They state that their engines and tackle have been stranded in a low and wet situation for three weeks, and they will probably not be able to get them out until severe frost sets in. They have orders to last them a year, so their case is truly a trying one; but it is quite as unfortunate for the farmers, who need their services and will have to wait until the proper season for the work is past.

Rams which have been with the ewes three weeks should now be marked with a different colour (black or blue), so that the early lambing ewes may be distinguished later on. Where more than one ram is used, it is a good plan to let them change places, as it makes the farmer more secure of a successful lambing.

No opportunity should be lost of mating cows and heifers with the bull, so that they may calve during the autumn months, when there will be the greatest demand for the young stock.

## PLANTING SEASON

## PAULS' ROYAL NURSERIES

WALTHAM CROSS, HERTS.

12 miles from London. South Entrance four minutes' walk from Waltham Cross Station; West Entrance three minutes' walk from Theobald's Grove; both Stations on the Great Eastern Railway.

## SPECIALITIES:

**ROSES** in all forms, from open ground and in pots. Gold Medals in 1903 from Royal Horticultural and Royal Botanic Societies.

**FRUIT TREES** for the Orchard, Garden, and Forcing House. Hogg Memorial Medal, 1901.

**HARDY TREES** for Streets, Parks, and General Planting. Silver Medal from Royal Agricultural Society of England.

**SHRUBS**, both Evergreen and Deciduous.

**CLIMBING PLANTS**, Hardy and Greenhouse.

**RHODODENDRONS, CAMELLIAS, & AZALEAS.**

**HERBACEOUS PLANTS** in great variety.

**BULBS and SEEDS**, and all Garden Sundries.

PRICE LISTS ON APPLICATION. INSPECTION INVITED. Upwards of 1000 Medals, Prizes, and other Awards at leading Exhibitions during the past 42 years.

## Point Judging.

THE "pointing" system of awarding prizes has had a fair trial, and in some particulars it has undoubtedly proved not to be the solution of the all-absorbing question to exhibitors of garden produce—an assurance that judgment is correct. Moreover, when it fails, and the points credited by adjudicators are presented to the inspection of the public, it renders the system as a whole ridiculous, which it is not; and if the names of the judges are added, it places them in the position of recording a mistake, which afterwards they might be glad had been sunk in oblivion.

A superficial study of the method might lead one to suppose that, provided as the judge is with a comparative list of the numbers each fruit, vegetable, or flower is worth at its best, there is little opportunity left him to make wrong awards, or at least to produce a schedule of misleading points. As a matter of fact, the numbers provided for his guidance are of no value whatever, and they are in practice used merely to record the judgment arrived at in his own mind while examining the material placed before him. The standard of judgment must invariably reside in the mind of the adjudicator, and all his judgments are founded on that standard alone, numbers, on his part, being employed solely to give expression to an opinion of his own, and not to a standard outside himself, inflexible and unchanging, by whomsoever used. But that is not all. The standard that a judge bases his judgment upon to-day may be a different one from that he will use next week. It is one of the peculiarities of the human mind that its judgments are invariably comparative; its standard of efficiency, of quality, of beauty even, cannot be depended on as unchangeable, and, as a

READERS are requested to send notices of Gardening Appointments or Notes of Horticultural Interest, intimations of Meetings, Queries, and all Articles for Publication, officially to "THE EDITOR," at 12, Mitre Court Chambers, Fleet Street, London, E.C., and to no other person and to no other address.

matter of fact from the nature of its constitution it is constantly in a state of flux. The heat of a scorching summer is supposed to exceed in its intensity that of any previous summer; the glory of an autumn sunset to surpass in its beauty any seen before. The one can be estimated by no known method; the other, tested by science, shows that the conclusion of the moment is not supported by fact.

As with a sunset, there is no means in existence of testing the correctness of point-judging. The experienced onlooker is, no doubt, able in a few minutes to estimate the correctness of the award, but that is quite another thing from deciding as to whether the number of points have been accorded correctly. If he demurs as to the infallibility of the judges in a particular instance, and is supported by the unanimous opinion of others, it is very certain that the points submitted as a basis by these authorities are in general opinion valueless. That is an extreme case which, though extreme, is not without its examples.

Perhaps in nothing is the futility of pointing more apparent than in those instances where a passing glance, as it were, is sufficient to determine which is the better; yet the judges are obliged to allocate to each dish its proper number of points, and if in anything the system may be made ridiculous it is surely here, when, after a lengthy discussion, the sum total of points brings out a curious closeness in quality between two collections that are in fact very widely apart.

Thus far it has been assumed that judges have possessed as nearly as the human mind will permit of, a uniform standard. As a matter of fact, no such thing exists. A gardener in the South of England acquires a widely different idea of what constitutes perfection in hardy fruits or in vegetables from the northern practitioner. The latter may produce, according to the exigencies of climate, a dish, say, of Cox's Orange Pippin culturally of equal value with the very greatly superior examples of his southern confrère, but would it be right to give them points of equal value, and, if not, on what basis can the judgment of the northern judge be disputed? Or we may take as another instance that of a dish of Onions produced anywhere in Scotland or the North of England. No care, combined with utmost skill, can possibly produce bulbs of equal dimensions with those grown in the sunny South. Is it right to judge each on its merits? If so, it is impossible to mete justice to both.

This brings us to another phase of the question. If there is to be a general standard it ought to be one that can be attained by at least the greater part of the cultivators in Britain, or, on the other hand, there ought to be strictly defined lines of demarcation, beyond which the cultivator favoured of climate cannot pass. The R.H.S. gives its sanction to this in offering separate prizes for hardy fruits produced in counties differing in latitude; but once that theory of climate is materialised it is not sufficient to stay at Apples and Pears: it ought to be extended to hardy vegetables as well, while our northern societies might do worse than follow the initiative of the R.H.S., and sectionise their schedules in the same manner.

I have merely touched on a few of the outstanding features of these phases of exhibiting. Of pointing as a means of aiding judges to arrive at a correct decision in cases where the competition is close I have nothing but praise. The system of making it compulsory and public is quite another thing, and of very doubtful benefit. — R. P. BROTHERSTON.

#### Science at Wisley.

At the R.H.S. Scientific Committee's meeting, held on Tuesday, October 27th, Dr. Masters drew attention to the desirability of the Society utilising the Wisley garden for scientific investigations in addition to the requirements of horticulture proper. He invited suggestions from members of the committee. It was recalled that recommendations had already been laid before the Council, but they had not seen their way at the time to consider the proposals favourably. Mr. Worsdell suggested communications with foreign horticultural institutions to gather hints of their methods, which might be turned to account. He would maintain that the scientific director should be a broad-minded man, and not merely a specialist; one who had a good knowledge of botany and practical horticulture. He thought a start should be made in a humble way, only such instruments being obtained as the need arose for them. Mr. Masec mentioned the following examples of objects worthy of further investigation, which should be undertaken; The silver-leaf disease, the gumming of Hyacinth bulbs, as well as what may be the causes which render some sorts of Potatoes immune from the disease, &c.

## Making a Garden.—I.

Sooner or later the generality of gardeners have to undertake either the alteration of gardens and grounds, or the entire planning, planting, and placing of new gardens in toto. These facts are known from the first year of the gardener's career, and the true recognition of them causes an aspiring man to set seriously to work and master the studies that garden making involves. The construction of a garden does not necessarily imply landscape gardening, for there is little of that nowadays in the United Kingdom, albeit landscape gardening is an everyday phrase; but at times the work of planning and arrangement may be on a scale sufficiently elaborate to entitle the undertaking to be designated landscape gardening. What the scope and pretensions of this magnificent art and calling is can be found on reference to Mr. H. E. Milner's book on the subject, or to Mr. T. H. Mawson's "Garden Making," as well as "Gardens, Old and New," from the "Country Life" Library. Of course, there are smaller books dealing with the making of gardens, but unfortunately they are not easily procurable. Mr. W. Robinson's "English Flower Garden" may be in part taken as a guide to the strictly informal landscape gardening school; while in direct antagonism to this is Mr. Reginald Bloomfield's "Formal Gardens in England."

In the present series we begin the publication of what should be an exceedingly valuable course of papers, for young gardeners especially, and in order to prepare the way for later descriptive articles on the divers features of garden making, the primary work in the art of construction—that of plan drawing—is detailed hereunder.

#### Plan Drawing.

Of the many and widely diverse methods of occupying his spare time, I can conceive none more profitable to the young gardener, nor more productive of real enjoyment, than plan drawing. The aim of these notes is to engender in the young men a desire to possess a self-drawn plan of the gardens in which they work, and to put them in the way of converting that desire into reality; and as one who has done the work himself, and whose handiwork (be it said without egotism) has invariably secured the unqualified approbation of his employers, I can promise all who take the matter up, with a determination to overcome every obstacle, that they will never regret it, and will in after years regard the time spent as among the most pleasurable of their lives. But on the threshold of the subject let me dispel any doubts they may entertain as to its simplicity, by affirming that they must be prepared to make many small sacrifices and bring into requisition a large store of strong common sense before they can present to the critical eyes of their employer or the admiring gaze of their comrades an accurately described and neatly executed plan.

If any authority be required to endorse my opinion, I have it in the person of Mr. A. Dean, whose name is so well known to readers of the "Journal." I have no recollection of the words he used, nor the occasion which evoked their utterance, but I well remember making a mental note of the fact that he commended the practice of drawing to scale the plan of a garden. If my memory has so badly served me that I have misrepresented him, he will, no doubt, quickly correct me.

I have stated in effect that this exercise of plan drawing is both useful and interesting. I would firstly advise my comrades to examine their conscience as to their knowledge of arithmetic, unless they wish to mar their pleasure by a near approach to arithmetical desperation. The work also necessitates at least a slight knowledge of the principles of geometry, whether acquired through the aid of a text book or the result of our own reasoning powers. Mensuration must also be called into requisition, not only in measuring the land, but likewise when the plan is drawn, in discovering the different areas. Needless to say, an acquaintance with these sciences is of incalculable advantage to every gardener, whether he follows the majority and becomes head of an establishment, or undertakes the fascinating and alluring art of landscape gardening.

Again, we find its utility manifest when alterations are about to be made, because we can then have before our eyes an exact representation of the present state of things, and can study them in their relation to the proposed improvements, and that at times—for instance, the long winter evenings—when it is impossible to bestow the same amount of consideration to the question on the spot. Moreover, it is most useful—and was recently advised by a practical gardener in a contemporary—to have at hand a plan of the kitchen garden, so that we may study the location of the crops during the previous year, and so arrange those of the coming season as to ensure a regular and healthy rotation.

Thus far as to its usefulness; and if proof be required to show the exquisite enjoyment to be obtained both during the certainly tedious task of measuring and drawing, and after the completion of the plan, I would ask our intending surveyor to conjure up an idea of the honest pride he will feel in displaying his modest work of topography to the head gardener or to his employer, the

owner of the place; and in after years, when his plan will have become timeworn, let him again imagine and enjoy, now by anticipation, some of the pleasure arising from the friendly eulogies bestowed on this specimen of art, a safe index in itself of a resolute mind.

In the desirable event of my words having some effect on young gardeners in arousing their ambition and stimulating them to a praiseworthy effort, the following practical suggestions will be found useful. The necessary implements are few and simple, and include a tape measure 66ft, with the links and poles marked on the reverse side, a stout rod about 10ft in length, two or three balls of strong tarred cord, some pegs, and a notebook and pencil. Armed with these, and replete with a good stock of strong common sense, and not a little patient perseverance, our "surveyor" may issue forth on his peaceful enterprise with a full certainty of overcoming every difficulty.

I am well aware that the tape measure is regarded with suspicion by men who have a thorough knowledge of the subject, on account of its susceptibility to atmospheric influence, but I advocate it rather on the score of expense (an important consideration for the majority of those who it is wished will profit by this essay), being less cumbersome and more easily manipulated than the chain; and if the plan drawer makes no more enormous mistakes than would represent the possible inexactness of the tape as compared with the chain, he will have much on which to pride himself. If he will be advised to refrain from using it during wet weather and over damp grass, the inaccuracy will be reduced to a minimum. The cord will be required to form a base line when measuring irregular outlines, and the rod will present a more expeditious method of taking offsets from this than the tape.

Once the good resolution is made, and before metrical operations can commence, it is essential to ascertain the approximate extent of the ground to be included in the plan, in order to discover the most suitable scale to which to draw it. This may be found by roughly stepping the greatest length and breadth, counting each step a yard and adding ten to each number to allow a sufficient margin for any error. According to the estimated extent of the place and to the limit of size which we desire the paper containing the plan should be, must the scale be regulated. For instance, if the estimated maximum length be 500 yards and the breadth 280, and it be desired not to exceed the "double elephant" size drawing paper (40in by 27in), a most convenient scale would be two inches to the chain, or, what is nearly equivalent, 1-32 of an inch to the foot. It is certainly preferable for beginners to use as large a scale as practicable, not only because it is easier for themselves, but also that they may more clearly figure the details; and I strongly urge the use of the chain and links system, as in casting up the areas—presuming the drawer is acquainted with decimals—the work is greatly simplified.

The area being known in square links, and 100,000 of these equalling an imperial acre, it is only necessary to point off five decimal places, and the figures to the left of the point are acres. Should it afterwards be desired to find a given length in lineal or square feet, this may be done by multiplying the links by 0.66 in the former case, and in the latter the square links by 0.4356.

Having procured the measuring instruments, decided on the scale to be employed, and obtained the paper and other drawing requisites, our next consideration is to determine on a base from which to commence operations. As most kitchen gardens form a rectilinear, if not a rectangular, figure, it will be found useful to take the measurements from this. Find out the direction the walls take with regard to the compass, and endeavour to so arrange that a straight line drawn from top to bottom of the paper will be precisely north and south and at the same time parallel to the sides.

When the kitchen garden is accurately measured and drawn—and accuracy here is of prime importance—proceed outward, and as soon as possible get to the boundary and draw along the outside of it a line whose position relative to the kitchen garden is precisely known. The idea then should be to find out and figure on the plan the whole of the boundary thus forming the outer shell, which we may at once fill in by locating the position of all buildings, since they will greatly aid us in discovering the situation of other portions of the garden, the outlines of which conform neither to the run of the ruler nor the sweep of the compass.

In measuring an irregular outline the best plan is to run a line of tarred cord as near to it as possible, and to fix pegs along it opposite every indentation and projection, and having found their distances from the starting point, find also their distances perpendicularly from the fence, treating the spaces between each of these discovered points in the boundary as straight lines. Of course, the greater number of offsets taken, the greater will be the accuracy of the work. When a marked curvature occurs to such an extent that the first cord line would be too far distant to ensure an accurate measurement, or it would be impossible to continue taking perpendicular offsets from it, it is evident that another line must be drawn departing from a convenient point in the original. To transfer this line to the map we must gain an idea of the angle it forms with the o r.

Now, measuring the angle with an arc is likely to engender grave error unless proper instruments are used. A way which I have found to be at once simple, convenient, and accurate, is to form a triangle (preferably an isosceles) by joining by a straight line, and at a convenient distance from the angle, the departing line and the produced portion of the original. Thus, if we measure off twenty-five links of each from the angle and find these two points to be seventeen links asunder, we must describe on the corresponding base (twenty-five links) on the plan a triangle having its sides equal to the scale of twenty-five and seventeen; and in this way we discover the direction taken by the new line. On the same principle we may ascertain the location of a tree. Presuming the tree to be within reasonable proximity to a straight walk, we should mark off a suitable portion of this for a base, and from each extremity measure the distance to the tree, which will figure on paper as the apex of the triangle. This principle is based on the seventh proposition of Euclid, which affirms that: On the same base and on the same side of it there cannot be two triangles having their sides terminating at one

*Sarmienta repens.* (See note below.)

extremity of the base equal to one another and likewise those terminating at the other extremity.

The most difficult part of the measuring business is probably in obtaining accurately the outline of a lake or pond. For this it is better to describe around it a rectilinear, though perhaps necessarily multilateral, figure, corresponding as nearly as possible to the form of the lake. In doing this, however, endeavour to be scrupulously exact in taking the angle, as an error to the extent even of half a link will often throw the whole thing wrong. From the lines of the figure drawn a number of measurements will enable us to form a fairly accurate plan of the sheet of water. I would advise all novices at the work to draw each night the measurements they have taken, thus obviating the danger of accumulating a medley of figures.—WM. ROWLES.

(To be continued.)

**SARMIENTA REPENS.**—The woodcut shows this neat little Gesneraceous, warm-greenhouse plant. The charming scarlet flowers are shown about natural size. They are of inverted vase shape, hanging in scattered numbers, and make objects of rare beauty. The stems are wiry and ramble somewhat in growth. Propagation is by cuttings, which are difficult to root, but the plant well repays attention. A suitable soil consists of three parts fibrous peat and one part sphagnum, with sand and charcoal; and at Kew the plant is grown in Orchid baskets and the same house as the *Vandas* and *Phalænopses*. It enjoys plenty of water and a warm, moist atmosphere, moderate shade also being necessary.

**Oncidium Gardneri.**

The figure of this very attractive Orchid came to us from Mr. Charles Jones, gardener at Ote Hall, Burgess Hill, Sussex. We quote the description and remarks made with reference to it in Watson's "Orchids and Their Management":—"A handsome species, with moderately large flowers, very near *O. Forbesi* and *O. curtum*, from which it differs in the form and crest of the lip, and in having very small column-wings. It has oblong-ovate, furrowed pseudo-bulbs, 2in to 3in long, and dark green, rather broad leaves, which are purplish on the under side. Flower-spike long, branching, many-flowered; sepals and petals 1in long, broadly ovate, with short, stalk-like bases, the margins wavy; shining brown, with yellow edges; lip kidney-shaped, 1½in across, very wavy, with two small basal lobes; colour bright yellow, with broad blotches of brown in a ring round the margin. The flowers, which last several weeks, are produced in summer, about July, and are fragrant. Placed on a teak raft or in a basket, in the cool house, this species grows well and flowers annually. It is found wild on forest trees on the Organ Mountains, in Brazil, whence it was introduced in 1843."

**The Week's Cultural Notes.**

*Angraecum sesquipedale* is not in all cases a success, and I am of opinion that the winter treatment meted out to it is often the cause of the trouble. Too much atmospheric moisture at a time when days are short and dark is not at all to its liking; and if there is a dry, warm corner in any of the houses where the specimens of this unique species can be accommodated, they ought to be placed there. In one well-known Orchid nursery they used always to be placed in the centre of the *Cattleya* house, at a point where the hot water pipes turned at right angles, so that nearly double the amount of heat radiated from them, causing a drier heat in winter.

These plants were remarkably healthy, well furnished with leaves to the surface of the compost, and they flowered magnificently every year. There is something in the appearance of the grey-green, hard-looking foliage of this plant that suggests a dry atmosphere, and collectors tell us that in Madagascar there are two distinct types of plants—one growing exposed to sun and air on the top of the tallest trees, the other in hot, shady valleys. Although the latter grow much more luxuriantly, and are leafy and green, they never flower with anything like the freedom that the exposed plants do. This should be a cue for thoughtful cultivators.

Of a different character is the bulky growing *A. eburneum* and its beautiful variety *A. e. superbum*. These are free flowering in the extreme, and nothing seems to injure their health provided they have ample heat and moisture all the year round. *A. e. virens* is not so vigorous, and I have had more difficulty with this than either the type or *A. sesquipedale*. Considerable care is needed in the treatment of the small growing sorts, of which *A. modestum* is a well-known example. Their treatment is more like that recently described for the dwarf *Phalaenopsis*, both at the roots and in the atmosphere.

Anguloas, and other deciduous kinds of a similar habit, must be kept well on the dry side now and until the new shoots appear. A shelf near the glass suits them well in a temperature akin to that of the Mexican house. *Catasetums* and *Cynoches*, resting Chysis, and West Indian *Oncidiums* must have more warmth, but all like the light, and none of them need any more moisture than will keep the pseudo-bulbs plump. Any plants, of course, that have not quite finished growing, will be treated accordingly and given water in lessening quantities until the last leaf falls. —H. R. R.

**Notes on Vandas.**

*Vanda Amesiana* is a plant that delights in sun, being found in exposed positions in the Shan States. Cool treatment is best, but not the same conditions under which *Odontoglossums* and similar Orchids thrive. The Mexican house, or a position close to a ventilator in a house where *Cattleyas* thrive, is better. As a rule, specimens of this delightful species are made up by placing four or five stems in a flattish receptacle, but single-stemmed plants are best in small baskets suspended near the light. It has thick leathery leaves, and flowers at various times during the year upon loose spikes, the flowers being very fragrant, white, with a rosy suffusion on the sepals and petals, and a deep rose lip. A pure white form has also been described.

Of quite a different character is *V. Batemani*, a stately plant, growing 6 feet or more in height, bearing immense spikes of bright yellow blossoms, spotted with crimson and violet-purple,

springing in a semi-erect position from the upper portion of the plant. It is only suitable, of course, for large houses, but in these it is a noble addition to any collection. *V. Bensoni* grows freely in any tropical house; is about a foot high, and bears large erect spikes of flowers. These are white on the reverse of the sepals and petals, yellow inside, dotted with red-brown, the lips with a rich violet centre.—H. R. RICHARDS.

**Sir William Jackson Hooker.**

(Concluded from page 405.)

"The works published by my father when in Glasgow are very numerous. A complete list of them, with details regarding the more important, will be given at the end of the sketch. They may be grouped under four headings: British Botany, American Botany, Miscellaneous Works, and Serials.

"In the British Botany there was the 'Flora Scotica,' the new edition of Curtis's 'Flora Londinensis,' four editions of the 'British Flora,' and many contributions to a knowledge of British plants in the volumes of his botanical journals." Numerous other works under the classificatory headings mentioned above are then enumerated.

"In the same year (1827), finding that his extensive correspondence with botanists and travellers abroad provided him with information of great value that might otherwise never see the light, and that his herbarium was at the same time teeming with plants unknown to science, my father formed the plan of himself editing a periodical for the diffusion amongst botanists of the information obtained from these sources. As a model he took König and Sims's 'Annals of Botany,' of which two volumes only had been published (London, 1805-6). He never stopped or stooped to calculate the time, worry, and cost that this undertaking would entail upon him, which occupied him for the next thirty years of his life; for he had throughout no assistant editor, and was dependent solely on my mother, and at intervals on myself when at home, for aid in proof-reading, &c. The heavy correspondence it entailed was conducted by himself alone.

"Including the continuation of the series issued from Kew, these periodicals embrace twenty-eight volumes with 548 plates, of which seven volumes with 247 plates, the greater number of them drawn by himself, were issued from Glasgow. These were the 'Botanical Miscellany,' three volumes with 152 plates (1830-3), the 'Journal of Botany,' two volumes with 44 plates (1834 and 1840), and the 'Companion to the Botanical Magazine,' two volumes with 51 plates (1835-6). In the interval between the publication of the 'Companion to the Botanical Magazine' and the resumption of the 'Journal' he undertook the editorship, with Sir William Jardine and others, of Taylor's 'Annals of Natural History,' which for three years (1837-1840) was the recipient of much of his botanical matter; but the latter became too copious to be included in the numbers of the 'Annals,' and, the result proving otherwise embarrassing, that editorship was abandoned.

"After leaving Glasgow for Kew he resumed the 'Journal,' three volumes (1840-2) of which were followed by the 'London Journal of Botany,' seven volumes (1842-7), and that by the 'Journal of Botany' and 'Kew Garden Miscellany,' nine volumes (1849-57). . . . As a contribution to the history of botany during three decades of the nineteenth century these periodicals were unique; no period or subsequent decade of that century can show so rich a store of valuable botanical material.

"Towards the end of his Glasgow life my father resumed a systematic study of Ferns, which he had begun with Greville soon after his arrival there, the first result of which was the commencement of an 'Enumeration of all known Ferns' published in the 'Botanical Miscellany.' The issue in parts of Hooker and Bauer's 'Genera of Ferns' was begun in 1838; it originated in his having been shown the beautiful analyses of many genera of the order by the veteran botanical artist, Francis Bauer, who offered the loan of these for publication to my father; not that the Order had in the meantime been neglected by him, as is proved by the numerous genera and species described and figured in his journals, in the 'Icones Plantarum' and other works, and by his publication of J. Smith's 'Genera of Ferns.' As I propose to give in an appendix to this sketch of his life a complete account of my father's works, I shall not dwell here on those devoted to Ferns."

The concluding chapter of Mr. Lynch's abridgement of the biography records incidents in Sir William Jackson Hooker's tenure of office as Director of the Royal Gardens at Kew (III. West Park and Kew, 1841-1865), during which period the gardens were changed from nothingness to what they are now. When he accepted the commission, the Treasury looked upon these gardens only as a drain upon finances, and only the earnestness of strong-minded scientists saved them from reduction, if not oblivion. Sir William Jackson Hooker died on Saturday, August 12, 1865, in his eighty-first year.

## The Liliaceæ.\*

The Natural Order Liliaceæ comprises over 2,500 species, the major portion of which are natives of the temperate regions; thence, although they can scarcely be defined as eurythermal, i.e., living in every climate, yet it would be a mistake to describe them as stenothermal, restricted to few climates. Like man, they are divided into well defined tribes and families, each of which is social, and occur in gregarious groups. Some families, viz., *Lilium*, are nearly cosmopolitan; whilst others, again, are endemic, and true to the region of their birth.

For the most part, the species have in their floral organs a distinctiveness entirely their own. The Amaryllid type, which most closely resembles them, are readily distinguished by their inferior ovary. The forms of their floral leaves are extremely varied, and to convey an impression of this character we cannot do better than quote Ruskin's eulogy to ordinary leaves, which he says are "Linear, oblong, ovate, acute, fimbriated, stalked, sessile," and so on, and so on; in fact, to accurately describe the modifications of the Liliaceæ would necessitate the use of nearly all botanical descriptive terms. The only fault with the flowers of some genera is their short period of freshness, flowering for a week, then fading for ever.

The leaves of most of the genera are developed contemporary with the flowers, or more or less after them. We have persistent leaves, as in *Draena*, *Yucca*, and *Cordylina*. Phylloclades in *Ruscus*, *Asparagus*. Their venation is usually unicostate and parallel, but is reticulate in *Philesia* and *Lapageria*. The majority are acaulescent (bulbous, &c.), but caulescent (stem-producing) forms, as *Cordylina*, &c., also occur. So likewise do climbing stems, as in *Asparagus* and *Lapageria*. Their fruit is either capsular or baccate (berry-like), but baccate fruits and bulbous rootstocks never occur in any one species.

The cultural requirements being so greatly determined according to the structure of their rootstocks, it may be well to give them a few moments' consideration, confining our remarks on bulbous forms to the tribe Liliæ.

### THE TRIBE, LILIEÆ.

Firstly, we have the perennial rootstock with fleshy and fibrous roots, as in *Anthericum* and *Tritoma*, which, having no definite resting period, must not be kept out of the soil for any length of time. Secondly, the bulbous forms—a very useful class of plants—which can be removed from the soil, and stored in an airy chamber during their quiescent period, whilst their place is occupied by other plants. Of this class we have various forms. Firstly, the squamose perennial bulb, as represented by the Old World species of *Liliums*. From the under side of the bulbs a mass of fleshy roots are produced, and from the upper side the flowering stem of the year. The basal portion of the stem—that between the surface of the soil and the apex of the bulb—in some *Liliums* gives off copious fibrous roots, which are the chief feeders of the flowering stem. This underground portion of the stem is usually vertical, though in *Lilium Leitchlini* it will creep half a foot, so that, if grown in a pot, and the bulb is planted in the middle, the stem will spring from the side of the pot.

All the scales of the bulbs possess the power of producing new bulbs in their axils, and will do so, in some species at any rate, if the bulb is broken up. Thus, with both bulb and seed production, the skilful operator may in four years multiply his stock fifty-fold. A new bulb, however produced, either by seeds, scales, or bulbils, takes three years to produce a flower stem. The first year we get an ovoid mass, a quarter of an inch thick, of six imbricated scales; the second year a bulb the size of a Hazel Nut; and the third year probably the flower stem, while

the bulb lives on indefinitely, shedding off some scales annually from its circumference. In two Californian species, *Washingtonianum* and *Humboldtii*, this type is departed from, being modified by the central axis of the bulb becoming prolonged horizontally, so that the scales are thrown out of their spiral arrangement, and the bulb is more or less flattened irregularly. Here we get a squamose bulb taking the first step to pass off in the direction of a rhizome.

In most Fritillarias we get a well marked type of structure. Take the bulb of *F. Meleagris* at the time of flowering. This we find as follows: In the centre, the flower-producing stem, with no stem roots. Tightly pressed against the sides of the base of the flowering stem are two hemispherical scales, half as thick as broad, rounded on the outside, and flat on the inside. These are the bases of single leaves, alike in character, and not at all flattened in structure. From the summit of each, before the development of the flower stem, there arises a leaf which dies down before the flower is produced. In the autumn these produce buds in their axils, from one of which the flowering stem of the future year is produced. This type of structure is scarcely varied through half the species, and is known as the tunicated bulb (the same as in Onions). In the

American species there are no outside tunics, and the scales are numerous, small, and granular, *F. pudica* being an exception, as its bulb closely resembles the European species. *F. imperialis* and *F. persica* have squamose (scaly) bulbs, for which reason they were once classed as *Liliums*.

In the third class we have an annual tunicated bulb. This form runs (with much modification as regards the number, thickness, and persistence of the tunics) through *Lloydia*, *Calochortus*, and *Tulipa*. In *Tulipa*, the outer tunics are brown and leathery, the inner ones thick and fleshy. By the side of the old stick-like stem and the developed bulb may be traced the embryonic bulb of the following year; so that the bulbs are really in their third year when producing flowers.

In *Calochortus* the structure is similar, but the inner tunics are fewer and the outer thinner. In the section *Gageopsis*, of *Lloydia*, we have a fourth modification of this structure, viz., a tunicated corm. Here the flowering stem is nursed and nourished by the modified base of a single leaf, which leaf is fresh and green at the time the floriferous stem is developed from the top of the corm. Thus we see that throughout the tribe *Tulipæ* the bulbs, the cycle of whose existence is from one to three years, develop new bulbs in the axils of their scales. In a perennial squamose bulb the old bulb remains, and a new bulb is developed in its centre.

In passing from our superficial description of rootstocks, it possibly may be instructive to allude to one point worthy of notice in their root structure, that in agreement with other Monocotyledonous plants, the roots have no secondary tissue, a complete absence of cambium, the entire structure being developed from the growing point once and for all. Hence it is obvious that in transplanting or otherwise interfering with active roots, every care must be taken not to break them, for if the tip (which is the growing point) be removed, no further growth can ensue, and the root decays entirely.

To give a description of all the species in this Order would necessitate the production of a lengthy paper. The genera to be treated here are not chosen for any special merit, and in consideration of the botanical element in our midst, they are treated in their genetic arrangement.

(To be continued.)

**BLACKBERRIES IN LINCOLNSHIRE.**—Blackberries were never so abundant in Lincolnshire as they are this year. The hedges are literally covered with them, and huge quantities of the fruit are being gathered and sent to the towns, where they are fetching as much as 6d. a pound in the market.

*Oncidium Gardneri.*

\* A paper read before the Kew Gardeners' Guild by Donald MacGregor.

### Pentstemon, Newbury Gem.

I note with surprise (p. 296) that Mr. Arnott says this Pentstemon is now scarce. Hereabouts, thanks to Messrs. Ladhams, of Shirley Nurseries, it is plentiful, but not more than its merits deserve. With me it stood outside in a border of stiff, cold soil, unprotected in any way. The same plants have flowered in abundance this year. It is quite a desirable variety for filling bare places in the herbaceous border, or for making an edging to taller sorts in beds or borders. From cuttings it is easily propagated like all Pentstemons.—E. MOLYNEUX, Southampton.

### Scottish Horticultural Association.

(Prizes for Cut Chrysanthemum Blooms, 1903.)

Following up the remarks made by "Interested" on page 401 of the "Journal," I have no hesitation in saying that if a vote of the members were taken now, a huge majority would be against the Council. I think it is altogether absurd that £36 10s. should be offered in one class which is confined to Edinburgh growers. I await with interest the statement of those members of the Council who voted for it, and I am pleased to know there were some against giving so large a sum. I expect this will be the first and last year of such absurdity, and that is our consolation.—ANGLO-SCOT.

### The Recent Gardeners' Dinner.

To the committee that organised and carried through so satisfactorily that great and very successful festal gathering, the best thanks of everyone who was present are not only due, but are, I feel sure, most sincerely and heartily accorded. Not the least satisfactory result of the voluntary and much appreciated services of the committee is, that the balance of the accounts is on the right side; and the information that the committee has given it to two such excellent institutions. It is sometimes said that, in this life, there is no pleasure without a tinge of disappointment and sorrow. In this instance the tinge (and the only tinge that I am aware of) was occasioned by the absence of those two great friends and supporters of gardeners and gardening, Mr. Leopold de Rothschild and the Very Rev. Dean Hole, and also of those two old and highly esteemed friends, Mr. J. Hudson and Mr. J. Smith, both of whom had served on the committee. The former was absent through illness, and the latter by the stern, ruthless hand of death.—T. CHALLIS, The Gardens, Wilton House.

### The Colouring of Apples.

This is a most interesting subject, and one which opens up the possibility of the expression of distinctly conflicting opinions. "W. S.," on page 380, states his case very clearly, and his ideas are very much in accord with my own. That the "cold snap" spoken of by correspondents has a direct influence upon the colouring of fruit is more than I can accept without greater proof than has as yet been offered. If the cold of autumn is directly responsible for the colouration of Apples, how comes it that with few exceptions all those sent us from hot climates are far more brilliant than our own? One might go further and say that those grown in the warmer counties are always better coloured than those grown in colder districts. There is no doubt in my mind that the "cold snap" affects the chemical nature of the soil, and the consequent colouring of the fruit is in some way analogous with the maturing of, and colouration in, foliage in autumn.—PROVINCIAL.

Let me ask your correspondents who hold that rain helps the colouring of Apples whether the "rosy" side of the fruit is not always towards the south or one of its quarters whence sunshine comes? It seems to me that when fruit colours after much rain has fallen in the autumn, it is in spite of the rain rather than because of it. The Apples could not colour fully till they reached maturity, however sunny the weather might be, and when they became nearly ripe they began to colour well, in spite of rain. Shaded Apples do not colour properly, however much rain there may be.

It is not at all unlikely that a touch of frost helps to colour the skin of the fruit, just as it colours the foliage. But has not soil as much to do with high colour as anything? There is a good deal of iron in my soil, and my Apples colour brilliantly when there is enough sunshine. But they did not colour nearly as well during the past season of flooding rains as in the years of drought previous to 1902. They coloured better in 1902 than in 1903, because there was more sunshine in the autumn.—SUNNY SOUTH.

### Finances of the Royal Horticultural Society.

Pessimism is rife in reference to the financial position of the Royal Horticultural Society. Pessimism, however, may be regarded as a "hardy perennial." What is the position of the Royal Horticultural Society in its money matters? If it is not all that could be wished, it nevertheless is not such as need cause anxiety. The new hall is to cost £40,000. Of this sum about £25,000 has been promised, and much of it paid. Supposing that no further sum is collected, the Society has at the least £16,000 of invested capital, drawing interest meanwhile. It is said that those £16,000 may not be touched for the hall, owing to a bye-law of the latest Charter. If this be so, it is decidedly unfortunate, and the question will be, Can the bye-law not be qualified so that £15,000 might be employed to capitalise the hall, leaving still £1,000 to the good, which, with £5,000 for the surrender of the Chiswick lease, would give a nucleus of £6,000 with which to begin operations on a small scale at Oakwood? The Society has also an annual income of from £5,000 to £8,000 (which may reasonably be expected for some years, in any case). Judiciously managed, this sum must surely meet the necessary expenses; and so, Where is the difficulty?—LONDON CITIZEN.

### A National Potato Society.

I am exceedingly glad that "our Journal" has opened its practical columns to a discussion of this important question.

I observe that two out of the three letters published on page 401 are strongly in favour of the scheme, and the third is by no means hostile. With respect to the suggestion that the duty of developing and protecting the Potato on the lines I propose should be taken over by the Royal Horticultural Society, permit me to point out:

(1) That the Society is now closely engaged with two gigantic undertakings—the new hall and the new garden—and therefore has its hands very full.

(2) That the very essence of the work which I and those in association with me have at heart is simultaneous trial on all sorts of soil. Trials at one place alone, however well conducted, would not suffice.

I hope it is scarcely necessary to say that the establishment of a National Potato Society would not be in any sense antagonistic to the R.H.S. Special societies have a sphere of influence of their own, subordinate to, and in reality a support of, the wider operations of the great Society. New societies come into being from time to time, but the R.H.S. does not grow weaker, it grows stronger. I do not think that the operations of a National Potato Society need be so costly as some may fear, because I believe that the county education authorities would facilitate them. I may add that I have just completed a pamphlet bearing the title, "Potato Perils," and intended as a fairly full case for the establishment of a National Potato Society. It is now in the press, and will be ready shortly. A copy will be sent to the Journal, and to any applicant; but as there is no committee as yet, and no funds, the cost of printing falls entirely upon myself. Perhaps, therefore, correspondents will kindly enclose 1½d. in stamps when writing.—WALTER P. WRIGHT, Postling, Hythe, Kent.

### Dahlias: Good Wet Weather Flowers.

Outdoor flowers have suffered so severely by the continuous rains that any flower that can endure the ordeal, and yet present a wealth of fresh flowers and unblemished colours, deserves more than a passing notice. A call at Heywood, Wiltshire, recently revealed to me clearly the great value of Dahlias for making effective borders, and giving sheaves of flowers suitable for vases. With the development of early Chrysanthemums there may not appear the same desire or purpose for Dahlia blooms in the house; but those who have to maintain a regular and frequent supply of fresh flowers in a cut state will readily admit that the Dahlia season, advanced as it is, still provides acceptable material. If anything, I think the fresh, clear, and bright colours are enhanced by the quieter tones of the Chrysanthemums; and as an outdoor flower, at the time of my inspection of the Heywood Dahlias, they were certainly grander than the border Chrysanthemums. Mr. Robinson, whose name has so long been familiarised with exhibition Chrysanthemums, does

not now, nor has he for some years past, allowed the "stage Mums" to altogether monopolise his attention; but this year's display of Dahlias eclipses those of former years, because of the novelties on view. I ought to say that the Cactus section are those favoured in this instance.

The end of October is certainly not a date when such a large, bright, and varied wealth of colour could be expected, nor would it be possible had the slightest frost paid an early autumn visit. As the meteorological observers incline to the opinion that a cycle of wet seasons is pending, it would be as well to remember and emphasise the importance attached to Dahlias, especially for the autumn, and particularly in wet, dripping seasons. They appear to revel rather than languish in continuous showers. Spring struck plants, and new varieties, seem to give the best results.—W.

### The Colours of Leaves and of Fruits.

The subject of the variation in the colour of plant leaves and of fruits, especially Apples, has occupied the attention of scientists for many years, and has been found to be one of great difficulty. Sachs says that among the changes caused in plants by long continued depression of temperature, one of the most striking is the change in colour of leaves and of fruits. This change is of two kinds; the leaves either merely lose their colour and become brownish, yellowish, or rusty brown, or turn a decided red on the upper surface. The loss of colour of the first group depends, according to Kraus, on a change in the grains of chlorophyll, which lose their form and definition, a cloudy mass of protoplasm of a reddish brown or brownish yellow colour being formed, while the nucleus remains colourless. These changes are usually more complete on the upper side than in the parenchyma, which lies deeper.

The winter leaves of the second group, which are coloured red or purplish brown on the upper side, owe this colour to a rounded, hyaline, strongly refractive mass lying in the upper cells, which appears of a beautiful carmine red where the leaves are red, but elsewhere of a pale yellow, and consists mainly of tannin. The red colouring matter is soluble in water, and cannot be distinguished from the red colouring substances of flowers and fruits. In all leaves which persist through the winter it is found that when the weather has become sufficiently warm in the spring, the normal condition is restored; the red colouring substance disappears, and the grains of chlorophyll again take up their normal position on the cell walls. Kraus shows that the winter change of the leaves depends on the fall of temperature, since it is restored to the normal state by a simple rise in the temperature, whether in the dark or in the light. It may be remarked that in the present season leaves are slow to assume their usual autumnal tints, owing to the continued moist and mild weather. With the lowering of temperature and a slight frost during the past week, the leaves quickly put on their beautiful yellow and red tints. A single severe frosty night frequently suffices to bring about the change in the form and colour of the chlorophyll grains. The writer has been informed by Mr. A. D. Hall, Director of the Rothamsted Experimental Station, that at Wye College, during the past three years, special experiments have been carried out with Apple trees treated with various artificial manures, with a view to determine their effect upon the colouring of the fruits. It has been found that manures have little, if any, effect upon the colouring of Apples. Mr. Hall is of opinion that the red skin colour is entirely due to a sudden lowering of temperature.—J. J. WILLIS, Harpenden.

### A Hint for the R.H.S.

I observe that advice is freely being given to the R.H.S. re what it should and should not do at Wisley. Laboratories for research, large ranges of glass for experiments in hybridisation, and many other suggestions are forthcoming in abundance. Now, I notice we have a "Metropolitan Fellow," page 381, anxious for the Society to obtain models of Apples and Pears. This may appear to be very feasible advice to those not well acquainted with the vagaries of these fruits; but to those who know something of fruit growing and to those who attended the fruit show recently held at Chiswick, and there noticed the remarkable difference in the same variety of Apple, brought from different districts, this advice may justly appear of doubtful utility. Apples and Pears not only vary in different counties, but they vary in neighbouring gardens, and to such an extent as to be quite unrecognisable. On one occasion I knew a gardener make a wager that he would gather three Apples from the same tree, and send them to an authority, and that each Apple would receive a different name. The Apples were sent away, and three names were returned. I simply mention this to show the difficulty of preparing models. For certainly one cast of each variety from any district in England would be of very little use.

I am aware that certain varieties vary very little, viz., Peasgood's Nonesuch cannot be well mistaken. True, it is some-

what like a really good sample of Blenheim Orange sometimes. Or we may take one or two of the Russian Apples, Duchess of Oldenburg, for example. This is a very distinct and unchangeable fruit. When looking over the Apples at Chiswick, I was interested at the great difference in the shape and colour of Cox's Orange Pippin. It is quite possible that if half a dozen of these fruits had been carefully selected and placed before some of our highest authorities, they would have received several names. Therefore I think that a single model of any variety of Apple or Pear would be useless for future comparison, and several would cause confusion. Seeing that there are at least 600 varieties of Apples alone, known to cultivation, it would be no small matter financially to prepare a single cast of each. At present, however, it seems that the R.H.S. is, after all, not over-burdened with cash, for, I observe that in an article in a contemporary on the Wisley garden, the writer easily finds use for £10,000. A large proportion of this large sum is absolutely necessary before the staff can settle there, for the building of the necessary residences and other offices, to say nothing of glass structures. This together with £15,000 still wanting for the completion of the new hall, is a big sum to collect by voluntary contributions. I think, therefore, we will have to exercise patience for our hobbies.—T. ARNOLD, Cirencester.

### Akebia quinata.

There is something very attractive about this old, almost hardy climber, which, I think, ought to give it a place in every collection. In Scottish gardens it is, if not a *rara avis*, at least a plant of very limited distribution. The five-fingered leaves, were these its only merits, are quite sufficient to make it an object of no ordinary decorative value for conservatory pillars. The racemes of beautiful purple flowers, which are abundantly produced, are very fragrant as well as ornamental, and suspend in copious masses among the picturesque foliage. The delicious aroma impregnates the whole atmosphere of a house. The plant is a native of Chusan, and probably of Japan, for we read that the Japanese use the plant for medicinal purposes. It is not quite hardy in the North, as at one time it was supposed to be; but it is said to survive in favoured parts of South Britain, West of England, and Scotland, with protection. [Which is true.—Ed.] It can be multiplied by the ordinary means, viz., division and cuttings, and thrives best in a compost in which a dash of good fibrous peat obtains.—D. C.

### Large Potatoes, and a Heavy Crop of Apples.

Notwithstanding the universal untoward nature of the past summer, large Potatoes seem to be greatly in evidence. In some places we find a single specimen weigh as many as 26oz. The eating qualities, of course, in such cases cannot be expected to be proportionately satisfactory. As far as size is concerned, it would seem that abundance of moisture is not undesirable for the Potato; at the same time, we heard good cultivators of this essential food supply say that the crop can well afford to do without moisture, provided it gets a good drenching after being earthened up. No more is needed till the crop is gathered in. Disease is not so bad northwards as had been expected. I have seen several samples of the big Potato this year, and not later than last week, being on a visit to the gardens of Trinity Grove, Edinburgh, where they were at the time busy digging their crop. The kind was Up-to-Date, and for size, abundance, and regularity could not be beaten. I was also considerably astonished to see there such a heavy crop of Apples. The trees were literally groaning under their heavy loads, and they were nothing to what they were last year. I was told by Mr. McKenzie the dearth of all kinds of fruits so generally felt throughout the country was not in the least experienced there. The early summer frosts which proved so disastrous in most places clearly had little effect on blossom or vegetation there, probably on account of the proximity to the sea, as well as the garden's well sheltered situation.—D. C., Hamilton.

[It is pleasant to hear of the continued fruitfulness of the Apple trees at Trinity Grove. The soil there is almost pure sand on a gravel subsoil, and it is not overfed; nevertheless, there is an annual plethora of fruit, particularly from Stirling Castle, Ecklinville, Lord Suffield, and Ribston Pippin. Every tree, however, crops well; it is their fertility that keeps them fertile—which is neither paradox or pun. Mr. McKenzie finds many of the trees apt to become hide-bound, and he used to enjoy (!) ripping them open by longitudinal cuts. The immediate expansion of the bark before the knife was interesting to observe; indeed, no pressure was needed, for the bark burst asunder. Save that the crevices that followed the cutting formed a harbour for American blight, no harm or damage was done. From the heavy annual crops obtained, it would appear to be all for good. These trees (with which we have had practical experience) are on cultivated vegetable ground.—Ed.]

# NOTES & NOTICES

## Croydon Horticulturists.

At the rooms, Sunflower Temperance Hotel, George Street, a goodly assembly of members on Tuesday, October 20, listened to a highly practical paper on "A Year's Work in the Vinery," read by Mr. W. Taylor, Tewkesbury Lodge Gardens, Forest Hill. The next meeting is on Friday, November 6, when Mr. R. B. Leech, Wood Hall Gardens, Dulwich, will lecture and demonstrate on "Fruit Bottling," and to this lecture the lady friends of members are invited.—H. B.

## Royal Horticultural Society.

The next Fruit and Flower Show of the Royal Horticultural Society will be held on Tuesday, November 10, in the Drill Hall, Buckingham Gate, Westminster, 1 to 4 p.m. A lecture on "The Advantages and Evils of Size in Flowers, Fruits, and Vegetables" will be given by Mr. E. T. Cook, F.R.H.S., at 3 o'clock. At a general meeting of the Royal Horticultural Society, held on Tuesday, October 27, thirty new Fellows were elected, making a total of 1,236 elected since the beginning of the present year.

## Newport Gardeners' Association.

The following syllabus has been arranged:—October 14: Mr. J. Basham, Bassalleg, "Hardy Fruit, Past and Present." October 28: "Functions of Leaves," by Mr. J. Reece. November 11: "Wonders and Curiosities of the Vegetable World," by Mr. J. Pegler, hon. sec. November 25: "Notes on the Great Fruit and Vegetable Show at Chiswick," by Mr. C. Basham. December 9: "Six Good Vegetables," by Mr. J. Lee, of the Bristol Gardeners' M.I. Association. December 23: "The Duties of a Qualified Gardener," by Mr. J. H. Jarvis. January 13: "Culture of the Cucumber," by Mr. Waller of the Cardiff Gardeners' M.I. Association. January 27: Lecture by G. Brookes, of Clifton. February 10: "Culture of the Tomato," by Mr. H. Woodward. February 24: "Grapes without Fire Heat," by Mr. J. Kenward. March 9: "Gardeners' Friends," by Mr. Reeves, Crindau. March 23: "Salad Plants, and How to Grow Them," by Mr. F. S. Daniels. April 13: "The Herbaceous Calceolaria," by Mr. J. Wiggins. May 11: To decide upon the Outing. June 8: "Achimenes, and How to Grow Them," by Mr. D. Powell. July 13: Open. August 10: Annual Meeting, election of officers, &c. September 14: To consider the rules, &c.

## Notes from Newton Mearns, N.B.

Since I last wrote, on October 12, we have had thirteen days of wet weather; but the 23rd was an exceptionally fine autumn day. With such a fine day (Friday) the farmers had an early stir on the Saturday morning, and before daylight many were to be seen out in the fields preparing for the ingathering of the remaining tattered grain; but, alas! no sooner had they started when they were compelled to cease. It is a question if it is worth taking in now. In many places corn which has not been cut yet is standing in about a foot of water. The leaves still cling in much profusion to the trees, and the Hawthorn hedges still show fresh and green by the roadside; others are exceptionally pretty, especially the Rowans, which are clothed in their golden attire. The garden is getting emptier day by day. There are still a few Chrysanthemums showing, and Dahlias that were fortunate enough to escape the last spell of frost are yet giving good blooms; but of all, there is nothing to surpass the Rose. Here, out in all various climatic conditions, the Rose blossoms. It is very encouraging, even in times of despair, to see such remarkably fine blooms of Gustave Piganeau, Captain Hayward, Mrs. Harkness, Oscar Cordel, Ulrich Brunner, Victor Hugo, Marie Baumann, Mrs. Sharman Crawford, and Mrs. John Laing. The Hybrid Teas are giving their third crop, and extra blooms of Goldelse, Pribislan, Frau Peter Lambert, Prince de Bulgaria, Mrs. Grant, Lita, Testout, Killarney, and President Carnot, are to be seen. The Teas are now gone: this weather does not suit them, and it has been a very bad year for the ripening of the wood.—N. R.

## Obituary: Mr. G. Summers.

We have to record the death of Mr. G. Summers, Stoke Gifford, Bristol, which occurred on Saturday last, at the age of eighty-five years. A few weeks ago he was knocked down by a cyclist, and the shock was too much for him. To his son, Mr. G. Summers, of The Gardens, Sandback Park, Rotherham, and family, we extend respectful sympathy.

## Malton (Yorks) Floral and Horticultural Society.

The forty-fourth annual meeting of this society was held recently. Last year's show merely paid its way. The financial position of the society has been unsatisfactory for some time. Since the last show the several committees had met and went through the sections of the show, and had come to the conclusion that a much more attractive gala might be held if ordinary prizes were altered. Amongst other items by which the prize money would be reduced would be to discard the large specimen plants, as the public did not appreciate them so much as formerly. The secretary, Mr. Thos. Wray, who had held this position for forty-three years, retired. The chairman, on behalf of the committee and subscribers, thanked Mr. Wray for the way he had always carried out his duties. Mr. Wray was elected as the first honorary member.

## The Small Holdings Association, Limited.

The first annual inspection of the estate of the Small Holdings Association, Limited, at Cudworth, near Newdigate, Surrey, was held on 17th September, when there was a large gathering. The primary object of the association is the repopulating of the country with cultivators of the soil. The trustees are Sir James Blyth and Mr. J. H. Whiteley, M.P.; the directors are Messrs. J. Tomkinson, M.P. (chairman), J. Spear, M.P., S. R. Whiteley, and James Long (managing director); with Mr. H. B. Long, B.Sc., as secretary. The estate, which is about thirty-one miles from London, has been acquired for the purpose of supplying small holdings of land to selected persons who intend to live upon and cultivate it. Areas of from three to twenty-five acres are offered for sale; the land is specially suitable for garden farming and arable purposes. Purchasers are required to pay down 10 per cent. of the cost price, and the balance in half-yearly instalments extending over ten to fifteen years, with interest at 5 per cent. The cost varies from £20 to £30 per acre, and arrangements can be made for the erection of houses on similar terms to the purchase of the land. The colony is occupied by a number of skilled men, and the success of the project is assured by the system of co-operation introduced by the association.

## Reading Gardeners' Association.

The last fortnightly meeting of the above association was held on the 26th ult., and was very largely attended, upwards of 100 members being present. The occasion was the visit of a representative from the Bristol Gardeners' Mutual. Mr. J. H. Vallance was the member selected, and he chose for his subject "The Renovation of Old Vines." His paper was full of interest and of original ideas in the carrying out of the work. Minute details were given as to the lifting of the trees, replanting, soil, manures, and treatment of the young canes. Some of the methods of procedure met with adverse but pleasant criticism, and a lively and animated discussion followed, in which Messrs. Barnes, Hinton, Wilson, Turnham, Neve, Exler, Pole-Routh, Prince, Fry, Alexander, Judd, House, and Stanton took part. A hearty vote of thanks was accorded to Mr. Vallance for his excellent paper, and for the most interesting evening he had afforded the members. In replying, Mr. Vallance and Mr. Groves, the hon. sec. of the Bristol Society, both expressed the wish that the interchanging of lecturers between the two associations would last for many years. There were two or three fine exhibits, honorary, fourteen dishes of Apples, the fruits large and of splendid colour. The most noticeable varieties were Warner's King, Lane's Prince Albert, Stirling Castle, New Hawthornden, Cox's Orange Pippin, King of the Pippins, and Fearn's Pippin. These were staged by Mr. E. Fry, The Gardens, Greenlands, and he was congratulated on having such fine fruits in so bad a season. Three plants of well grown Clerodendron fallax, raised from seed sown in May, by Mr. F. W. Exler, The Gardens, East Thorpe. For certificate, six dishes of splendid fruits of Warner's King Apple, entered by Mr. H. House, The Gardens, Oakfield (certificate awarded), and Impatiens Sultani, by Mr. E. S. Pigg.

#### Spring Bedding.

Where preparations have to be made for a display of bloom next spring, it will be advisable to lift the plants which have done duty throughout the summer as early as possible. The soil should then be dug and the beds made ready to receive the plants. These will include such as *Myosotis*, Wallflowers, *Polyanthus*, *Aubrietias*, spring flowering *Phloxes*, *Arabis*, especially the double variety, *A. alba plena*, which is very effective used in this way, *Primroses*, &c. Any surplus plants which are not required in the beds can be placed about in the shrubberies or flower borders, where they have a very pleasing effect, *Myosotis* especially, and if planted in good patches by the side of water or in a damp spot these will succeed admirably.

#### Choice Bouvardias.

At the latest Drill Hall meeting Mr. H. B. May contributed a beautiful display of autumn flowering plants in which the *Bouvardias* were, perhaps, most interesting. These were arranged in blocks of each colour, the best being Mrs. R. Green (pink), President Cleveland (scarlet), President Garfield (double pink), Alfred Neuner (double white), Bridesmaid (double light pink), King of Scarlets (the best single scarlet), and Pride of Brooklyn (white). He had also good plants of *Begonias*—*Gloire de Lorraine* and Mrs. L. de Rothschild, while the shrubby *Veronicas* were excellent. The best forms were Diamant (red), Reine des Blanches (white).

#### Risks in Gathering Plants.

The white blossoms of the *Eidelweiss* frequently lure even experienced mountaineers to their doom, as it generally grows in most inaccessible places, with the result that an attempt to pluck it is often fraught with disaster. Only last summer a well-known German professor of the University of Leipsic lost his life on Mont Rosa while gathering this plant. The mountain *Saxifrage* has cost numerous lives, and the Alpine Pink is responsible for a heavy death toll. We need not, however, go outside our own island to find instances of human lives that have been sacrificed for flowers. In Ireland there is a little flower that blossoms in bogs, which is greatly prized by the peasantry to dye their homespun garments with. The neighbourhood of the Bog of Allen teems with stories of women and children who have been lost on the lonely bog while gathering this plant; and in the Highlands of Scotland the White Heather is frequently referred to by the Gaelic-speaking inhabitants as the "white flower of death," on account of the number of people who have lost their lives while gathering it in the mountains.

#### *Agathæa cœlestis*.

*Agathæa cœlestis* or, as it is generally called, the Blue Marguerite, is a small evergreen shrub, very useful for furnishing in the conservatory. Its silver-like leaves show to advantage when placed among other Ferns or other green-foliaged plants. The flower which it produces is of a very bright blue. Propagation is effected by means of cuttings. They can be raised from seed, but to obtain serviceable plants in the shortest time propagation by cuttings is advised. These should be taken in March and inserted round the sides of 3in pots filled with a sandy soil. When the cuttings are nicely rooted pot them off singly into small pots, using good sandy loam and a little peat. As the plants grow keep the shoots pinched in order to form bushy plants. Shift on into 54 and 48 size pots when they are well rooted; the latter size pot is quite large enough in which to grow this plant in. If required to bloom in the winter, the flower buds should be picked out as they appear, until the end of September, and then allow them to develop. As a bedding plant the *Agathæa* might be employed more extensively than it is at present. Given a somewhat dry and sunny aspect it does exceedingly well; it is especially serviceable used as a carpet to taller growing plants. For bedding purposes the cuttings should be put in some time in August.—G. R., Waddesden.

#### The Orchid League.

A West End florist was quick to turn to advantage the suggested Orchid League. He displayed a notice intimating that a sympathiser with the movement ought to wear an Orchid, indicative of his appreciation of Mr. Chamberlain. He "could supply the same in infinite variety fresh daily."

#### The Liverpool Botanic Garden.

Amongst the flowers showing strongly are *Salvia splendens*, *Begonias Gloire de Lorraine*, Mrs. Leopold de Rothschild, and Turnford Hall. They are arranged in groups of twenty plants each, interspersed with greenery. *Cattleya labiata autumnalis* is well represented, and several groups are arranged at intervals in the warm houses. The fine specimens of economic plants are gaining interest here. *Coffea arabica* (the coffee tree) is carrying large clusters of fruits, and so is the Cotton plant (*Gossypium*). A fine specimen of the Gamboge tree (*Xanthochymus pictorius*) is carrying over 100 green fruit. There is also a fine crop of those curious looking Cucurbitaceous fruits, the plants trained and suspended on the roofs in the intermediate house. The Bottle Gourd (*Lagenaria vulgaris*) and the Luffas attract a good deal of attention. The *Aristolochias* are flowering unusually free this season, especially *A. gigas*, the Pelican Flower. There are many other subjects which are equally interesting, and young gardeners in the neighbourhood who have not yet seen these gardens would spend a few hours there with profit and pleasure.—J. S.

#### *Mitraria coccinea*.

This beautiful plant is, like not a few of our old friends, nowadays little seen in the ordinary garden collections of plants. Like the Heath and the hardwooded race of greenhouse plants this one has been bundled "doon the burn" by an inexorable law of fashion. The scarlet, pendant flowers of the *Mitraria* give a characteristic effect to the plant, either when grown as a pot or climbing plant. Though properly speaking a climber, it can be equally grown as a low pot shrub. Perhaps the fact that it does not thrive well in an arid temperature has done much to oust it to obscurity. In such circumstances it is very liable to attacks of thrips, which cause the foliage to fall off at the expense of the beauty and health of the plant.

The small leaves are covered with minute hairs, and the colour is of a deep shining green, and the whole plant resembles, in a very marked degree, *Fuchsia microphylla*—itself an old-fashioned plant. Potted in fibrous peat and sandy loam, with good drainage, it ought to give a fair account of itself, and can either be propagated by cuttings or divisions. It is a native of Chiloe, and is sufficiently hardy to admit of cultivation out of doors in some parts of Britain. It belongs to the family of Gesnerworts, and is evergreen.—D. C.

#### *Calceolaria Burbidgei*.

For winter and spring blooming this shrubby species has a strong claim for notice from those who require decorative plants in the conservatory or the dwelling room, and particularly where yellow flowers are appreciated. It is best propagated by cuttings taken about April, employing a gentle bottom heat to assist an early root callus; and later they can be shifted, as they require more root-room, into pots of progressive sizes, until those of 8in are occupied. These pots give large, freely-flowered bushes that, when in the height of floral beauty, are striking objects; more so because of their out-of-season character, and the pleasing pale yellow colour of the flowers. Judging from the infrequency with which one meets with it in gardens, this species, unlike the ordinary bedding kinds, is not so well known or so familiar. That there are many species of plants cultivated in our greenhouses less deserving of space must be admitted by anyone privileged to see or grow *C. Burbidgei*. At Leighton, Westbury, Mr. Bound has for several years possessed a stock which in its season finds admirers among the many visitors to W. H. Laverton, Esq. In their season they have the useful trait of maintaining a succession of golden flower trusses, and are thus not so fleeting as many greenhouse plants commonly cultivated. Soft succulent shoots are the best for rooting; with any tendency towards woodiness they are stubborn of root, but with suitable frame accommodation and good cuttings this is not so marked.—W. S.

### A Notable Quartet.

So long as the snowy Madame Carnot and its primrose sport—Mrs. Mease—are staged in such magnificent form as they are at the exhibitions of this week, and most likely at those to follow, so long are they worthy of pictorial reproduction in our pages. Also, while the blooms that come from Mr. Norman Davis, of Framfield, Sussex, are unsurpassed, and generally quite unequalled, there is still something left for cultivators to master in their connection. And have we discarded *Australie* in favour of a (W.) Duckham or similarly coloured variety? Surely not; *Australie* will last yet awhile. Lastly, there is the early white exhibition Jap, Madame Gustave Henry, of sturdy habit; and each are amongst the most favoured of exhibition Chrysanthemums.

### Chrysanthemums at the Botanic Gardens, Liverpool.

The chief attraction here at this season is the magnificent array of Chrysanthemums. These attract crowds of the Liverpool public almost daily, and over 1,000 are arranged in the large span-roofed show house, 500 of these occupying the centre bed, and consisting of fine specimen flowers. We observed the following varieties, which are quite up to the exhibition standard, excellent in colour, substance, and form: Miss Elsie Fulton, Miss Mildred Ware, Mr. Bagnell Wilde, Miss Maynall, Miss Aliee Byron, Mrs. Greenfield, Rev. W. Wilks, Mrs. W. Popham, Mrs. J. Lewis, Mrs. Barkley, Rayonante, Sensation, W. R. Church, Chenon de Léché, and Le Grand Dragon. Many of these have large, massive blooms, and are arranged, not in the usual formal method, but with flowers projecting out here and there throughout the group. Smaller varieties occupy the side stages of this house, and also the greenhouse.—J. S.

### Chrysanthemums and Their Names.

Chrysanthemums are the speciality of this month. When groups of plants are arranged, it may be in the greenhouse, conservatory, or vinery, three or four pots deep, the names are often difficult to find when the wood tally that has done duty all the summer is sought for. To obviate this, a very simple means may be found in a card or paper label, with the name plainly written thereon, placed in such position that it is seen either above or immediately below the expanded flowers. Should the stakes be of a length allowing these cards being fixed in an incision at the top, the work of naming is simple in the extreme. If the stakes are of hazel, an incision could easily be made at any convenient height; but in these days bamboos are almost invariably employed, because of their greater durability and strength, and these are not so easily incised with an ordinary knife except at their upper extremity. To me there appears an opening for the inventor to provide either a metallic or white-faced card label that might be instantly adjusted by means of a clip. These might, in the case of standard sorts, be available for more than one year's use. A brass or steel wire holder similar to those employed on exhibition boxes and stands could easily be adapted to the purpose, when any kind of label that most conveniently comes within reach may be used.

Small luggage labels suggest themselves as being cheap, easily obtained, and most convenient for the purpose, the one all-important necessity being the adjustable holder that can be fixed to the stake at any given height. Without a name a Chrysanthemum loses in value and interest. After a summer's use of the ordinary deal label the name often becomes almost or entirely unintelligible to anyone save those in charge, who may have had daily opportunities to become familiar with names new or old.

The need is the more pressing when the collection of sorts is varied from year to year by the purchase and introduction of new ones raised and distributed by specialists. This necessity is so strongly felt that many gardeners, out of their own slender incomes and savings, invest in a few modern varieties where employers are so markedly indifferent to the demand of the times, and the need for even the smallest aspect of novelty, that they hold aloof from such desirable investment. There is probably no other plant of our greenhouses that creates so strong a desire for new kinds, and yet, how chary are some employers in supporting it!—W. S.

### Hints to Chrysanthemum Judges.

The remarks I purpose making on judging Chrysanthemums are intended for those who are commencing the arduous duties for the first time during the present season. It is right that new blood, as it were, should be imported into the ranks of Chrysanthemum judges. Persons who have not previously acted as judges must of necessity feel some trepidation when making their first award, especially if the class is well filled with exhibits close in point of merit. Exhibits in some classes judge themselves; but when the competition is keen it is then that a good method of adjudicating is beneficial. Much more difficulty is experienced in finding the third prize stand than there is in selecting the first. This class of prize deserves as much attention as does the first, and should receive its due proportion. The enormous increase of varieties in the Japanese section alone requires the adoption of a quick, and, at the same time, a sure method of dealing out justice to exhibitors.

Prizes are generally offered for a specified number of blooms, and not for a stand collectively, irrespective of its number. Every bloom should be judged upon its individual merits, or why specify a certain number, like "Twelve Japanese, distinct"?

There are various methods adopted of arriving at a definite issue as to the relative merits of exhibits, and I contend that all judges should be able and willing to give the reason why stand B is better than D. It may not always be policy to do this, but when an exhibitor approaches a judge in a proper manner for future educational reasons, then the adjudicator would do well to give the information required. If a judge is able to give a reason for all his awards, then there is little reason generally to think a mistake has been made in the awards.

No one will deny that adjudicating on the many blooms placed before the judges is very much a matter of individual taste. For instance, one judge may consider the broad florets of some variety peculiar to that, represent higher culture than his colleagues will admit; while the latter may have a leaning to forms of Japanese varieties, for instance, that represent the closely incurving types which his partner does not so much admire.

There are two methods of judging in vogue—pointing and comparison. Many judges still stick to the latter plan. This system was, perhaps, feasible many years ago, when varieties were less numerous; but now we have such an enormous number of sorts, the comparison method does not do justice to individual characteristics. If two stands are composed of identical varieties, then nothing would be fairer than to compare the blooms individually; but when does such an instance occur?

Apart from the justice of the case, the comparison method entails much unnecessary labour, as well as loss of time. How can any set of judges carry in their mind's eye, as it were, the merits of a stand of twenty-four blooms, much less forty-eight or sixty, which number is becoming common, especially when there are fifteen competitors, assuming, of course, that one stand does not stand out infinitely superior to all others in this particular class? To me it seems a waste of time to carry a stand of blooms about the show room for the purpose of comparison.

Judges may as well attempt to carry a collection of vegetables or fruit for the same purpose! Some experts of this order of opinion select what they think is the best stand of blooms in a certain class, and place it in front of all others in competition with this selected one. Very often a better is found; the first must then be replaced, and the one preferred for the time being carried round, perhaps to be displaced by another. Surely this cannot be the easiest, quickest, and most accurate method of dealing with competitive exhibits.

For the benefit of the beginner I will briefly explain the comparison method. For instance, twelve blooms of any section are being dealt with. One stand, which is apparently the best, is selected and placed in front of another by one of the judges. The second judge takes up a position on one side of the stand. They commence generally at the left hand corner of both stands. No bloom in the back row of stand A is compared with that in a similar position in stand B. Individually, A is considered to be superior to B. The former then scores a point or two, perhaps more, even if they are quite diverse in type. The leaning to this particular type may weigh more heavily with one judge than another. In the next instance, the balance may be in the opposite direction. This is mentally noted as one point off A stand, and so on is the whole stand compared, and very likely the judges forget which stand has the balance before they get through it, and have to start afresh, owing to having nothing tangible to refer to.

Some judges have a weakness for giving equal prizes to stands close in point of merit. This is a doctrine that I strongly condemn; it is an easy way out of a difficulty. There is a first, and it should be found.

### HOW TO JUDGE THE BLOOMS.

I ought now to give a few plain instructions how to proceed, as I have spoken so condemnably of the comparison method. In all well appointed shows the exhibits in one class are placed

together, or as near as possible, except under exceptional circumstances. The judges, having made themselves acquainted with the rules of the particular society they are acting for, for the time being, such as to the classification of certain varieties, or conditions which they have to carry out, remembering at all times they are not there to make laws, but to carry them out, even if they appear to be wrong, a walk round the room is then taken to obtain, as it were, the key bloom in each section. This cursory glance enables a judge to understand better the class of blooms he has to deal with at this particular exhibition. A mere glance at some of the competing stands is sufficient to know that they will not require closer scrutiny. Those that necessitate a further inspection are noted in some way peculiar to individual judges. If a second glance is not sufficient to settle the position of each, then the individual merit of each bloom is considered. The judges fix upon a maximum number of points, which is generally six, made

other point but this, it cannot then score a maximum number of points, owing to this deficiency. It seems superfluous to say that maximum means perfection, and that is indeed a rare occurrence to meet with. Instead of taking each bloom separately from left to right, beginning at the back row, I commence at the left hand end of the stand, taking the blooms in rows of three, upwards or downwards, it matters not, as long as the practice is the same throughout the whole show.

Some judges with a limited experience commence to point high; but as they proceed they so often find blooms of the same variety much superior to those to which they have given the maximum number of points to but a short time previously. Here, then, is an instance of the advantage of taking a quiet look round before commencing the awards to obtain the key bloom. The various points of excellence should be well studied, always bearing in mind that quality is of far more consequence than mere size.

MADAME G. HENRY.

AUSTRALIE.  
MRS. W. MEASE.  
**Chrysanthemums.**

MADAME CARNOT.

according to the key bloom noted previously. Now comes the question of allotting the points.

Of course, a beginner should have made himself acquainted with the properties contained in Chrysanthemum blooms of all sections, such as size, depth, solidity, breadth of petal, finish, freshness, form, and colour. Size is not determined by diameter alone; the depth should be taken into consideration. If a bloom has size, but lacks some other points, such as a want of freshness or density of colour, for its individuality, it cannot be called perfect, and cannot obtain the maximum number of points. Five does not perhaps do it justice; then five and a half should be given, and so on throughout the stand. Seldom, indeed, do we find maximum blooms. Some persons may think half points are ridiculous, much less quarter points. In my opinion, though, it is the only way of dealing justice accurately.

There is a strong tendency amongst exhibitors to stage blooms not fully expanded. If a bloom be perfect in every

Just one example of pointing, then I must conclude, as I have already occupied much space. The front row bloom is a full sized one of Mrs. T. W. Pockett, but is a trifle pale in colour; to this is given four points. The middle bloom is a perfect example in every way but size of Mrs. Barkley; to this is given five and a half points. The back row bloom is a full sized one of Mrs. J. Lewis, perfect in petal and "build," but showing a faint tinge of age on the lower florets. To this is also given five and a half points, making a total of fifteen points, and so on until all the rows are done. The points are then added up, and that having the highest number wins. Suppose two stands are equal in number of points—not a unique experience, certainly—the two stands then must be gone over again, this time starting from the opposite end; and if they total an equal number again, the arrangement of colour and staging of the blooms will decide the difference.—E. MOLYNEUX.

[This letter, and the one from Mr. Brotherston, should be compared.—Ed.]

### Pear, Passe Colmar.

This is a Pear of medium size, with fine melting fruits, though their appearance is not very attractive. The tree forms either a good pyramid or bush, being particularly prolific on the latter, in warm sheltered gardens; but wherever the aspect of the garden is exposed, a wall should be given. The true season, when the fruits are at their best, is December, though they are also used in dessert a month earlier. The "Fruit Manual" says of it: "This is of Belgian origin, and is supposed to have been raised by M. Hardenpont, of Mons, in Hainault, in 1758, and has for many years been cultivated in Belgium under different names. It was first received in this country by R. Wilbraham, Esq., of Twickenham, and by him given to a person named Chapman, a market gardener at Brentford End, Isleworth, who cultivated it extensively, and attached his own name to it. The fruit was sold for 25s., and the trees for 21s. each."

### Autumnal Strawberries in Cornwall.

It occurs to me that as I live on the north coast of Cornwall, on a heavy, though sandy, clay, and therefore under very different conditions with regard to climate, soil, and situation to those obtaining at Sproughton, Suffolk, my experience with the Perpetual Strawberries may be of some interest. I have had ample opportunities of comparing my Strawberries with my father's, and though my method of cultivation differs slightly, I think my results are equally satisfactory. I don't get quite such an abundant display of fruit as I saw at Sproughton in September last, but I get an astonishing quantity. On the whole they are of larger size, and, I should like to say, of better flavour; but on that point I am hardly an impartial judge; all the things in my garden taste better than other people's—to me. I grow my plants in rows (St. Joseph 1ft apart, St. Antoine 2ft apart), and I don't allow any runners at all. At Sproughton I think I am right in saying that runners are allowed the first year—to make the magic circles of your illustration—and not afterwards. I consider that by my method I arrive in the first year at the same position as Sproughton is in the second year, with the additional advantage of having my plants in orderly rows. This makes, it seems to me, the keeping down of runners and picking of fruit an easier matter, though, of course, it necessitates a larger original stock of plants.

I do not support the fruit above the leaves; they do better, in this climate, under their shelter. Slugs were a terrible nuisance, but a brood of very young ducks, turned out for a fortnight in spring, when the blossoms are just starting, will effect a complete cure, especially if the ground is gently Dutch-hoed once or twice in their presence; they do no harm to the Strawberries. My bed has lasted three years, and shows no sign of deterioration, but I am turning the cage into a hen run this year, which I consider should make a good "alternate crop." I grow St. Joseph and St. Antoine only, and I have grown the latter since it first came out. I bought originally six plants, one of which was an ordinary Royal Sovereign, and confined their attention at first to making runners. They did that well, and their numerous progeny have all been Perpetual. They are *more* Perpetual, with me, the older they get, but are very leafy, and the fruit is not much larger than a St. Joseph when it really gets under way. I had an accidental seedling, clearly crossed with Latest of All, a bed of which was next door, and this was quite Perpetual, large, and of excellent flavour; but it took such an extraordinary time ripening that I have not encouraged it. —P. H. FOSTER-MELLIAR.

### Farmyard Manure.

The substance that goes by the name of farmyard manure, fold manure, dung, or muck, chiefly consists of (a) the material that was used as litter, usually straw, sometimes peat, fern, sawdust, &c.; (b) the food that passed through the animals in an undigested condition and has been voided in the solid form; and (c) the urine, which contains that part of the food which the animals digested but did not retain in their system. The urine also contains the waste of the tissues of the animal's body. The proportions of these parts will vary with circumstances. For instance, when it is the object of the farmer to break down as much straw as possible, a relatively large amount

of the farmyard manure will consist of litter, but where litter is used very sparingly—as in upland dairies—the manure will consist very largely of the solid and liquid excreta.

All food contains more or less water; even in such substances as grain or cake one-seventh or one-eighth, while in others, like turnips, nine-tenths is pure water. Neglecting this water, it may be said that for every 100lbs of food that an animal consumes, about 50lbs reappear in the dung or urine; the other 50lbs being burned up in its system, becoming gas or water, or being stored up in its body as bone, flesh, fat, hair, &c. A well-grown bullock or cow—weighing, say, 9cwt—will consume daily, if on full ration, about 24lb of absolutely dry food, as for example:—

56 lb. Roots (90 per cent. water) .. ..	=	5.6 lb. dry.
6 lb. Cake or Meal (12 per cent. water) ..	=	5.3 ..
16 lb. Hay or Straw (16 per cent. water) ..	=	13.4 ..

Total .. 24.3 lb. of dry matter

One half of this, say, 12lbs, will reappear as manure, and to this has to be added the whole of the dry matter in the litter, say, 10lbs, making the daily output of dry matter in farmyard manure 22lbs. Needless to say, it may be much more or much less, depending on the age and size of the animals, and on the way in which they are fed and littered. Ordinary farmyard manure is, of course, not dry; on the contrary, it contains about 75 per cent. of water. The daily output will therefore weigh not 22lbs but 88lbs, say 3cwt. Thus on a six months' keep the amount of farmyard manure yielded will be about 7 tons. This calculation applies to full-grown cattle; if the stock consists, as it generally does, of a fair proportion of younger animals, the output per head may be only 3 or 4 tons. It follows that on a farm with a mixed stock of 50 head, comprising 3 or 4 horses, enough dung should be produced during winter to give a dressing of 10 or 12 tons per acre to about 15–20 acres of land, or 3–4 acres less when allowance is made for loss during storage.

From the manurial point of view the three substances that are of most importance in the food are nitrogen, phosphoric acid, and potash. Although only one-half of the solid matter in the food reappears in the manure, at least three-quarters of the nitrogen, and nine-tenths of the phosphoric acid and potash, are voided. These proportions will be considerably reduced in the case of very young animals, and increased in the case of fattening cattle. Of the nitrogen that passes through an animal a large proportion finds its way out in the urine than in the solid excreta. The same is true of the potash, whereas the phosphoric acid—i.e., the phosphates—are chiefly voided in the dung. It will thus be seen that two of the three valuable elements of plant-food are more abundant in the liquids than in the solids of animal excreta, and, not only so, but pound for pound, the substances in the liquids are much more valuable for crops because they are much more readily available. The Rothamsted experiments have shown that much of the nitrogen in the solid part of dung can hardly be said to be of any use to plants, whereas the nitrogen of the liquid portion is almost as active and therefore as valuable as nitrate of soda or sulphate of ammonia.

In a ton of ordinary farmyard manure there is as much nitrogen, phosphate, and potash as in twelve or fifteen shillings' worth of artificial manure, and if a ton of dung is not usually valued at even half these figures this is chiefly because a large part of the three substances mentioned never becomes available, or is lost before crops can make use of it. True, a ton of farmyard manure is more expensive to handle than 2cwt or 3cwt of artificials, and this, of course, reduces its relative value; but, on the other hand, farmyard manure has a beneficial influence on crops just because it is a heavy bulky substance, so that these two considerations may be held roughly to balance or cancel each other.

### Variation in the Quality and Character of Dung.

This is affected by the kind of food. Food rich in fertilising materials, especially nitrogen, produces rich dung. The kind of animal—horses produce dry, hot dung that ferments and acts quickly, but does not last long, whereas the dung of cattle and pigs is cold, slow-acting, and more durable. The dung of young stores and dairy cows is rather poor in all the important elements of plant-food, because, in the former case, these elements have, to a relatively large extent, gone to form bone and muscle, while in the latter case they have found their way into the milk. For instance, to quote the Rothamsted figures, while the excreta of a fattening bullock getting decorticated cotton cake will contain about 97 per cent. of the nitrogen, 96 per cent. of the phosphoric acid, and 99 per cent. of the potash present in the cake, the corresponding figures for a milk cow are only 87 per cent. for the nitrogen, 89 per cent. for the phosphoric acid, and 86 per cent. for the potash. This means that for every 3lbs of nitrogen, 4lbs of phosphoric acid, and 1lb of potash that the fattening bullock abstracts, the milk cow appropriates 13lbs, 11lbs, and 14lbs respectively. The age of the dung.—Rotten dung is richer and more active, provided it has been properly "made," than comparatively fresh

undecomposed material. The manner of storage.—Properly-managed dung is more valuable than that which has been mis-managed.

(To be continued.)

## Book Notices.

### An Introduction to Nature Study.<sup>1</sup>

We cannot describe this as a very interesting book, or one likely to tempt beginners into the study of natural objects. The author has confined himself simply to the discussion of groups, and types from the groups, using simple language, it is true; but his style of writing, after all, is short and precise. It could have been freer, in more of the literary form, and still have been precise. One-half is devoted to plant life, the other half to animals. The author deals in separate chapters with Grasses, Ferns, Moulds and other Fungi, Algæ, and the high types of vegetation as well. The opening chapters deal with and explain elementary botany. In the animal section the rabbit is detailed as representing a typical mammal, and then follow birds, frogs and tadpoles, crustaceans, molluscs, and worms. As elementary treatises on biology are not very numerous, this one should be considerably used.

### Culture of Hardy Tree and Bush Fruits.<sup>2</sup>

A simple little treatise on the various methods of propagating fruits, and how to cultivate them. Insect pests and fungoid diseases are briefly noticed, and chapters are devoted to fungicides and insecticides, discussing their properties, and how they ought to be used. We observe some hints on page 46 on how to save trees that have been barked all round. What is done is the insertion of connecting strands (shoots) between the two gnawed surfaces, which become joined once a callus forms, and so the sap can travel up. The booklet is illustrated, and is published at actual cost price.

### Beautiful Flowering Trees and Shrubs.<sup>3</sup>

Now that gardeners in general are devoting greater attention to the consideration of ornamental trees and shrubs, and to the proper culture, grouping, and effective joint arrangement of the same, this little book will naturally find a place. The means of propagating trees and shrubs are discussed, but we think it would have been very much more to the interests both of publishers and readers to have omitted the hideous coloured plates, thirty-three of which are furnished, and to have devoted the space to greater amplification of some of the chapters, and this one on propagation especially. The author provides chapters on trees for towns, for street planting, trees with coloured foliage, trees for winter effects, how to group trees and shrubs, &c.; and the second half of the book is given over to a survey of trees and shrubs alphabetically arranged. This, from a cursory glance through, appears to be as complete as the generality of planters may require. Coniferæ are summarily included, and a chapter at the end is entitled "The Relationship of Trees and Shrubs," in which each is grouped with its allies in Natural Orders. The book extends to 152 pp., 8ins by 5ins, with crimson binding. Had the coloured plates been left out, the price could have been reduced; but they may attract the inexperienced amateur.

### Economic Zoology.<sup>4</sup>

The present volume consists primarily of a series of Reports to the Board of Agriculture, of Reports and letters to a variety of unofficial correspondents, and of Reports to the Foreign Office and to the Colonial Office, drawn up by Mr. F. V. Theobald during the years 1901-1902. These are the opening lines of the preface, which is written by the Director of the Natural History Museum, Prof. E. Ray Lankester. The introduction explains the classification of animals from the point of view of economic zoology, and we observe sections devoted to Animals Injurious to Horticulture, to Forestry, and to Agriculture. By "animals" it should be understood that the word is used in reference to what are usually called "insects" by the non-scientific people. To show the valuable character of this Report to gardeners, it will only be necessary to name a few of the subjects that are dealt with, as the injurious Tipulidæ, the Pigmy Potato Beetle, Potato Stem-borer, the Bud Moth, Ants (their destruction), Scale Insects, various Aphides, Beetles,

Wireworms, and Flies. The publication has an index, and extends to 192 pp., each nearly 10ins by 6ins, with some illustrations.

### Gardening for All.<sup>5</sup>

The title of this book is ambiguous. It is a primer for cottagers, allotment holders, and amateur gardeners. The writer, however, is not in the least obscure, but makes his statements very plain, and assists them with numerous drawings. Vegetables, fruits, and flowers that are most generally cultivated are here considered, and, having had a long experience in drawing up careful reports in connection with the Experimental Garden at Droitwich, Mr. Udale knows how to summarise conclusions in the most condensed form for reference. The tables on artificial manures for the different crops, and how much of each is required, will therefore be of considerable service. The plans for cropping allotment and cottage gardens are another feature to which we draw attention, and there are others showing rotation cropping, and also the utilisation of ground for both fruit trees and vegetable crops. Pp. 177, 7ins by 4ins.

## Winter Flowering Stocks.

An effort made to sing the praises of the summer Ten Week Stock, because of its delightful fragrance, would be regarded as superfluous. Commonly cultivated as the Ten Week and other Stocks are in summer, they are hardly known in winter; yet there is the same fragrance, and the same flowers, though not, perhaps, so many colours obtainable. There are strains specially selected for winter purposes which anyone with a frame and greenhouse can cultivate, and certainly there ought to be as great a value in a well grown Stock as in that of a Primula or Cineraria, plants which so many, even with scant accommodation, strive to grow. I am not disposed to decry the Primula or the Cineraria, but I hold that the winter Stock should have as much favour, because, in addition to the charm of the Stock as a plant, there is the delightful fragrance which pervades the greenhouse or the dwelling room, unconsciously bringing reminders of the summer evenings spent among the flowers in the open garden. The greater charm of the Stock is embodied in the scent which it emits at eventide, a time when most scented flowers give of their best.

The varieties that have given us so much satisfaction are Sutton's Perfection, white and red: Princess Alice, and Winter White but to name these few necessarily leaves unmentioned a good many others probably of equal value. It suffices, however, for me to name those of which I have experience, leaving other readers to supplement them with those kinds that will surpass, or even equal them in all round merit. The last-named is an Intermediate Stock, dwarf of growth, and bearing short spikes of extra fine blooms; the others are of the Ten Week class, giving taller plants and greater freedom of spike, which are so convenient and useful for cutting.

Sown in June and July, and dealt with as one would do Cinerarias, they make good flowering plants from October onwards through the winter. They do not, fortunately, expend themselves in one display, but when cut other successive shoots and flowers appear, a trait which is of so much value in winter time. The earlier sown batch are stood in the open when they have advanced to a size justifying such a course. This sets up a sturdy and more consolidated growth than would obtain confined to the pit or frame; but in this, as in every other gardening matter, the ultimate purpose is that which should direct procedure from first to last.—W. S.

### Aster puniceus pulcherrimus.

There is in cultivation a very fine garden Starwort called Aster puniceus pulcherrimus, which I have grown in my garden for a good many years, and which one finds is much admired, although I do not find it so useful for cutting as some others. The flowers are crowded together, so to speak, at the top of the stems, and when cut are not so conveniently arranged with others as one would like, especially if one desires to show the character of the flower—a desirable point with some of us in arranging these blooms. The arrangement of the flowers on the plants is almost pyramidal, while their colour is fairly well described as blush white, the petals being partially incurved. The stems of the plant are reddish, and it grows about 5ft high. It flowered this year early in October, but it generally comes into bloom in September. It seems to differ much from the typical Aster puniceus as figured, and to be greatly the superior of that plant. Of its origin I have no record.—S. A.

## Notes on Some of the Newer Exhibition Roses.

(The Rose Analysis.)

Mr. Mawley's Analyses of Roses, on which he spends so much ingenious labour, is always necessarily of great interest to rosarians and exhibitors, who are deeply indebted to him for the results of his task. Both matter and manner have nevertheless been subjected to criticism in past years, especially, perhaps, by my friend, the late C. J. Grahame. Personally I think the analysis is sound, as well as ingenious, and ought by this time to be pretty well understood, but has little value except for the National Metropolitan Show, owing to the early date at which that exhibition is generally held. I am surprised that Mr. Mawley states that early and late seasons were almost equally divided in the last eight years. He is a much better authority on that subject than I, but I should have said we had had no really early season since 1893.

Though, in common probably with most interested in the matter, I am surprised at the position occupied by some varieties in each of the tables. I will confine myself to some remarks upon such of the manners and customs of the newer varieties as I am able to speak of from personal observation.

Mr. Mawley includes under this head the Roses sent out in the four years, 1899-1902 inclusive. He seems to me to have here made an error by including Florence Pemberton H.T., which was only sent out this (1903) summer. A. Dickson and Sons themselves, as well as other trade growers, give its date as 1903. The Rose is given a very high position in the list as No. 4; but, I take it, no one can have seen a bloom of it except in Messrs. Dicksons' own stands, or growing anywhere but in their grounds, except as pot plants or "run out" buds.

It hardly seems necessary to comment upon the 1899 varieties, which ought to be fairly known by this time; so, beginning with H.P.'s, I will leave out of Mr. Mawley's list Bessie Brown, Mrs. Cocker, and Ulster, merely remarking that I have found the latter (Ulster), as is so often the case with weak and dwarf growers, do well and make a nice plant on a short standard of about eighteen inches high.

We come, then, to the first H.P. on Mr. Mawley's list, and third in order of merit after Mildred Grant and Bessie Brown (which was my own order), to Frau Karl Druschki; and those who have grown this Rose must cordially agree with the estimate of its merits which Mr. Mawley lays before us. I well remember the procession of white H.P.'s which he recounts, but I can recall Madame Noman before Madame Lacharme, and cannot say I "welcomed" either Mabel Morrison or White Baroness. There is no doubt we have now a far better white H.P. in Frau Karl Druschki than any we have had before; in growth it surpasses all the others except Margaret Dickson; in shape it especially and particularly excels, and in purity of colour it is at least equal, if not superior, to the best. Considering how purely white the perfect bloom is, it seems odd to notice that the bud, when it first "shows colour" (when the calyx turns back, exposing the cone of young petals before the first unfolds), is purely pink, thus testifying, as an embryologist would probably say, to a pink parent.

The next H.P. on the list, omitting Ulster, is Ben Cant, and one cannot help thinking how pleased the dear old man would have been with it, not only as a splendid Rose, but as one of several which have so soon testified to the skill of his sons in the difficult art of hybridisation. It is, I believe, a cross between Horace Vernet and Victor Hugo; and it is, as a cross, one of the most perfect yet sent out, for it seems to partake, almost equally, of the characteristics and general appearance of both parents, without "throwing back" or showing any trace of any other Rose. The season with me was against it, for though it has been almost washed out of our recollection since the "season"—i.e., the last week in June and first fortnight in July—that period was here absolutely rainless (a rare occurrence) and very hot, so that the crimson H.P.'s never got a chance to appear at their best. It appeared to me to be rather more like Victor Hugo than Horace Vernet, in opening too quickly under strong sunshine; but, on the other hand, to be stronger in growth and habit than either of them.

Coming next to the Hybrid Teas, we must all regret with Mr. Mawley the very general tendency to white among the new varieties. Alice Grahame, Alice Lindsell, Duchess of Portland, Edith Dombain, Florence Pemberton, Hélène Guillot, Mildred Grant, Perle von Godesberg, and Robert Scott, with, no doubt, some others, may be described as "whitish"—that is, practically white, to the ordinary cultivator, who is not likely to have many flowers at their strongest and best. However, this defect is certain to be familiar to the raisers, and I have no doubt they will

do their best to meet the demand for brighter colours. At the same time they should not forget that we are abundantly satisfied with the general great improvement in form which these magnificent new Hybrid Teas have given us; and we by no means desire that this should be lost, or even depreciated, for the sake of colour.

First, of undoubted right, on Mr. Mawley's list of H.T.'s comes Mildred Grant. If anyone wishes to know what this magnificent Rose is like, let him get a copy of A. Dickson and Sons' current Rose catalogue. On the cover is a print of Mildred Grant, which I have no hesitation in saying is the best coloured likeness of a Rose I have ever seen—a splendid work of art of a splendid Rose, though one would fancy it would have looked better still with a darker background. I have seen some pretty pictures of Roses, and a good many very bad ones; but this is not only beautiful; it is a likeness, so that one could name it with as much confidence as if it was the actual flower. Mildred Grant is the largest of Show Roses—that is, of those of good shape. The plant is more "robust" than "vigorous" in growth, the shoots not making much long growth without forming buds, which take some time to mature and grow and lengthen into the great flowers. The young bloom must be protected from rain, for—as is the case with some, if not all, other white Roses—a drop of water, if allowed to dry on the petals, will leave a red spot, and if allowed to become thoroughly wet, the unopened flower is apt to rot and gum, like all other Roses of pointed shape, but I have not found it a serious offender in this respect. The bloom should not be tied up too soon; and, indeed, the tying up of Roses for exhibition is an evil, hindering the perfect placing of the middle petals, but a necessary one very often owing to the baking the blooms have to withstand from an early hour in oven-like tents. The plant is a good autumnal bloomer, and from my limited experience I should say it does equally well as a dwarf or a standard; the leafstalks are very long and spreading, and my plants have not been attacked by mildew. It is certainly a characteristic and unique Rose, which is likely to rise a good many places in next year's general analysis. But, though in favourable circumstances it will undoubtedly come of the colour figured on Messrs. Dicksons' catalogue, as a general rule it must be looked on, for the ordinary cultivator, as practically white.—W. R. RAILLEM.

(To be continued.)

## Millipedes and Centipedes.

Millipedes (Figs. 1 and 2) and centipedes (Fig. 3) belong to a group of the animal kingdom known as the Myriapoda. These animals are recognised by having legs on every ring or segment of the body. In the case of the millipedes there are two pairs of legs to each segment; in the centipedes, one pair only. It

FIG. 1.

FIG. 2.

FIG. 3.

Figs. 1 and 2, Millipedes (1, *Julus pulchellus*; 2, *Polydesmus complanatus*);  
Fig. 3, Centipede (*Geophilus subterraneus*).

is important to notice these differences, as the millipedes are injurious and the centipedes are beneficial.

They are found in all manner of places, both in the field and in the garden, and are especially attracted by decaying vegetation, such as heaps of leaf mould, rotting stalks, &c. They are also found crawling about under the bark of trees and in the soil. The difference in structure is also accompanied by a difference in habits; centipedes are very active and are carnivorous, whereas millipedes are mostly herbivorous, and live upon sound and decaying vegetable matter. The millipedes have the mouth formed for chewing, there being powerful biting mandibles with which to devour the roots of plants. Centipedes are provided with poison claws. The bite of some centipedes in the tropics is very poisonous to man, but none are so in this country. Milli-

pedes are often known as "false wireworms," but they can easily be told from the true wireworm (Leaflet 10) by the great number of legs.

#### Description and Life History.

The female millipede (*Julus terrestris*) deposits her eggs from May to July in a nest made of pieces of earth fastened together with saliva; this nest is round in form, and has a small hole at the top through which the eggs are dropped. The eggs vary in number from sixty to 100. The hole is then stopped up, and the eggs mature in from ten to fourteen days. The young millipedes have only three pairs of legs, the others appear in groups by degrees. Growth in a millipede takes place by lengthening at the posterior end, the growth evidently taking place between the penultimate and last segments. Miss Ormerod states that millipedes lay their eggs from December to May, but as this does not agree with Sinclair's statements, the observations were probably made on different species.

The most injurious millipedes belong to the families Julidae and Polydesmidae. The latter (Fig. 2) are the flattened snake millipedes, the injurious species being shown in figure 2. The most troublesome millipede is *Julus pulchellus* (Fig. 1). This is nearly half an inch long, slender, about the thickness of a fair-sized pin, pale yellowish-pink in colour, with a double row of purple spots on it. *Julus terrestris*, another common species, is black and has a pointed tail. These Julidae feed upon all manner of roots. The smaller *Julus pulchellus* also eats into Potatoes and Lilies, often hollowing them out completely; the larger species, according to some observers, also feed upon snails, slugs, and some insects. The common species of flattened millipedes, *Polydesmus complanatus* (Fig. 2), is of a pale purplish-white to dull rosy tint, and is nearly an inch long, with the sides notched.

Centipedes, or Chilopoda, are beneficial, the food being composed of snails, slugs, and ground insects. Three of the commonest genera are *Lithobius*, *Geophilus* (Fig. 3) and *Scolopendra*. The eggs of *Lithobius* are laid from June to August; they are about the size of a number five shot, spherical in form, and covered with a sticky slime. The female, after laying an egg, rolls it about in the earth until it is all covered with soil and resembles a grain of earth. A small number only are laid by each female; and the males frequently devour the eggs before the female coats them with earth. In the other genera the number probably varies to some extent. *Geophilus* is said to lay its eggs in an earthen cell; *Scolopendra* to bring forth living young.

#### Methods of Prevention and Remedies against Millipedes.

These pests are frequently distributed with leaf mould, which should, therefore, be examined before being used, and if found to contain them should be mixed with lime. Their numbers in the field may also be lessened by broad-casting lime over the surface and working it into the soil. Soot and water, in the proportion of a handful of soot to half a gallon of water, is found to drive them away from the roots of garden plants for a time. They may also be trapped in numbers by placing pieces of Mangolds scooped out just under the ground near the plants they are attacking; they swarm over the baits and may then be collected and destroyed.

Another certain way of killing them on small areas is by injecting bisulphide of carbon into the soil. They may also be trapped by soaking decaying Cabbage leaves or decaying roots in Paris green and placing them about in gardens; the millipedes feed upon them and thus get poisoned.

The Board of Agriculture and Fisheries would be glad if recipients of this leaflet would make it known to others interested in the subject. Copies may be obtained free of charge and post free on application to the Secretary, Board of Agriculture and Fisheries, 4, Whitehall Place, London, S.W. Letters of application so addressed need not be stamped.

## Societies.

### R.H.S. Scientific Committee, Oct. 27th.

Present: Dr. M. T. Masters, F.R.S. (in the chair); Messrs. Odell, Saunders, Massee, Baker, and Worsdell; Drs. Rendle and Cooke; Revs. W. Wilks and G. Henslow, Hon. Sec.

*Crassula Aitonii*.—Mr. Odell showed specimens of this Karroo plant of S. Africa remarkable for bearing leaf buds in lieu of flowers, each consisting of two pairs of minute leaves.

*Begonia bi-sexual*.—Mr. Worsdell showed malformed flowers with abortive ovaries, bearing a tuft of stamens issuing from the base of the style.

*Spinach failing*.—Mrs. Killick sent plants which were sown in August, and for three years consecutively at first came up well, but subsequently turned yellow. Spring sown Spinach never failed. It was suggested that if any grubs were present lime and soot should be used before sowing. Other growers had experienced the same thing. A deficiency of midday sunlight appeared to affect Spinach, as a

whole bed was a total failure in an enclosed place where the sun only shone upon it late in the day. Such causes did not apply.

*Jasmine root hypertrophied*.—Dr. Masters showed a specimen of root forming a large fungoid mass, but no trace of insect or fungus was present. Mr. Massee observed that ants will produce a very similar result on various plants.

*Parsley leaf miner*.—Mr. Wilks showed leaves infested by some grub, upon which Mr. Saunders reports as follows: "The Parsley leaves are attacked by the grubs of a fly, probably by those of the 'Celery fly' (*Tephritis onopordinis*), which they very much resemble; but the grubs of flies belonging to the same genus are often so much alike that it is impossible to distinguish between them. I have not heard of these grubs attacking Parsley before, but as both Celery and Parsnips are injured by them it is quite likely that Parsley may also be attacked, all these being umbellifers. The chrysalides are no doubt formed in the soil. If a crop has been badly injured by these grubs it should be pulled up and the ground well dressed with gas lime."

*Injurious insects*.—Miss Cope, F.R.H.S., inquired for information how to destroy certain insects. Mr. Saunders' report is adjoined: "The so-called insect sent by Miss Cope is one of the 'Centipedes' (*Geophilus longicornis*). I cannot say positively whether it is injurious to plants or not, my own views being that it is not, as it belongs to a carnivorous family, and is provided with a large pair of poison fangs, which would not be of any use to a creature fed on vegetable substances. When found at the roots of plants, as they often are, I believe, they have gone there to feed on insects which have been attacking the roots; but they have been so often accused of injuring plants, and have been found under very suspicious circumstances, that I do not feel justified in giving a definite verdict. It is possible that when their ordinary food becomes scarce, they may take to a vegetarian diet. The ordinary quick running centipede is undoubtedly of much service in gardens in killing small insects, slugs, &c. The green insect spoken of is probably one of the *Cercopidae*, the family to which the common froghopper belongs; but without seeing a specimen it is impossible to say positively. The best means of destroying this pest, if I am right, is to shake the plants over a sheet of pasteboard or tin which has been newly painted or tarred, so as to catch the insects when they jump off the plants."

### Croydon Chrysanthemum, November 3rd and 4th.

The show held in the Public Hall, Croydon, on Tuesday and Wednesday of this week, though small, was of high merit. Though Chrysanthemums were the chief subjects, they were not the only products on view, for excellent Grapes and Apples, together with culinary vegetables, were represented.

At the time of our visit on Tuesday, the Mayor-elect opened the exhibition in the presence of the Society's officials and some of its patrons. He thought it was a mistake to hold Chrysanthemum shows earlier—that seemed to be a tendency; but he would prefer to hold them back till as late as possible, seeing we had Dahlias and Michaelmas Daisies to feast the eyes with, till the present time. The judges had given a very favourable report of the present exhibition, and of the management of it. The chief part of the work falls upon Mr. W. B. Beckett, who for fifteen years has been honorary secretary. This is a long and notable record, but Mr. Beckett never complains of overwork—rather is he proud of it, and keen for the progress of the Society.

We do not profess to have noticed every class, but the leading classes are suitably reported. To write of everything at an exhibition without discrimination is not in the interests of either exhibitors, societies, or floriculture.

Class 1 was for eighteen Japanese blooms and eighteen incurved, and here Mr. G. J. Hunt, gardener to Pantia Ralli, Esq., Ashted Park, Epsom, was first for the third time, thus winning the Challenge Cup outright. His blooms were wonderfully fine, and the set included both the premier Jap and incurved, viz., Miss Stopford (8ins or more in depth, and very handsome) and C. H. Curtis, at its best. Of the Japs we would also specially name F. S. Vallis (an enormous flower), Godfrey's Pride, Edith Smith, Madame P. Radaelli, George Lawrence, Miss Olive Miller, and Bessie Godfrey. The best finished incurveds were Globe d'Or, Duchess of Fife, Mrs. C. Crooks, Lady Isobel, and Hanwell Glory. Mr. C. J. Salter, from Reigate, was a good second, but his flowers appeared to be not so heavy or so strong. Nevertheless, he staged splendid samples of Bessie Godfrey (a gem), General Hutton, W. R. Church, W. A. Etherington, and F. S. Vallis. His incurveds were very pure in colour and fairly even and smooth, C. H. Curtis, Annie Hills, Hanwell Glory, and Empress being very pleasing. Third of three competitors came Mr. F. Bible, gardener to H.R.H. Prince Hatzfeldt, Draycot Park, Chippenham, who was very strong, and the class must have demanded keen scrutiny. His Bessie Godfrey was charming, and so were Mrs. Vallis, Madame P. Radaelli, Sensation, and Captain Percy Scott. The incurveds were clear and of good size. The names might have been written on stouter cards and been brought forward a little.

Mr. W. Collins, of Engadine, had the only exhibit in class 2, for a group of Chrysanthemums. For a semi-circular group of foliage and flowering plants (class 19), Mr. C. Perrett was first, and Mr. H. Dyer second. For six plants of Gloire de Lorraine,

Mr. G. Lewry, from Duppas Hill, was an easy first, and Mr. J. King second.

**OPEN CLASSES.**—For a group of Chrysanthemums in pots (class 4), arranged in the orthodox circular fashion, Mr. W. Hollins, Engadine, Park Hill Road, led; Mr. E. Puxted was second; and Mr. W. A. Cook, from Shirley Park, was third. For eighteen Japs in twelve varieties, Mr. G. Halsey, from Riddings Court, Caterham Valley, stood first with a fine set, his best being Exmouth Crimson, Mrs. R. Cadbury, Madame Chenon de Léché, J. R. Upton, and Mrs. Mease. Mr. C. Lane, of Caterham Valley, came second with very fair flowers; and Mr. J. King, The Red House, Bickley, was third, out of four.

For the dozen incurved blooms in nine kinds, Mr. C. Lane led with neat flowers; Mr. J. King was second, and Mr. G. Halsey third.

Mr. C. Lane was leader in class 7, for ten blooms shown in two vases. He staged Mrs. Mease and W. R. Church. The second place fell to Mr. G. Halsey, with Mrs. Mease and Mrs. G. Mileham. Mr. F. Bible was here again third, with Mrs. Vallis and Australia.

For nine foliage plants (class 5), Mr. C. Lane was first, and Mr. J. King second.

In Division 2, class 29, Mr. Norman Wrightson, Elgin Road, Croydon, was premier for the ten blooms in vases, having quite a number of varieties. Mr. G. Mills, Hazel Dell, Croydon, was second; Mr. F. Wells, Albert Road, and R. E. Mason, Vincent Road, equal third, out of seven entries.

For three vases of pompons (class 32) the lead was with Mr. W. Philpot, of Church Street, and J. Pittman was second, the blooms being very good. For the two vases, the only entry was from J. R. Filce. For six Japs (class 30) Mr. F. Wells led, and had in his set a splendid bloom of W. Duckham. Mrs. Green, Lynton, Temple Road, was winner for the decorated centre-piece.

The special prize of half a guinea, given by N. Waterall, Esq., for a bloom of King Edward Chrysanthemum, was won by Mr. A. Shipway, gardener to R. C. Forster, Esq., The Grange, Sutton.

**FRUITS AND VEGETABLES** made a bright and creditable display. The chief exhibitors of fruits were Messrs. W. Lintott, W. Jones, W. A. Cook, G. Lewry, G. Johnson, O. Jeal, C. Perrett, and Ernest Phillips. For vegetables the chief winners were G. Snellins, F. J. Davis, C. Perrett, and J. Friend, each with collections. Messrs. Lintott, G. Prebble, Snelling and Edwards had the best dishes of round and kidney Potatoes, and J. R. Filce won for Coleworts. Celery and Onions were only fair; Parsnips were scarred; but Turnips were generally good.

For two bunches of white Grapes Mr. W. Taylor beat Mr. W. Lintott; and for two blacks Mr. Lintott led against Mr. J. Friend, of Godstone; and Mr. W. Taylor third.

**NON-COMPETITIVE.**—An exhibit of two dozen Japs and incurved, from Mr. W. E. Mills, gardener to Frank Lloyd, Esq., Coombe House, Croydon, was highly commended. His Lord Ludlow was very fine, and also the Bessie Godfrey.

Messrs. John Peed and Son, West Norwood, staged both flowers and Apples, the latter being good fruits of the leading sorts.

Mr. Thos. Butcher showed floral decorations, and T. Pascall and Sons, S. Norwood Pottery, staged their wares.

Mr. Norman Davis was forward with exceedingly handsome blooms, including Madame Paolo Radaelli, Mrs. F. W. Vallis, Mrs. K. R. Knight, H. Perkins, Miss M. Ware, F. W. Vallis, Gen. Hutton, Mrs. Mease, and Madame Carnot.

A card of commendation was awarded to Mr. W. A. Cook, gardener to Col. Simpson, Shirley House, for a dish of Catillac Pears.

### National Chrysanthemum, October 26th.

At the meeting of the Floral Committee held on this date, at the Essex Hall, Strand, a goodly number of new varieties were submitted for the consideration of the committee. The change from the semi-darkness of the late Aquarium to the clear roof light of the Essex Hall is much appreciated by committee and exhibitors. Mr. D. B. Crane occupied the chair, and there was a good attendance. First-class certificates of merit were awarded to

*Incurved, Mrs. J. P. Bryce:* a large white variety, of excellent petal and symmetry, something in the way of Duchess of Fife, but said to be quite distinct from it. From Mr. W. Godfrey, nurseryman, Exmouth.

*Japanese, Maude du Cros:* pale yellow, with sulphur white reverse. Six blooms of this variety were shown, all even, large, full, deep, and attractive, the long and fairly broad florets curving somewhat at the tips. From Mr. T. Bullimore, The Gardens, Canons Park, Stanmore.

*Incurved, Miss E. Holding:* having a pale rosy purple base, with a silvery reverse, but little of the surface colouring can be seen, the incurved florets folding over and forming a compact cone. From Mr. W. Seward, The Firs, Hanwell.

Mr. Godfrey staged also some blooms of Jap Exmouth Rival, brilliantly coloured, and most telling. The difficulty appears

to be to get it deep enough for exhibition size; commended. He also had Col. Wetheral, a broad petalled Jap of a deep, bright, golden yellow colour, and of good promise. *Incurved, Devenshire Hero,* a bright, deep yellow variety, not sufficiently developed, and which the committee wished to see again; also Wiltrid H. Godfrey, a bright orange chestnut incurved Jap, with amber reverse.

Mr. Thomas Mudd, The Gardens, Thorneywood, Northampton, had Thorneywood, a promising exhibition Jap, colour pink, suffused with delicate lilac, the broad florets curving at the points; this the committee wished to see again. Mr. D. H. Fairweather, The Gardens, Bifrons Park, Canterbury, sent Jap, Mr. John Reeve, deep pink, suffused with lilac and delicate purple, with a silvery reverse, a broad petalled flower of promise; and Mrs. John Reeve, blush white, somewhat conical shaped, a little rough as shown. Mr. Geo. Mileham, Emlyn House Gardens, Leatherhead, sent Jap, Emlyn Gem, orange and ruby salmon, with amber reverse; and Harry Greenfield, bright deep chestnut crimson, with broad florets slightly reflexing.

Mr. T. Bullimore also staged Philippe du Cros, pale orange red, with amber reverse, a large incurving Jap; and Denise du Cros, said to be a reflexed sport from the preceding, and of a dull orange chestnut colour. Mr. George Carpenter, West Hall, Byfleet, had Miss Florence Eva White, an incurved Jap of good petal and substance; and Miss E. Fisher, a broad petalled blush white variety, creamy and lemon in the centre. Mr. J. C. Geiselbrecht, Beechdale, Lee, S.E. (George Judge, gardener), sent Mrs. George Judge, a broad petalled delicate pinkish rose variety, bright in colour, and decidedly promising. Mr. W. Seward, Hanwell, had incurved Mrs. E. Leggett, lilac, with silvery reverse, broad petalled. Mr. C. Penfold, The Gardens, Leigh Park, Havant, had a bold and striking white named Lady Pearce, pure in colour, broad petalled, and likely to make a very acceptable addition to the white Japs. Mr. C. J. Ellis, Warren House Gardens, Stanmore, sent Mrs. Bischoffsheim, having orange salmon and pale ruby basal petals, with rich deep gold centre, very showy, a variety likely to improve with cultivation. —R. DEAN.

### The Royal Botanic.

The Royal Botanic Society of London have again succeeded in obtaining a remarkably beautiful display of Chrysanthemums in the conservatory at their gardens in Regent's Park. The general practice of the society is to grow, not for purposes of show, but for conservatory decoration. But a desire for something of the nature of an annual exhibition of Chrysanthemums was expressed about six or seven years ago, and consequently the society has paid special attention to the cultivation of these flowers, and have so far improved their collection that there has been a manifest advance every year. The collection is grown exclusively in the gardens of the society, whose officers have made it a special object to secure new varieties as they have come out, and to keep their collection well up to date in this respect. Attention may fitly be directed to the excellent arrangement of the conservatory, not only as regards provision for the healthy growth of the plants, but for purposes of display. The conventional method of packing a large number of blooms close together is here avoided. The Chrysanthemums are lightly arranged between foliage plants, chiefly Palms and Ferns, and also Asparagus. The plants thrive better, and the effect upon the eye is excellent; each individual colour is seen to the best advantage.

### Beckenham Horticultural.

On Friday, October 23, Mr. F. W. Shrivell, F.L.S., lectured to a large audience on "Experiments with Manures on Bush and Other Fruits," as carried on at the Hadlow (Golden Green) Experimental Farm. Strawberries first claimed attention; the best results were obtained by the use of a light dressing of dung, twenty-five loads to the acre, supplemented with 4cwt of superphosphate and 2cwt of nitrate of soda. Currants, Gooseberries, Apples, Damsons, and Cob Nuts were treated on instructively. The lecturer held out no hopes of a cure for the Black Currant mite, which has evidently "come to stay." As a remedy for the Gooseberry caterpillar, syringing with a solution of softsoap, 8lbs to 100gals of water, was recommended. Cob Nuts manured with superphosphate, potash, and nitrate of soda were said to have realised better prices than those grown without them, the Nuts having a better appearance by reason of a longer "cupule" or beard. Spraying was remarked upon for fruit trees, Potatoes, &c., the lecturer suggesting that societies should possess machines that could be let out on hire to members for a small sum. He also urged the importance of care in the matter of weight and measure of ingredients for spraying. Some well grown Begonias Gloire de Lorraine were contributed by Mr. Cole, and some remarkably fine Ailsa Craig Onions by Mr. Webster; to each was awarded the society's certificate of merit. At the close, Mr. Shrivell was heartily thanked for his able and instructive lecture.—T. C.

## United Horticultural Benefit and Provident.

The seventeenth anniversary dinner was held in London on October 27th ult., when Mr. Peter Barr presided over 111 members and visitors. Having honoured the loyal toasts, Mr. Barr proposed success to the society. He observed that the membership was now 1,040; what would the work be when the numbers amounted to 10,000? He thought it probable that the society might some day have rooms of their own in the City [why not in the new horticultural hall?—Ed.], with a large staff of clerks doing the work. He had gone through the rules, and thought some of them obscured; but having brought the matter forward, these rules were now in process of being re-written. Mr. Barr, as a nurseryman, had never known before that this branch of the horticultural army of workers were entitled to join the society. In order that the nursery employes at Long Ditton might have the matter brought before them, he had caused the rules to be sent to the foreman there, and had asked him to explain them to the other workers. Mr. Barr suggested that a leaflet be prepared and sent to the various seedsmen and nurserymen throughout the country, stating the advantages derivable, and that nursery employes were eligible. The single-handed gardeners might be reached through clergymen, and other leaflets might be sent direct to park superintendents and head gardeners. Having had statistics prepared, Mr. Barr was able to say that 948 members were in England, eighteen in Wales, seventeen in Scotland, twelve in Ireland, and one each in South Africa and Germany, and four in America.

He urged the officials to work Scotland more, even though "Sandy's" weakness was to have societies of his own. The chairman went on to say that nowhere during his travels had he found any similar self-help society. However, as the English gardening papers are read in various parts of America and Australia, the idea of a self-help society will be carried far abroad. And the women gardeners are equally eligible with men to become members of the "United."

To this toast Mr. James Hudson, the treasurer, responded. He did not think the Scots were likely to form a gardeners' self-help society, as had been hinted. They were too canny for that, and preferred to join one that had money. The "United" (the good ship "United," as he called it) had sailed since 1865, and though progress was for a long time slow, its advance was now ensured. The officers had it well equipped, and managed it to the interests of all, and the sum of £22,000 (invested capital) as ballast, would keep it steady. Mr. Hudson was glad to know that gardeners, especially young gardeners, were making use of its advantages, and he urged them more and more to give it consideration. It had been a common excuse with some that they had never heard of it. All he could say was that if that were so, they did not read the gardening papers. He wished them to compare the "United Horticultural" with the Hearts of Oak, the Oddfellows, and others.

In a well considered and admirably delivered speech Mr. A. J. Brown, of the School of Handicrafts, Chertsey, introduced a toast to the Honorary and Life Members. He had attended the annual meeting in the spring, and was much surprised to find only a very few members there. It were well if benefit members would take greater interest themselves, and he felt sure that honorary members would not be a-wanting. Mr. Sherwood, who founded the Good Samaritan Fund, was an exemplary honorary member, and that act of generosity was a grand testimonial to a good man.

The remaining toasts having been given, the meeting dispersed at ten o'clock.

### Bristol Gardeners'.

"Hardy Fruit Culture, Past and Present," was the subject of a lecture given before the Bristol Gardeners' Association on Thursday last, the lecturer being Mr. J. Basham, jun., representing the Newport Gardeners' Society. A goodly number of the Bristol gardening fraternity availed themselves of the opportunity to hear such an authority on hardy fruits. Mr. Basham, sen., occupied a seat on the platform, and was

Pear, Passe Colmar. (See page 422.)

cordially welcomed by his fellow gardeners of Bristol. Prizes for six culinary Apples were awarded to, first, Mr. J. B. Brain (gardener, Mr. Atwell); second, Lady Cave (gardener, Mr. Poole); third, Mr. G. A. Wills (gardener, Mr. Barwell); and an extra one to Mr. Gilbert Howes (gardener, Mr. White). A certificate of merit was also awarded to Mr. Gilbert Howes for three *Odontoglossum grande*. Mr. Basham staged a collection of a score or more dishes of Apples, which were much admired and appreciated. The chairman for the evening was Mr. E. H. Poole.—H. K.

### Newport (Mon.) Gardeners'.

The usual meeting of the above association was held on Wednesday last, when Mr. J. Reece, of Wonastow Court, Monmouth, read a very interesting paper on "Leaves and Their Functions." Mr. Reece, in his paper, said that leaves played a very important part in decoration, and were of many forms, the simplest being found amongst Mosses, varying in colour from shades of green to white, yellow and red. Small leaves were produced in the greatest profusion. Leaves acted as lungs to the plant, absorbing carbonic acid and water from the atmosphere, and exhaling oxygen, the under surface of the leaf doing most of the work, and the sap supplied by the roots being elaborated by the leaves and returned to the stem. Mr. Reece illustrated his paper by diagrams of the cells of leaves, also of the different forms of the veins, also of the leaves showing the various shapes. A discussion followed, in which Messrs. Woodward, Wiggins, Daniels, Taylor, Powell, and others took part. Mr. Reece was accorded a very hearty vote of thanks for his able and interesting paper. Mr. J. Duff presided over a good attendance.—J. PEGLER, Hon. Sec.

### Birmingham Gardeners' Association.

"Florists and Floriculture of the Past Fifty Years" was the title of a very interesting lecture on the 19th inst., by Mr. Richard Dean, V.M.H. Mr. Dean, in his customary graphic style, gave a review of the principal florists of the past half century, coupled with the special productions of each. A report of a lecture on this subject appeared in the Journal a year ago, extending to two or three issues.

### Cardiff Gardeners.

The second meeting of session took place at the Grand Hotel, on Tuesday, October 20, Mr. H. R. Farmer presiding over a large attendance. Mr. F. W. E. Shrivell, F.L.S., delivered a lecture entitled "The Use of Chemical and other Manures in Horticulture," illustrated with lime-light slides. The best thanks of the meeting was accorded Mr. Shrivell for his most interesting lecture, to which he briefly responded. It was announced that on November 10, Mr. H. R. Farmer, Cardiff Castle Gardens, would deliver a lecture on "Vines."—J. J.

### Fruit Forcing.

**CUCUMBERS.**—Autumn fruiting plants are now in full bearing, and having plenty of stamina in them, and not being overcropped, will continue to bear good fruit a considerable time longer. It is also necessary to remove the fruit as soon as it becomes a usable size, and all deformed fruit when seen, as these needlessly weaken the plants. Attend to the plants once or twice a week for the removal of bad leaves, stopping irregular growths and cutting out superfluous, keeping the foliage moderately thin. If mildew appear dust the affected parts with flowers of sulphur, or form this into a paste with skim milk, and brush a little on the hot-water pipes. The fumes given off act against red spider and white fly, but aphides and thrips should be subdued with vapourisation of nicotine essence, or fumigation with good tobacco paper, or the advertised substances, which are generally safe and thoroughly effectual. Winter fruiting plants are far the most difficult to manage; the great thing is to get them well established and furnished with sturdy growths and thick, leathery leaves, letting the shoots advance well up the trellis before stopping them, training the growths evenly, and not more closely than to allow of the foliage being well exposed to light. Stop the side growths after a few good leaves are made, and the shoots issuing from the wood left will show plenty of fruit, and such may be stopped one or two joints beyond it. This will secure foliage for accelerating root action and the proper nourishment of the fruit. To insure the fruit swelling it is sometimes necessary to have recourse to fertilising the flower; but allow few or no male blossoms or tendrils, removing them as fast as they appear, for they only weaken the plants. Add fresh soil to the ridges or hillocks as the roots protrude, and be careful not to over-water, affording a supply only when needed. The water or liquid manure applied should be warm to the mean temperature of the house.

**PEACHES AND NECTARINES: EARLIEST FORCED TREES IN POTS.**—For securing very early fruit, the trees are unquestionably best grown in standard form in pots, and the stems varying in height, so that they will accord with the incline of the structure, and thus have the heads well up to the light. The very early varieties do well under this method of culture, as from the pinching they have blossom buds on the young wood, and these are not liable to drop as are those on the first made wood of the previous year through over-development. A three-quarter span-roof house, facing south, provided with top and front ventilation, and four rows of hot water pipes, two along the front and two next the path on the front side of the house, cannot be bettered for early forcing, the back wall being utilised by growing Tomatoes against it; and when the Peach trees are withdrawn, as they may be after the weather becomes settled in June, the front of the house can be occupied with Tomato plants grown in pots for the purpose.—**ST. ALBANS.**

### Kitchen Garden.

**ASPARAGUS BEDS.**—Now that the yellow stems of the plants indicate that their work is done for the season, the work of cutting them down closely to the ground may be proceeded with. The growth of weeds, too, in many cases has recently been free and luxuriant. Owing to the continued wet it has been difficult to check them, but now in clearing the beds they should also be dealt with. Many of them can be pulled up, but some which are deep rooting and of a perennial character will require forking out. Having cleared the beds a mulching ought to be spread over alike to protect and enrich the ground. Short, decayed manure, mixed with a little leaf soil, is suitable, spreading it not more than 3in thick.

**POTATOES.**—The stock of Potatoes now under cover should be looked over, so that the best only may be selected and preserved. In doing this it is necessary to keep a strict look-out for diseased tubers, as the presence of these will quickly cause more to be affected. Small tubers at the same time should be picked out, the best of them being used for mixing with the food of poultry or pigs. It is important to keep the tubers intended for table use protected from frost and covered from light. Store them in any dry, frost proof structure, and cover with straw, dry mats, or bags.

**SEED POTATOES.**—It is desirable to make an early selection of these, taking especial care to save only sound, untainted specimens, which shall be of good shape and medium in size. The preservation of them is a matter of importance, arranging them thinly in shallow boxes, which may be placed in a light and notably cool position, but safe from frost. Seed tubers

are also kept in bags. The method of storing them in shallow boxes is adapted chiefly for early varieties which are sprouted before planting.

**CABBAGES.**—The old stumps which are worth retaining should be cleared now of large and yellow leaves. Also rake the ground beneath the plants clear of rubbish. Take the opportunity of hoeing between young plants in dry weather.

**PREPARING MANURE FOR MUSHROOMS.**—A sufficient amount of short horse droppings should be collected and kept dry, preventing them heating until enough are at hand for all to ferment at once. The material may then be thrown together in a heap and encouraged to ferment, which it will do if duly moist, in the course of a day or two. On becoming hot turn the heap over, placing the inside out and the outside in. If this is repeated once more the manure should then be in a right condition, having lost its fiery state, to form into a bed.

**CELERY.**—During the continued wet which has lately been prevalent it has been difficult to finish the earthing of the late crops. Under drier conditions the work may be done. Pack the soil well round the plants, and when finishing make the sides steep, so as to carry off the wet away from the plants. The Celery fly has been very destructive in some places this wet summer and autumn. In the worst cases all the green tissue of the foliage has been completely eaten up. A check should be given the pest when the first larvæ are seen at work in the leaves. With a little patience and persistence in crushing them they can be kept down at first.

**SPINACH.**—Make a final thinning of the autumn sown Spinach. Plants short and sturdy, and not crowded, will stand the winter best. Keep the ground clear of weeds.

**BEEF.**—Beet roots not yet out of the ground should be lifted forthwith, dried, and then stored in sand or ashes in a cool shed.

**ENDIVE.**—The driest opportunities possible should be chosen for covering full grown plants of Endive for blanching. Pots inverted over and the drainage hole covered with a slate to exclude light will prove, perhaps, to be better than placing a slate directly on the plants.—**EAST KENT.**

## Weather Notes.

### Cyclone in Berks.

On Sunday last, October 25, we were visited with what one might call an "American" cyclone. It came up from the south-west, across the Coombe Hills, with terrific force just before 8 p.m. One could hear numerous trees snapping and falling, but owing to the darkness I could not see what damage was being done. After it became quiet I ventured out with a light to see that the glass was safe. That, excepting the conservatory, was all right, but the latter had part of its roof stripped off. It was the park, however, that had the full force of the storm. Trees are down everywhere, Elms, Oaks, Ash, Limes, and Cedars. It is impossible to give the correct number of trees that have fallen. The local paper gives the number of 267. I think, when cut out, there will be even more than that. Considerable damage was done also to house property in the village; while the Bath Road was rendered impassable by trees and fallen telegraphic wires. This storm seemed to put the last straw upon gardening after such a bad season.—**JOHN H. SIMMONS, Foreman, Barton Court, Kintbury, Berks.**

### Rainfall at Camp Hill, Woolton, Lancs.

It may be of interest to some of your readers to know the amount of rain which has fallen in this district during October. We have registered here for the month 7.09ins. The rainfall for October, 1902, was 3.73ins, being 3.36ins less than this year. The heaviest was on Tuesday, the 27th, the rain gauge registering 1.42ins; on the 7th, 0.60ins; and on the 6th and 12th, 0.48 fell on each of those days. The total rainfall for the present year up to October 31 is 34.32ins.

	Rainfall,	Days with out
	1903.	rain.
January ..	2.14 inches	14
February ..	2.09 "	11
March ..	3.47 "	9
April ..	1.70 "	17
May ..	3.48 "	11
June ..	1.76 "	22
July ..	3.30 "	16
August ..	4.16 "	5
September ..	5.13 "	10
October..	7.09 "	2
	34.32	117

304 days of the year : 117 days without rain ; 187 days with rain.

—**J. STONEY, The Gardens, Camp Hill, Wootton, Lancashire.**

### The Month of October.

In this part of the kingdom the almost continuous falling of rain was unprecedented in the memory of anyone living. During the month there were only two days on which rain did

not fall, and in consequence these were the only days on which any corn was cut or gathered. And during the month about 8ins of rain fell. This is phenomenal, especially so for October, which, as a rule, is not a wet month. The foliage keeps green. Still, many trees are partly denuded, as much by the stress of recent wind storms as by natural causes. The temperature, upon the whole, has been high, with the result that growth in soft wooded subjects was unchecked. Outside things, such as Dahlias, are still flowering as if in the month of August.—D. C., Hamilton, N.B.

#### Sussex Weather.

The total rainfall at Abbots Leigh, Hayward's Heath, for the past month was 7.21ins, which is 3.61ins above the average. The heaviest fall was 1in on the 12th; rain fell on twenty-seven days. The amount of rain this month has been exceeded twice in our record of twenty-three years, viz., October, 1880, with 8.23ins, and 1891 with 7.83 ins; but it has broken the record as to the number of days on which rain fell. The maximum temperature was 67deg on the 3rd, the minimum 33deg on the 24th and 31st. Mean maximum, 59deg; mean minimum, 46.01deg; mean temperature, 52.50deg—3.85deg above the average. "Too wet for anything" has been the general verdict on October. Much work in arrears, and vegetation not in a good state to resist hard frost should it occur.—R. I.

#### Temple House Gardens, Great Marlow, Bucks.

The register of rainfall here for the month of October, 1903, was 8.83ins, and for October, 1902, 1.79ins. During the past month rain fell on twenty-nine days; quite a deluge during the night of the 27th and early morning of the 28th, when 1.26ins was registered. There were four foggy mornings, viz., on the 1st, 8th, 24th, and 31st; thunder on the 1st and 22nd; heavy thunder and hailstorm on the evening of the 25th; thunder on the 26th; and heavy hailstorm on the 15th. There were rough winds on the 5th, 6th, and 16th, and a gale on the 25th. The maximum temperature for October, 1903, was 66deg on the 1st, and the minimum 32deg on the 30th. The maximum temperature for October, 1902, was 64deg on the 10th, and the minimum 30deg on the 18th. We are situated close to the river Thames, 105ft 9ins above sea level, and our average yearly rainfall is 27.50ins.—G. G.

#### Heavy Rainfall at Alton, Hants.

The rainfall as registered at Rotherfield Park for October has been exceptionally heavy. Total for the month, 11.37ins, more than double the quantity that has fallen in any previous month of the present abnormally wet year. It rained every day except three, viz., 13th, 17th, and 30th. Our heaviest fall was on the 11th, when 1.90in fell. Over an inch also fell on the 27th, when we registered 1.21in. For the ten months ending October 31 the total rainfall here has been 42.54ins.—WILMOT H. YATES, Rotherfield Park Gardens, Alton, Hants.

This short weather note, being of more than ordinary interest, I venture to send it for the Journal. Rainfall for the month of October: Total of 10.17ins, falling on twenty-seven days. The greatest fall was on the 11th, 1.54in.—E. PLATT, The Gardens, Borden Wood, Liphook, Hants.

## THE BEE-KEEPER.

### Hive Roofs.

It is most important that hive roofs should be watertight, and they should receive particular attention at this time of the year. It is highly probable that more colonies are ruined and more weaklings come through the winter caused by the dampness of quilts than from starvation. Evidence of leakages in roofs may be obtained by examining the quilts after a wet spell, and any hives which are suspected should have the roof removed some fine warm day, and the upper quilts, if wet or damp, replaced by dry and comfortable ones. This, if done carefully, need not disturb the bees. Dryness is essential to prosperity. If the damp penetrates through cracks it may be stopped by putting pitch along them, and then covering with a sheet of brown paper, over which rub a heated iron. The heat melts the pitch, and it runs and fills all crevices splendidly, and is very inexpensive. Putty, after exposure to the weather, very often dries and falls out, and sawdust and glue paste for the purpose is seldom satisfactory. If the roof is past the pitch method of renovation it must be covered with sheet zinc, turning the edges under and nailing on the under side. The reason why nailing on the under side is advisable is to avoid nail holes on the upper side, which, no matter how small they may be, allow the rain to percolate by what is termed capillary attraction.

Of course, damp may arise through the kind of wood used in the construction of the hive, some being more porous than others, and consequently less suitable for hive making. There is, however, no doubt that all hives should be painted once a year. One of the few deadly diseases to which bees are liable, viz., dysentery, is often caused by dampness and lack of sufficient ventilation. The latter is ensured by having cones or holes in the roof back and front, which will allow a circulation of air around the quilts, thus permitting the noxious vapours generated by the bees to pass from the hive. If there is no upward ventilation the quilts become damp, and not only do the quilts become wet, but the inside walls of the hive, and for this reason, therefore, it would be quite wrong to prevent ventilation, like some apiarists do under the misapprehension that they are thereby retaining the heat.—E. E., Sandbach.

The weather has again been dull, with rain on five days.

\* \* All correspondence relating to editorial matters should be directed to "THE EDITOR," 12, MITRE COURT CHAMBERS, FLEET STREET, LONDON, E.C. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense. In naming plants we only undertake to name species, or well-marked varieties, and only six on any one occasion. Florists' flowers we do not name.

**INSECT: IS IT INJURIOUS TO CYCLAMENS? (H. K.).**—The insect is one of the Springtails, evidently *Achorntes purpurascens*, and is probably induced by the leaf mould or other decayed matter in the compost. It is to a certain extent injurious, but commonly does not exist in such number as to cause material injury, though in hotbeds it sometimes causes considerable harm by rasping the stems of seedling Cucumbers and other plants. Lightly dusting air-slaked lime in the soil is a good means of riddance.

**PROPAGATING WHITE LAPAGERIA (A Reader).**—White *Lapageria* (*L. rosea alba*) is usually propagated by layers. Strong, firm shoots, when layered and covered with soil, producing fine young plants, the operation may be performed in the autumn or spring, rooting being facilitated by notching below a joint and thus secured and covered with soil. It may also be raised from seed sown, soon after being gathered, in a sandy peat soil, and kept in a moderate heat. Where *Lapagerias* are raised in quantity, beds of suitable soil are prepared, the parent plants placed in them, and the shoots pegged down. A moist, medium temperature is maintained, and when young plants are sufficiently established they are detached and potted.

**ROOTS OF VINES DECAYED (Grapes, Onward).**—The roots are certainly quite dead and in a state of decay, also infested by the mycelium of some fungus, but whether that of *Agaricus* (or, properly, *Armillaria mellea*) meleus, as you suppose, we are unable to say, in the absence of ascophores or other definite form of fructification. There is no remedy but the fire for roots so far advanced in decay, and unless the Vines have some living roots, it would be advisable to uproot them altogether and plant new Vines in entirely freshly made borders. The cause is, no doubt, a bad condition of the border, it being of too close, too rich, or unsuitable materials—hence sodden and sour, the drainage, perhaps, not having been efficient.

**GRAFTING ORANGE TREE (X. Y. Z.).**—It is too late to graft, as the stock will be at rest. The best time is when the sap is in motion, say in spring up to August, side grafting being practised, the scion having its lower end placed in a phial of water to keep the leaves fresh until the union is complete. The usual mode of propagation is by budding performed in August, young plants being placed under a handglass after the operation. In the course of a month the union will be complete, when loosen the ligature and remove the top of the handlight. The budded plants should be headed down in spring, three inches above the buds, and if the pots are plunged in a hotbed the buds will start and make shoots two feet or more long by August, when they should be gradually hardened off.

**SHOOTS OF YEW DISCOLOURED (Reay, Surrey).**—The shoots are affected by the disease known as "Yew-leaf redness," which is produced by a fungus closely allied to, if not identical with, that causing "Spruce-leaf redness" (*Hysterium macrosporum*). Its presence may be detected by the leaves of the previous year's shoots turning brown in May, or possibly not till autumn, and by the invariable occurrence of abundant mycelia in the leaves even before they become brown. Leaves which change colour in spring reveal the commencement of the formation of perithecia in July of the same year, and these ripen next spring in April and May. At that time they are present on the two-year-old shoots. This is the case in a wet season, when, owing to the humid atmosphere, the disease is of rapid development. Under drier conditions, on the other hand, the leaves on two-year-old shoots do not become brown till October, and the formation of perithecia begins on three-year-old leaves in June of the following year, the spores ripening in the succeeding March or April. On the two-year-old leaves there are some blackish pustules, now somewhat rounded, but ultimately they become elongated, yet not so long and straight in the case of affected Spruce leaves. The perithecia are produced on the under side of the leaves. The whole of the leaves on an affected shoot are usually brown—that is, the two-year and one-year-old leaves—but the "fruits" only appear on the two-year-old leaves. The only repressive measure known is to cut off the affected growths and burn them, which should be done by or before March.

**POINSETTIAS DEVOID OF BRACTS (H. K.).**—As the beauty of *Euphorbia* (syn. *Poinsettia*) *pulcherrima* resides in the bracts with which the flowers are surrounded, it is very tantalising to have the plants practically bractless, as in your specimens. The defect usually arises from defective maturity of the wood or its solidification during formation, and this appears the only reason for the condition of your plants, the dull, wet season not favouring the sturdy, short jointed, well solidified growth so essential for the production of fine heads of bracts. As the object is to produce a large terminal head of bracts, the plants should be grown as sturdily as possible, an intermediate house answering well in ordinary seasons; but in such as the recent summer the plants are liable to become softer than usual, and in consequence would be liable to suffer from an ordinary fumigation that under a harder condition of the growth would not be injuriously affected. The plants will not bear a low temperature in autumn, the result being invariably the loss of either the lower leaves or bracts. When the bracts appear, more heat and some manure water may be applied to expand them. Retaining the foliage in good condition throughout the season is one of the main provisions for securing the full development of the flower heads. Sudden changes of temperature in either direction must be avoided, and the plants exposed to plenty of light and full sunshine, except when it is very strong, in summer.

**TEA AND HYBRID TEA ROSES PLANTED OUT IN GREENHOUSE (Rosa).**—The first thing to be attended to is the drainage. A foot depth of rubble should be provided, and the bottom of this fall to a drain having proper incline and outlet. The roughest material, half-brick size, should be placed at bottom, and diminishing to road metal size at top; over this a layer of old mortar rubbish, two or three inches thick, may be placed. Thus water cannot stagnate around the roots of the plants, and they will receive the air or warmth the soil needs and is essential for health. The soil in which Roses succeed well is composed of two parts of stiff, turfy loam, broken up but not sifted, two parts manure (preferably road gatherings laid by for a season, or the remains of a hotbed, not too far decomposed, and to which is added a third part of its bulk of road scrapings), and one part charred earth or sand. This compost should be thrown up in a heap in autumn, and turned two or three times during winter, and a little air-slaked lime and soot scattered throughout to destroy or drive out worms and grubs. It should be used to a depth of two feet and made tolerably firm, always making up the border when the material is in good working order—neither too wet nor too dry. The Roses may then be planted, early in spring being a good time, just before or when they are starting into growth. We presume you intend the plants as climbers, of which *Alister Stella Gray* (N.), light yellow; *Belle Lyonnaise* (T.), deep canary yellow, tinted with rose; *Bouquet d'Or* (N.), deep yellow, coppery centre; *Céline Forestier* (N.), pale yellow, deep yellow centre; *Cheshunt Hybrid* (T.), cherry earmine; *Lamarque* (N.), lemon yellow; *Gloire de Dijon* (T.), yellow, shaded with pink; *L'Idéal* (N.), yellow, with metallic tints of copper and gold; *Madame Berard* (T.), clear light rose; *Maréchal Niel* (T.), deep yellow; *Reine Marie Henriette* (T.), bright crimson; *Solfaterre* (N.), sulphur yellow; and *William Allen Richardson* (N.), orange yellow; *Climbing Devoniensis* (T.), creamy white, tinted rose; *Climbing Niphetos* (T.), white or pale yellow; *Climbing Perle des Jardins* (T.), straw yellow; and *Climbing La France* (H.T.), rose lilac, are good. From the foregoing you may select according to taste for colour and requirements, the plants not being nearer than 3ft. and are better 4½ft distance apart, given full run of rafter and trellis, not further from glass than 1ft. The plants, all points considered, are, perhaps, best on seedling Briar. If you require dwarf plants for growing as bushes or pyramids, you cannot do better than select from the tables given in our columns of October 29, page 392.

**Trade Note.****Messrs. W. Bull and Sons.**

Messrs. William Bull and Sons, new plant, seed, and bulb merchants, of King's Road, Chelsea, have appointed Mr. George H. Sage, late head gardener to the Most Hon. Marquess Camden, at Bayham Abbey, Lamberhurst, as one of their representatives.

**A New Departure.**

Lord Onslow, our new Minister of Agriculture, has a novel scheme in hand. On paper it looks remarkably well—it may be some years before he can speak of its actual practical value. We have the Board of Agriculture at Whitehall. To many it is only a name; to many more it is not even a name, as they have no idea that such a thing exists, much less do they know anything of its functions. Now this may seem rather a sweeping statement, but, nevertheless, it is the perfect truth. Take an average agricultural district with a mixed farming population. By that we mean a district where large farms and small holdings are pretty fairly divided. The small holdings are in the hands of men who have risen from the ranks of those who have actually followed the plough—the best men who have seen service (active) under the large farmers, and there saved money to enable them to start on their own account. Now, in the case of the large farmer we find he is probably a member of the County Chamber, an active spirit on the committee of the County Show, almost without exception a member of the "Royal," or some kindred society, or of both; a subscriber to at least one agricultural paper pure and simple, and a daily reader of some good county paper with an agricultural side. He receives most, if not all, of the little leaflets published by the Board, and is also in receipt of all the latest agricultural pamphlets and journals, English and foreign, which abound.

Now look at the small man. He gets a weekly paper. There may be a paragraph touching on farm work in his own immediate neighbourhood. There will be some instances, especially at this season of the year, of gigantic Potato yields sold at abnormal prices. The facts would find no admission into the paper were they not sensational. If he lives in or near a village he may see in the reading room a copy of an agricultural paper. (We know several village rooms where one is not taken.) If he lives in an isolated place, he sees nothing. He knew of the "Royal" in past days, because occasionally it visited some large town in his neighbourhood: now it is a thing of the past, for Park Royal is quite out of his reach. He knows nothing of his privileges under the Fertiliser and Feeding Stuffs Act. He may occasionally know something about the Milk Act if he should unfortunately be caught selling milk deficient in butter fat. That is brought home to him very forcibly before a magistrate, but he has no idea how to get at the amount of butter fat for himself. He is the man who ought to have every leaflet that is printed. They should be distributed by hand, with a personal request that they be read and studied, and a clever colporteur might easily add a few words of explanation when he found the subject a little beyond the ken of the receiver.

Up to now there has been a great difficulty in getting into touch with these small farmers—men who are really of such immense value to the country. They are shy and unapproachable, slow of speech, and very unwilling to allow, or admit, their ignorance with regard to the scientific side of their profession. They are the class who most need teaching and who get the least, simply because the authorities do not know what they want, and do not know how to get at that knowledge.

It cannot be done from headquarters. It will have to be ascertained locally, and to this end it is proposed to have all over the country, men versed in matters agricultural, who will from time to time communicate with Lord Onslow and his staff, and keep them posted up as to the wants of the agriculturists generally. The men appointed must be such as have the full confidence of their neighbours, and will be in a position to know intimately those facts to which it is desirable to call attention. There will be a very nice discrimination needed in the choice of these men; and if the right men are chosen they will be very powerful for good.

Now, we hardly like to take upon ourselves to say what men should be chosen; but we think, without offence, we should suggest that no land agents are on the roll. A land agent is difficult to class. He is supposed only to have at heart the interests of his employer, and he is looked upon with more or less suspicion by the farmer. It is with him so many difficulties occur, and at the best of times and with the best men we can only describe the situation as one of "armed neutrality."

These, then, are not the men to whom a struggling farmer would come in any difficulty. We want educated men, genial men, and men with very judicial, even temperaments. A popular landlord might be a most valuable auxiliary, and we know of one or two the very men. Then there are some large tenant farmers we could mention, only the difficulty with them is that their hands are already very full; it is, however, just such men who can generally make time to do a little more work, especially if it be work for the good of others.

Lord Onslow through his secretary, Sir T. H. Elliott, makes several suggestions as to the class of information that should be gathered and laid before the Board at Whitehall, and we think we cannot do better than quote them verbatim.

#### I.—PRODUCTION.

I. Losses arising from the use of unsuitable, defective, or worthless seed.

II. Difficulties in connection with the selection and use of fertilisers, and complaints as to their quality or failure.

III. Losses arising from the attacks of insects, and diseases affecting crops.

IV. The suppression of weeds.

V. The partial or complete failure of crops from exceptional causes.

VI. The growth of new crops and new methods of cultivation.

VII. The practical value of new implements and machinery.

VIII. Difficulties in the treatment of orchards and garden produce.

IX. The deterioration and possible improvement of pasture.

X. New and special methods of dairying and new descriptions of produce.

XI. Difficulties in the breeding and feeding of live stock.

XII. Complaints as to the quality of feeding stuffs.

XIII. New descriptions of feeding stuffs.

#### II.—DISTRIBUTION.

XIV. Inadequacy of railway and other facilities for transit.

XV. Complaints as to railway rates.

XVI. Difficulties at markets with regard to tolls and accommodation (including weighbridges).

XVII. Loss of markets at home or abroad, and exceptional decline in prices.

XVIII. Methods of marketing and requirements of purchasers as to quality, packages, &c.

We ask, Can this list be improved? It is as nearly perfect as anything human can be. Whether all these recommendations can be carried into effect is another story. They cover such a wide range of subject there seems to be something to fit every case.

Take the first two instances. What help a clever farmer might give to a less educated neighbour by suggestions as to best place from where to procure suitable, honest seed. These men often spend their money on what is perfectly useless, simply because they become the easy prey to the first unscrupulous dealer they meet, and in case of failure he has a thousand specious arguments, by which he accounts for that failure; anyone or anything is to blame except the rubbish he sold.

In the second case, the happy-go-lucky admixture of manures is something too extraordinary to contemplate. Manure is manure, quite irrespective of the nature of the soil, which it may or may not suit. At this ignorance we need not be surprised, for the best of us are only just learning the A B C of the art.

Take, again, No. IX. It is sad to say, but only too true, that no land is more robbed than pasture land, and no land responds better to generous treatment. The small farmer, cow keeper, and the like needs to get very ounce of good out of his pasture, for, as a rule, he pays very dearly for it. (N.B.—There are others beside the small farmer who neglect their grass land.)

No. X. has been partly approached by the travelling dairymaid, but still in many neighbourhoods we find yet

only butter and milk as the dairy produce, nothing in the way of soft cheeses, which need only to be known to be appreciated. Under No. XI., we think, would come hints as to the better breeding of the dairy cow; that is, with a view to a greater milk capacity. We fancy that few everyday cows average 440 gals per annum, and that Professor Long says, is less than it should be. From our acquaintance with the working man's cow, we see there is much room for improvement. Does he ever consider the question of the necessity of using a bull the product of the best milker of the herd? A bull is a bull, if he has any sort of size or quality; we might say size without quality, often.

XV. suggests another feature. What poor man has any chance of combatting an excessive railway rate? In this case he does want a friend at court just to show what his rights are and what he can fairly insist on. We feel acutely in this neighbourhood (Doncaster) on the subject of transport facilities, and the long promised light railway is still, we fear, in the far future.

No. XVIII. People have yet much to learn as to grading and sorting. We heard of Barley, the produce of a labourer's two or three acres, going off to-day to the buyer just as it came from the machine tail. It does not require the gift of prophecy to predict that in about two or three days' time that old man will come to us asking for advice, as the corn merchant is inclined to throw up the lot. Another old man was grumbling sadly yesterday because he might not send off Potatoes just touched. He could not, or would not, see that before those Potatoes got to the consumer there would be considerably more disease than was desirable. We give this scheme our hearty welcome, and only hope it may fall into the hands of good men who will make it go.

#### Work on the Home Farm.

There is nothing of an agreeable nature to chronicle this week, for the rainy weather continues, and the whole country is a perfect slough of despond. The corn remaining in the fields may be written off as lost, for neither grain nor straw can now be of any value except as manure.

The work of the past week has been two days Potato lifting, and the other four wasted. Even the lighter soils are too wet for drilling with Wheat, even if the weather were fit to turn horses and men out in. On one day we had a thunderstorm and rain, the weight of which we have only once seen equalled.

A neighbour who sold a quantity of Potatoes for forward delivery is sorting them and getting them away. They are Up-to-Dates, and about one-third are diseased, and they are getting worse in the pie. As soon as the Potatoes are all up no doubt farmers will make a great effort to put some Wheat in on the Potato land. If the land could be sown unploughed the work would proceed better, as the seed might be sown broadcast and harrowed in; but there are unfortunately so many Potatoes left in the soil that a careful ploughing is a necessity. There is one comfort; Wheat may be sown very late on a Potato fallow, so we have another month yet. There is one thing we must again impress on our readers, viz., the necessity of sowing dry seed. Where the land is very wet it is inadvisable to sow very bold, well filled Wheat. Small, immature, but dry seed is safe for sowing on sodden land. It would pay to gently kiln-dry seed Wheat which is in bad condition.

As may be imagined, sheep on Turnips are in a very dirty state; but, as a fact, they have been taken off to the grass a good deal lately, as there has been a labour difficulty about getting the roots trimmed and cut for them, in addition to the badness of the lair.

We have seen one heap of Mangolds stored. The owner seemed pleased at having beaten his neighbours, but we question whether the roots were ripe for putting away. It has been too wet for big Mangolds, but they may swell a great deal in two or three weeks yet, and as the crop is much below the average we should certainly give them a chance to do so. It is easy to write like this, however, when we have too many other irons in the fire. Very few cattle have been brought up, but a good many fat and half fat ones have gone to market, for farmers want money badly. The result of full markets has been a very bad trade, and butchers are getting good cattle at their own price.

---

WIRRAL AND BIRKENHEAD AGRICULTURAL SOCIETY (INCORPORATED).—In consequence of complaint having been made respecting the charge for admission to the horse ring enclosure during the society's show, the council has now decided that visitors to the next show, which will take place on June 14, 15, and 16, 1904, will be admitted to a portion of the ring enclosure free of charge.

## PLANTING SEASON

## PAULS' ROYAL NURSERIES

WALTHAM CROSS, HERTS.

12 miles from London. South Entrance four minutes' walk from Waltham Cross Station; West Entrance three minutes' walk from Theobald's Grove; both Stations on the Great Eastern Railway.

## SPECIALITIES:

**ROSES** in all forms, from open ground and in pots. Gold Medals in 1903 from Royal Horticultural and Royal Botanic Societies.

**FRUIT TREES** for the Orchard, Garden, and Forcing House. Hogg Memorial Medal, 1901.

**HARDY TREES** for Streets, Parks, and General Planting. Silver Medal from Royal Agricultural Society of England.

**SHRUBS**, both Evergreen and Deciduous.

**CLIMBING PLANTS**, Hardy and Greenhouse.

**RHODODENDRONS, CAMELLIAS, & AZALEAS.**

**HERBACEOUS PLANTS** in great variety.

**BULBS and SEEDS**, and all Garden Sundries.

PRICE LISTS ON APPLICATION. INSPECTION INVITED. Upwards of 1000 Medals, Prizes, and other Awards at leading Exhibitions during the past 42 years.

SOLE POSTAL ADDRESS—

WM. PAUL & SON,  
WALTHAM CROSS, HERTS.

Rose Growers by Appointment to His Majesty the King.

## CHERRIES—A SPECIALITY!

Awarded Silver Banksian and Silver Gilt Knightian Medals for Collections by R.H.S.

Our collection is complete (over 50 varieties). Thousands to select from, very strong and well rooted. Standards from 12/-, 15/-, 18/- doz.; Dwarf Maidens, three and more shoots, 9/-, 12/- doz.; Dwarf Trained, 2/-, 2/6 and 3/6 each; Dwarfs, two-year heads, suitable for pyramids, 10/-, 12/- and 18/- doz.

LIST FREE ON APPLICATION.

100 Flowering Deciduous Shrubs, in 25 to 50 sorts,	42/-, 63/-, 84/- or 100/-

CLIBRANS  
SELECT ROSES.

OUR ROSES, grown in a cool northern climate, invariably give the utmost satisfaction to purchasers. We make Rose-growing a special feature.

**Dwarf Hybrid Perpetuals**, in choice variety, 6/- to 9/- per doz., 40/- to 65/- per 100. Extra strong, in pots for forcing, 1/6 to 3/6 each, 15/- to 36/- per doz.

**Moss Roses**, in lovely variety, 6/- per doz., 45/- per 100.

**Teas and Hybrid Teas**, in choice and beautiful sorts, 12/- per doz. In pots, 15/- per doz.

**Noisettes**, in finest variety, 10/- and 12/- per doz.

**China Roses**, in select sorts, 6/- to 12/- per doz.

**Polyantha Roses**, 9/- per doz.

**China and Bourbon Hybrids**, in fine variety, 6/- doz.

**Climbing Roses**, in fine variety, 9/- to 12/- per doz.

**Penzance Briars**, a comparatively new, but very beautiful class of Rose, 9/- to 15/- per doz.

**Species of Roses**.—These have now attained a remarkable popularity, particularly for planting in the Wild Garden. We grow all the most suitable, particulars of which will be found in our Catalogue.

Above prices are for our selection only, and are carriage paid to customers' nearest railway station.

CLIBRANS  
SPECIMEN HOLLIES.

WE hold what is, perhaps, the finest stock in the country of specimen Hollies. Perfect in shape, well furnished with foliage, and splendidly rooted.

## INSPECTION INVITED.

**Ilex Aquifolium**.—Grand plants, splendidly furnished, 6ft. to 9ft., 10/6 to 17/6 each. A few extra large specimens, price on application.

**Aq. altaculare**.—An effective, very hardy smoke-resisting variety, splendid specimens, 6ft. to 7ft. in height, 15/- to 21/- each; 160/- to 240/- per doz.

**Aq. argentea elegantissima**.—A very ornamental, silvery-leaved variety, grand specimens, 6ft. to 7ft., 15/- to 25/- each.

**Aq. Hodginsii**.—A grand, vigorous, smoke-resisting variety, perhaps the hardest of all the Hollies, 4ft. to 5ft., 7/6 to 10/6 each; 5ft. to 6ft., at 10/6 and 12/6 each, 120/- and 140/- per doz.; 6ft. to 7ft., 12/6, 21/- each. Larger specimens, 31/6 to 84/- each.

We shall be happy to forward Photographs of Specimen Hollies growing in our Nurseries to intending purchasers. Special Prices for Large Quantities.

Full particulars of the above, and all other varieties of Hardy Trees, Shrubs, and Fruits, are contained in OUR TREE & SHRUB LIST, Gratis & Post Free.

THURSDAY, NOVEMBER 12, 1903.

## The Effects of the Rain.

It is generally agreed that the memory of 1903 stands a very good chance of living in the history of years as a record breaker. Already the meteorological people have not a reliable record that is not broken, and they are now digging up the dead and gone ashes of the past with the idea of finding something that still remains whole; but it is no good: 1903 has apparently set itself out to be the wettest year in the recollection of history or folk-lore, and considering that November and December have yet got to add their little portions, it is quite likely that the misguided object of the year will be effected.

Under ordinary conditions, the leading daily papers are contented to devote a little share of their space every morning to the meteorological forecast for the next twenty-four hours; but now the weather column is an institution every day, and the rain news seems to attract as much public attention as the fiscal problem.

It is interesting to note also how philosophically the public accepts the perpetual downpour. Back in the summertime, when men had not lost hope for fine weather, there were grumbles at the rain, which dashed the hopes of gardeners, and ruined the "gates" at county cricket matches; but that spirit has quite gone out of us. Rain, rain, rain is accepted as being inevitable, and the optimism of those who take any interest in the weather at all has sunk to the very lowest ebb. To add to the cheerfulness of the outlook, some prying person appears to have discovered spots on the sun, and by some extraordinary means they take this as an indication that we are to have no settled weather for the next few years. Personally, I have no objections to anyone discovering sun-spots who likes to look for them, or even arriving at what conclusions they

READERS are requested to send notices of Gardening Appointments or Notes of Horticultural Interest, intimations of Meetings, Queries, and all Articles for Publication, officially, to "THE EDITOR," at 12, Mitre Court Chambers, Fleet Street, London, E.C., and to no other person and to no other address.

like as to what they foretell: but to spring the possibility of having two or three seasons like this on a hopeful community is altogether too bad, and should be at once suppressed.

Taking a serious view of the matter, however, the outlook at present could hardly be more disappointing. Thoughts chase each other back to the disastrous spring, when we hoped that the summer would make up for it; but it did not, and then we hugged ourselves with the thought that we must surely have a fine autumn. October has proved quite otherwise to be the case, and now all hope has gone. What the winter will prove to be seems a matter of indifference, for a spirit of stoicism has come over the community, for which the misfortunes and disappointments of the season are responsible.

First of all, we have had little or no fruit, and though we cannot blame the rain for that, the responsibility rests with another vagary of the weather—spring frosts. Still, if orchards and fruit gardens had returned even a moderate supply of their bounties it would have made up for disappointment in other directions.

Taking the garden as a whole the story of the season appears to be a mixture of good and ill results, and so far as vegetables are concerned, we have ample evidence to show that the kitchen garden suffers much more at the hands of a very dry season than a very wet one. Indeed, with few exceptions, vegetable crops have done well. It is true that in many gardens there is a shortage of root vegetables, such as Carrots and Beetroot, but for some unexplained reason the seeds of these crops failed to germinate, or there would have doubtless been ample growth. The story of Potatoes is not altogether cheerful, on account of the presence of the disease, and those who lifted their crops early have scored a point this year. When disease is prevalent it is considered by some to be the best plan to leave the tubers in the ground as long as possible, as the disease spreads more rapidly after the crop is lifted. If this may be regarded as a rule, then the present season proves the exception, for apart from the fact that the ground has hardly ever been dry enough in October for Potato digging, I am told of many instances where it is hardly worth while going to the trouble of lifting the crop on account of the prevalence of disease. At any rate, I feel relieved that my Potatoes were lifted and stored during the few fine days we had during the latter half of September.

So far as other crops are concerned, we have had an abundance of green Peas and Beans of all kinds, without recourse to the labour of watering and mulching, which adds so much to the labour item in dry seasons. Onions have done well in most gardens, though the rain was doubtless responsible for many glass-raised bulbs running to seed, and after getting over the bad attack of maggot, which checked progress for some time, Celery has grown away rampantly. In all well-arranged gardens there are winter greens enough to stand a siege, though it must be said that the growth is very succulent and the plants would not stand much severe frost. Turnip-growing has been a, b, c this season, simply because we have no opposing force in the shape of "flea," and all through the summer the supply has been unfailing. Some crops have failed us, it is true, as the wet sunless days were disastrous to outdoor Tomatoes, and the cold nights in June checked the progress of Vegetable Marrows. Slugs have been the common bane throughout, and I have never known a season when they have been more troublesome in the kitchen garden. In spite of all things, however, now that we have arrived at a time for general summing up, it may be safely asserted that the vegetable division is the one redeeming feature of a season of disaster.

The story of the flower garden is a mournful one, and I look almost in vain for a gleam of brightness. I have it now, for on a bed in front of me I see tuberous Begonias still gay with bloom. Yes, these plants have saved the situation this year in the bedding department, and have proved beyond doubt their superiority over the older Geranium in a wet season. All the latter plants have made rampant sappy growth, but have produced very little flower, and have been disappointing in consequence, while the weather has been too wet and sunless for subtropical subjects to acquit themselves with any credit. The echo of the rosarian's wail at midsummer, when he looked in vain for blooms for the show, has hardly died away, but the queen of flowers has redeemed her reputation by giving a charming display of autumnal blooms. In fact, these have been

so good and plentiful as to fully merit the idea of the National Rose Society holding an autumn show.

I have reason to complain of annuals, which damped off, ran away to rampant growth, or fell a prey to slugs, but the wet season of 1903 has proved once more the value of herbaceous borders. Most of the inmates of these are never failing, and in rain or shine there is something to look at and something to cut. The cosmopolitan Dahlia has proved that it possesses a secret liking for an abundance of moisture, though late blooms have been scarce for the want of sunshine, and leaf and stem growth on the other hand errs on the side of superabundance. Michaelmas Daisies have been charming, but they would have been better if Old Sol had put in an appearance more frequently; and, at the moment of writing, the outdoor Chrysanthemums are unfurling their flowers in all the front gardens round about. I hope Jack Frost will keep away till the display is over.

Finally, there are stupendous mountains of work looming in front of us, but the daily rain puts the veto on all outdoor operations. Cleaning up is out of the question, and when the autumn digging is to be done, is entirely a matter for speculation. There are alterations to be made, shrubs to be moved, fruit trees to be planted, borders to be renovated, and a score of other operations waiting to be taken in hand; but what can be done when the lower portions of the garden are under water, and the soil elsewhere is a quagmire of mud? No one but a gardening Mark Tapley could be cheerful under existing circumstances, and the aspect at present is quite in keeping with the miseries already suffered in this sodden year.—G. H. H.

## Midland Reafforesting Association.

This association has been formed to promote the reafforesting of waste grounds in the Midlands, particularly in the parts of Staffordshire and Worcestershire known as the Black Country. It is the result of a public meeting held in Birmingham on February 12, 1903. The association has to bring home to the public certain facts. These can only be outlined here; they will be fully dealt with in lectures or in future pamphlets: (1) An enormous area lies wholly waste. (2) Pit-tips and spoil banks are ugly, and should be concealed if possible. (3) The greater part of this waste land can be planted with no great trouble, and will readily support trees of appropriate kinds. (4) Plantations so made will be commercially profitable; directly as producing timber, indirectly as increasing the value of building land in their neighbourhood. (5) The presence of trees, besides being pleasant to the eye, and refreshing to tired workers, will improve the general health of the district.

Can 30,000 acres—that is, roughly, a square seven miles each way—be spared for the mere heaping of rubbish? Yet the waste lands of the Black Country amount to far more than this. The association estimates that quite 30,000 acres may ultimately be planted, and that 14,000 acres are ready for immediate development. It has been too often taken for granted that the Black Country is fated to be ever a desert, but forest trees can grow and thrive upon pit waste, upon furnace slag, and even upon the ash of burnt-out shale. Suitability of soil is not, therefore, in question at all, and it can be asserted, without fear of contradiction, that the sole consideration is the state of the atmosphere. Even then it is not a general smokiness that does harm, so much as actual contact with the sulphurous fumes arising from certain quite local industries. But the atmosphere of the Black Country is not so impure as it once was, and it tends to become purer every day.

In certain places trees have been planted and have failed, but careful investigation has generally shown either that kinds unsuited to the soil have been tried, or that, in ignorance of proper methods of forestry, trees too large have been planted. This latter mistake is the commoner of the two, and it cannot be too often repeated, as being sound forestry, though contrary to the rules of good gardening, that the quickest, best, and cheapest way to grow timber for profit is to sow the seed broadcast, the thicker the better, in the spot where the trees are meant to mature, and to leave it to Nature to thin out the weaklings. No manure or imported soil is needed, nor any preparation save a mere forking of the surface. If, however, it is thought necessary to plant instead of sowing, trees of two years or less should be chosen, and the ground must be broken for a spade's depth under each plant.

The Oak and the Conifers are not suited to the district, but, among other kinds, the Poplar, the Willow, the Ash, and the Sycamore may be relied upon to grow freely. Of these the two last have the highest economic value, tons of the wood being

used locally. No considerable return can be expected for at least fifteen years. Business men are accustomed to a quicker turnover, but there are few businesses with a smaller original outlay, or where the returns are obtained with so little trouble. "Be aye stieking in a tree," said Sir Walter Scott's thrifty Laird to his son, "it will be growing when ye're sleeping." The association adopts the same motto in a modernised form:—"Scatter seeds, Nature does the rest."

The membership of the association is 5s., payable to Mr. W. H. Carder, Tivdale Road, Tipton, Staffordshire, who is honorary treasurer. The President is Sir Oliver Lodge, Kt., M.A., LL.D., D.Sc., F.R.S. Prof. W. Hillhouse, M.A., is chairman of the council, and the general honorary secretary is Mr. Herbert Stone, Bracebridge Street, Birmingham.

## The Liliaceæ.\*

(Continued from page 415.)

The gamophyllous flowered, capsular-fruited section contains about twenty-eight genera and 220 species. About one-half of the species belong exclusively to the Cape of Good Hope; one tribe of thirty species to America, and the remainder distributed over the Old World. Very few of them extend beyond the temperate regions. The first tribe is Hemerocallideæ, comprising five genera, characterised by possessing a panicle or racemose inflorescence.

### INFLORESCENCE A PANICLE.

Firstly we have Phormium (from Plhormos, a basket). This, when grown in large pots, forms a valuable foliage plant, either for conservatory decoration, or for plunging in the flower garden. The flowers are dull red or yellow, and not highly esteemed. The two species are *P. Cookianum* and *P. tenax*. *Cookianum*, especially the variegated form, is the more elegant plant. This species is readily distinguished from *P. tenax* by its dwarf growth, and by its leaves not splitting at their apices. *P. tenax*, the "New Zealand Flax," was first discovered by Sir Joseph Banks in 1770. Describing it, he says it is the chief economic plant found in New Zealand. With its leaves houses are thatched, lines, cordage, and strings manufactured, and from them slender fibres come, which shine like silk, and are as white as snow. These fibres are then woven into the fine clothing. Seeds were received at Kew in 1771, but, failing to germinate, a fresh supply was obtained in 1789, which proved successful.

### INFLORESCENCE A CORYMBOSE PANICLE.

The yellow and orange coloured flowers of the Day Lilies—*Hemerocallis*—are familiar objects in our herbaceous borders and shrubberies during summer and autumn. They are of easy culture, flourishing in a deep, rich loam, and are propagated by divisions. Plantations should be renewed periodically, as they soon exhaust the soil. Of the eight species, probably the best are *H. Drumortieri*, which grows to a height of 18in; *H. flava*, which grows to a height of from 2ft to 3ft, both having yellow flowers; *H. fulva*, tawny yellow, is distinguished from *flava* by its more robust habit, colour, and especially by its odourless flowers. The orange coloured *H. aurantica* is an autumn flowerer with more erect leaves.

### RACEMOSE.

*Blandfordia* is the only genus in this section, and must be accorded a place under glass to ensure success in its cultivation. Its species are natives of New South Wales, and, unfortunately, like some other Australian plants, are not easy to cultivate. They are usually described as greenhouse bulbous plants, but in fact they are neither, for during their period of growth they require a higher degree of temperature than that of a greenhouse. The so-called bulb is in reality a fibrous mass. A compost of loam and fibrous peat in equal proportions, with the addition of rough silver sand and charcoal suits them admirably. The best species are *B. flammula*, orange red; *aurea*, yellow; and *Cunninghami*, coppery red. The latter species, which attains a height of 3ft, produces in June twelve to twenty pendulous flowers, and was discovered by Allan Cunningham on the Blue Mountains, N.S.W., growing on a stiff clay. It was first flowered by Messrs. Henderson, Wellington Nurseries, St. John's Wood, in 1868. It is allied to *B. flammula*, from which it differs by its narrower perianth, colour, and broader leaves.

The *Tritomas*, or "Flame Flowers," natives of South Africa and Madagascar, are conspicuous objects during late summer and autumn in beds, mixed borders or shrubberies, where their orange scarlet racemes are very effective, and form a striking contrast to most plants. Planted in grass, so that they contrast with *Cortaderia*, or *Gynierum*, the Pampas Grass, they give a bold effect. The majority of the species are easily defined by the measurement of their perianth. Thus, in *T. parvifolia* and *T. breviflora* it is from three or four lines long; six to eight in *T. Pumila*, *T. Leichtlini*, and *T. Macowani*; eight to ten in *T. abyssinica* and *T. sarmentosa*; whilst that of *Burchelli*, *Robperi*,

and *aloides* (syn. *Uvaria*) measures from fifteen to eighteen lines. *T. longicollis* is new; *Tucki* is early. In height they vary from 18in, as in *Burchelli*, to 6ft in some forms of *aloides*.

In a dried specimen of *aloides* var. the raceme and scape measured 7ft. This was sent from South Africa by Mr. Cooper in 1862 to the Kew Herbarium. It is from this species that nearly all our handsome garden varieties are derived. *T. Leichtlini* is a handsome form, with a knob-like, vermilion red and yellow raceme, and it was first flowered in 1881. So far as I have observed, this species is distinct from all the others, by reason of its inflorescence being definite, the terminal flowers opening first. It belongs to the section with exserted anthers. Beginning in July with *T. Macowani* and *T. pauciflora*, we have some of the species in flower till November, the latest being *T. corallina* and *T. sarmentosa*. *T. Tysoni* and *Northiæ* are distinct, being caulescent, and more resembling a *Yucca*.

The three following species are of more recent introduction, and can scarcely be recommended for cultivation in the open border, being only half hardy. *T. rufa*, a stemless form, from Natal, possessing linear, entire leaves, acutely keeled on the back, 1ft to 1½ft long. The peduncle (stalk) is of the same height, bearing a lax raceme of yellow tinged flowers. *T. Tucki* has densely tufted, serrulated leaves, about 2ft long. The peduncle, with several erecto-patent, rudimentary leaves, supports a dense raceme of deflexed, sulphur yellow flowers, which are tinged with crimson prior to expanding. It blossoms in spring. *T. longicollis* is nearly allied to *T. aloides*, but differs by its dwarfer growth, and firmer, bright green leaves, 2ft to 3ft long. The peduncle is shorter than the leaves, and bears a dense, oblong raceme of bright yellow flowers, tinged with orange.

*Funkias* are tuberous rooted, and more generally used as foliage than flowering plants. Some of the variegated varieties are useful greenhouse plants, and with perhaps the exception of *F. subcordata*, all the species make good edging plants for mixed beds or borders. The colour of the flowers ranges from white to lilac and pale blue. A succession of flowers can be obtained from May to October by a selection of some of the species and varieties. Thus in May we have *F. ovata*; in June, *F. Sieboldiana Fortunei*; *subcordata* and *lancifolia* from July to October. Of *F. lancifolia* there are five varieties, *F. l. undulata variegata* being the best for pot culture. *F. tardiflora* is the latest to flower.

(To be continued.)

## Novelties and Rarities.

The nurseries of Messrs. James Veitch and Sons, Limited, at 544, King's Road, Chelsea, are exceptionally well stocked with plants of rare beauty, and for ourselves we can say that never before have we seen the houses so interesting. The bulk of the flowering plants are cultivated at the new Feltham nursery, so that the Chelsea nursery is practically used for show purposes, and the stock here is all immediately saleable. Any lady or gentleman, or gardener, from the country, with an hour to spare, could not do better than make a visit to the Veitchian houses. Twice a week the vans run from Feltham to Chelsea and back, and a warm shed has been provided in which to house a van-load of tender plants as occasion requires. The vans too can be warmed by radiators in cold weather. We name a few separate subjects as under:—

**JASMINUM GRACILLIMUM.**—This is a warm house species, having terminal and lateral clusters of delightfully fragrant white flowers. The plant can be grown with a bushy habit, and is one of the finest subjects for the intermediate house that any gardener could select.

**THE JAVA RHODODENDRONS.**—Go to Chelsea whenever you care to and the hybrid Java-jasminiflorum *Rhododendrons* will be found in flower. For the warm greenhouse they are becoming indispensable, and soon the florist will find them of the greatest assistance in his work of making breast-sprays and button-holes. We would name the following varieties: *President*, a rich red-dish-bronze; *Mrs. Heal*, pure white; *King Edward*, deep yellow, suffused with salmon; *No Plus Ultra*, the best crimson of the set; *Primrose* (of that colour); *Jasminum carminata*, carmine; *Amabilis*, bronzy pink, very sweet; *Rose Perfection*, rose-coloured; *Little Beauty*, small clusters of brilliant coral crimson flowers, grand for sprays; and *Latona*, of a pale delicate primrose colour.

**WINTER-FLOWERING BEGONIAS.**—Practically everybody grows these now, and those who do not are very far behind, but we are sure that few manage them so very successfully as Messrs. Veitch's foremen, Mr. Heal and Mr. Moss, who have them under their charge. The plants are kept stocky and thoroughly clothed with healthy foliage and abundance of flowers. Undoubtedly the brightest of all are *Mrs. Heal* (single) and *Winter Cheer* (double), both of which are scarlet crimson. *Julius*, a double, which we have figured, is a rose-coloured variety, in request by the ladies. *B. Ensign* is another of the best.

\* A paper read before the Kew Gardeners' Guild by Don Id MacGregor.

#### *Lælio-Cattleya Norma superba.*

The parentage of this distinctive and charmingly coloured hybrid are *C. Mossiae* and *Lælia xanthina*. It was shown at the Royal Horticultural Society's meeting on October 13, by Messrs. James Veitch and Sons, Limited, of Chelsea, when an Award of Merit was accorded. The sepals and petals are pale bronzy tea-coloured, very sweet and pretty. The lip is fluted, opening in front, and is delicately coloured light mauve-purple, the throat being yoke-of-yellow hue. Our illustration on the opposite page is from a drawing by Mr. G. Shayler.

#### The Week's Cultural Notes.

Growers of Orchids in the metropolitan area and in the vicinity of other large towns will now have to reckon with the fog, the arch enemy of these plants in our dull sunless winters. Complete immunity from fog is a desideratum much sought by all, but surely by none so earnestly as those who have taken the trouble to bring their Orchid safely through the growing season and then wish to enjoy their lovely blossoms. No amount of care can keep it out of the houses, but its ill-effects may be a little lessened by keeping a comparatively dry atmosphere and avoiding over-watering of the compost. Easily said, of course, but when one day is beautifully bright and clear, and we wake up the next morning with the fog around us, not so easily managed.

Yet, when the plants have been gradually prepared for the winter by hardening and ripening, as described in recent notes, there will not be any need of heavy watering at any time, simply because the plants have within themselves the means of sustenance. The hard, sound, and well-developed pseudo-bulb; the healthy, russetty-looking leaf, are they which will stand the winter vicissitudes; but weak and badly-formed ones, on the other hand, need frequent moistening to keep them from shrivelling.

Perhaps in no other genus is this fact more patent than in *Dendrobium*. Consolidation and rest are as necessary with these plants as they are with a vine or fruit tree. Take the beautiful *D. Devonianum* as an instance. The foliage has now all fallen from the long drooping stems, and these will soon be bristling with the swelling nodes that precede the flowers. Ill-developed plants, on the other hand, will have the foliage still struggling on at the top, to be followed—if water is withheld—by the shrivelling and loss of the upper portions of the stem. Keep the sound plants dry, cool and close up to the light now, and a fine free-flowering return will be the result.

*D. nobile* is rather peculiar in its resting season. Sometimes the stems ripen and flower the ensuing season; at others they remain dormant for a year and flower the next. But in no case should the plant be so severely dried as those of the deciduous section. The Australian set, again, are difficult in this respect. None of them like a long, cold rest, but, on the other hand, they must not be kept moving too freely, for this simply means the loss of flowers in spring. This does, not of course, apply, to the strong-growing *D. speciosum* and its near relation, *D. Hilli*.—H. R. R.

#### Otto Beyrodt's Collection at Marienfelde, Berlin.

Orchids are cultivated here with the best success. In all, there are about seventy-five thousand to eighty-thousand plants, comprising specially, *Cattleya labiata*, 15,000; *C. Trianae*, 3,000; *C. Mossiae*, *C. Mendeli*, *C. gigas*, *C. Gaskelliana*, each 1,000; *Lælia purpurata*, *anceps*, *autumnalis*, &c.; *Odontoglossum crispum* (15,000 plants); also *Odontoglossum grande*, *citrosimum*; *Oncidium Marshallianum*, *O. tigrinum*, *varicosum*, *Rogersi* (3,000 plants); *O. Forbesi* (2,000 plants), *Vanda cerulea* (1,000), *V. Kimballiana*, and *Cypripedium insigne* (4,000); *C. callosum* (2,000), *C. Lawrenceanum* (1,000), and a good stock of the best varieties of various other Orchids.

#### Big Prices for Orchids.

Growers from all parts of the country attended the sale of Orchids at Harefield Hall by Mr. E. Ashworth, the well-known collector, of Wilmslow. There was some spirited bidding. Nearly 300 lots were disposed of. One plant sold for £200, another for fifty guineas, whilst another rare variety was withdrawn at 500 guineas.

#### Orchids from the "Harefield Hall" Collection.

From the catalogue of the two days' sale (November 4 and 5) of duplicate Orchids, the property of Elijah Ashworth, Esq., Harefield Hall, Wilmslow, Cheshire, we take the following paragraphs:—

#### *LÆLIO-CATTLEYA DECIA ALBA.*

(*C. aurea* x *L. Perrini*). This is a most beautiful albino form, flowered from a batch of intensely coloured varieties with Messrs. J. Veitch and Sons; sepals and petals pure white, lip light rosy-pink veined with pure white lines. F.C.C. R.H.S., Nov., 1897.

#### *CATTLEYA MENDELI BELLA.*

A very beautiful variety, sepals and petals blush white; the petals have a pale median line. The upper part of the lip and throat are of a rich golden yellow veined and bordered with paler yellow, while the lower part is of a dark mauve-lilac veined with white. See fig., "Orchid Album," Vol. 5, plate 225. From the "Pickering Lodge" collection.

#### *CATTLEYA WARSCEWICZI VAR. MRS. E. ASHWORTH.*

A very beautiful variety. The flowers open white, but in a few days become a lovely blush white veined with white lines; there is a tinge of yellow on the disc of lip and a small lilac mark in front, A.M. R.H.S., July 27, 1897. From Messrs. J. Cowan and Co.

#### *ODONTOGLOSSUM LUTEO-PURPUREUM VAR. ASHWORTHIANUM.*

(*Hystrix* form.) A charming variety; flowers across sepals 5 in., petals 4½ in., sepals reddish chestnut brown with citron-yellow tips and spots at the base; the petals are creamy-yellow and citron at the tips, three large and a few small red brown spots and purple ray at the base, lip large and fringed, primrose yellow in front and red brown in the middle.

#### *LÆLIA FINCKENIANA.*

This beautiful *Lælia* is supposed to be a natural hybrid between *L. albida* and a white form of *L. anceps*, and bears a fine raceme of five or six of its lovely flowers. It was imported by Messrs. Cowan and sold to the late Mr. C. W. Fincken, of Barnsley, as a natural hybrid, and was named in honour of him when it flowered. It is one of the most distinct natural hybrids yet introduced; the sepals and petals are of the purest white; lip also white, but has a beautiful crimson purple blotch. Mr. Ashworth holds the entire stock, and the two plants offered are all that he will part with. Described "O. R.," Vol. 2, plate 9, F.C.C. R.H.S., December 14, 1893.

## Making a Garden.—II.

(Continued from page 413).

In preparing a plan, always aim at so executing it that a single glance will enable all who know the place to discern what each configuration signifies. For the facilitation of this laudable purpose, coloured inks may be used, and I would certainly advise indelible, which can be procured from Messrs. Winsor and Newton, Rathbone Place, W., in twenty-four different colours, at 6d. and 1s. per bottle. For designating brick and stone work, red will be found appropriate; for trees, shrubs, and grass land, green; and for water, black; or if there is a fondness for colours, blue. If the space between the walls of buildings be shaded, and glass houses left blank, the distinction will be apparent at a glance. The outlines of every part of the plan, whether it be a wall, or the edge of a lake, lawn, or path, should be boldly drawn.

The direction of the swing of every door and gate should be described by a quarter sweep of the compass, shown by dotted lines, and a line running from the pin of the compass to this, perpendicular to the chord of the arc. Let the walls be filled in thickly, the lawns shaded by dotted lines, and woods by short, irregular lines of green, interspersed with black, to give a darker shade. Water may be done in the same way as the lawn, the difference in colour representing the character of each. Timber and ornamental trees may be portrayed by an enlarged and neatly drawn asterisk, and fruit trees by a small and simple drawing of a bush, standard, or pyramid, as the case may be. For wall trees draw a representation of a horizontal or fan-shaped tree projecting from the wall.

Steps may be figured by a series of lines, their number and distance apart corresponding to the number and width of the steps, and the direction of ascent and descent from the main level indicated by an arrow and the word "up" or "down." Hedges may be filled in with a series of dotted lines crossing each other diagonally or perpendicularly. A different way should be found of figuring more or less permanent crops, such as small fruit, Asparagus, Rhubarb, &c. For instance, Strawberries by lines of alternate red and green dots; Raspberries by similarly placed small circles, and so on, there being endless other means of displaying the differences which will readily occur to a thinking mind.

All this will, of course, be tedious, and perhaps monotonous work; but perseverance will enable us to gain in the end, and thus add another bead to the long rosary of proofs which bear out the statement of a Scotch gardener at last August's meeting of the Scottish Horticultural Association in Edinburgh, that "nothing is impossible to the British gardener." Remember the aphorism that "a passionate desire and an unwearied will can perform impossibilities, or what appear to be such to the cold and feeble."

A most useful exercise when the plan is completed is to take a copy of it, which can be very easily done with the aid of tracing and transfer paper, and having drawn the main outlines in faint

lines to mark prominently the location and direction of the water supply and the drains. It may be somewhat difficult to ascertain exactly their whereabouts, but there is usually to be found on every place an old hand who is acquainted with these matters and able to point them out with approximate accuracy, and who is often only too eager to ventilate his knowledge for the edification of his youngers. The direction of the heating apparatus should also be delineated, the employment for the purpose of bold or faint lines representing its subterranean or superterrene portion. In addition to thus enabling us to have in our possession some valuable relics of the place, we shall have gained considerably by the cultivation of a habit of observation, upon which essential attribute depends the success of a gardener.

I have treated at some length of ground plans, but I consider it no less advantageous to take cross sectional plans of the glass structures, showing the relative position of the walks, stagings, hot water pipes, shelves, wires, ventilating gear, &c. Half an inch to the foot is in these cases a useful scale, as it facilitates the drawing, and enables the details to be more clearly and correctly shown.

In the work of measuring we should first line out a level—the path level is usually convenient—and having found this the whole width of the house, the rest is so simple that I need not dwell on it. With the combination of sectional and ground plans we can, by the invocation of a few principles of mensuration, ascertain with an exactitude equivalent to that which the plan bears to the structure the cubical capacity of a house, which is so often required when fumigating; and even by the very act of measuring we necessarily learn by observation many points connected with the construction of a house which would otherwise have escaped our attention.

Returning to the ground plan, when drawn and filled in, the work of casting up the areas commences; and to aid in this I would advise the purchase of a small handbook on mensuration, which may be had for a shilling from Macmillan and Co. It is well-nigh, if not absolutely, impossible to ascertain the exact area of any place having a decidedly irregular boundary; but an approximate figure may be obtained which is sufficiently accurate for all practical purposes. Form within the plan as large a (rectangular) parallelogram, or series of parallelograms, as possible, and find their area by the multiplication of the length by the breadth. Then let the remaining part be divided into squares, oblongs, or triangles, until the whole plan is covered. The area of triangles is found by the multiplication of the base by half the perpendicular height. The area of the whole plan may then be arithmetically added.

Write down neatly in a convenient space the area of the whole plan, the kitchen garden, fruit garden, lawn, lake, &c., also the superficial square feet under glass and under other buildings. Next as to the references. Each separate building and room should be alphabetically marked, and when the entire alphabet has been absorbed in this way, commence it anew with the accompaniment of one of the arabic figures, an index at the bottom indicating the signification of each. Next show the direction of the magnetic needle, and affix a few inches of the scale, with its equivalent, in words beneath. After blacklead marks are rubbed off, and the plan well cleaned, the only thing remaining to be done is to write in clear and bold characters the name of the place, and the name of the artist and the date in smaller but modestly conspicuous hieroglyphics.

Those who take this matter up must expect, as I mentioned at the commencement, to find many circumstantial difficulties which they themselves will best know how to overcome. It may be urged that the head gardener or the squire might object to their taking a plan, but, personally, I think few head gardeners and few gentlemen would be so unreasonable as to deprive a journeyman of such a useful and delightful pastime, provided, of course, he does not make himself obtrusively conspicuous. On the contrary, I think it will be found that the

majority of them will be prepared to assist such praiseworthy efforts on the part of their young men, for it is certain to beget a keen interest in the place, which will, ipso facto, produce a beneficial effect on the daily work.

The young gardener will experience no hindrance in surveying those parts of the garden not overlooked by the hall windows, but those parts falling under these (for him) adverse conditions, he should arrange to do when the family are away, so that his presence in the front may not offend the delicate feeling of the gentry, or lay him open to the charge of possessing an inordinate amount of audacity. In the summer months he can surmount these obstacles by shortening his stay with Morpheus and rising with the sun, thus gaining two or three hours each morning.

Again, his modesty may suggest to him that he is utterly incapable of executing the task, owing to his lack of acquaintance with the sciences of surveying, mensuration, or geometry. Let him not harbour the thought for a moment. Speaking for myself, I had drawn the plan of a garden twelve acres in extent, and with an acre of water on it, before I had seen a book or even read a short essay on land surveying; and it was only when casting up the areas that I speculated in a book on mensuration, although it is indisputable that a slight knowledge of these subjects will greatly simplify the task. I merely mention this personal fact to show that a deep and intricate knowledge is not essential in justifying our making a start, for the work forms a lesson in itself, and our interest once aroused, we will follow up the subject by a happy blending together of theory and practice.

In the act of surveying itself it is a great saving of time and a less strain on our patience to obtain the assistance of a friend, especially when the tape is in use; but this will greatly tax his friendship if he is not interested in the work, and if he is, he will probably expect to share in the honours of success, which it is but natural to suppose the drawer of the plan would prefer to appropriate entirely to himself. So that, all things considered, even though more tedious, it will be in the end more productive of honest pride and unalloyed satisfaction to dispense with any extraneous assistance; and should the drawer be at a loss to know how he is to manipulate his tape, I would suggest that a peg or a brick be used to keep one end in position while he extends it to its length.

The best time for doing all this is undoubtedly during the lighter part of the year, say, from April to October; and although these limits may seem to enclose an all-sufficient space of time, I can assure my readers that if the place they intend to map out be of any large extent, and very irregular, they will find that no time must be lost to complete it within those limits. I have myself been engaged on a plan for seven months, working at it an average of five nights a week, in addition to stopping up often till midnight, rising with the sun, and employing part of the dinner hour; and I wish I could say all my spare time had been so profitably and pleasantly spent.

Young men in lodgings will perhaps be confronted with obstacles which they only can judge whether insuperable; whilst he who enjoys the freedom of a bothy will without doubt be able to prevail on his comrades to allow him sufficient room and licence, and it certainly must be a peculiar bothy where the work could not possibly be done, though I acknowledge

the same cannot by any means be so universally applied to lodgings.

In conclusion, let me strenuously urge all who feel the elements of art within them—and I am led to believe that a love of drawing is an inborn quality in all which needs but developing—to profit by the words I have addressed to them, and prepare for artistic and metrical operations in the spring; and if but one reader can, on reading this essay, say with Milton, "Greatly instructed, I shall hence depart," then shall I have gained some satisfaction in bringing the subject to notice.—WM. ROWLES, Eccles.

**Lælio-Cattleya Norma superba.**

## Retirement of Mr. James McIndoe.

Some weeks ago we announced the retirement of this well-known gardener. This is in consequence of the death of Sir Joseph Pease, Bart., and the sale of Hutton Hall estate. From an interesting biographical notice of Mr. McIndoe, which appeared in a recent issue of "The Gardeners' Chronicle," we take the following:—"As his name shows, he is a native of Scotland, and was born in 1836, his native county being Renfrewshire. His father was a market gardener, and, as a boy, he entered early into what was to be his life's work. His first place on leaving home was in the gardens of Sir John Maxwell of Pollok, the head gardener at that time being a Mr. Campbell. Thence he went to Archerfield, under Mr. Young. These gardens were at that time, and for many years afterwards, when managed by Mr. David

Mr. James McIndoe.

Thompson, considered to be amongst the best in Scotland. The young aspirant to horticultural fame was only about twelve months in his new place before he was made a foreman, being only twenty years of age at the time.

"Later on we find him at Auckland Palace, Durham, as foreman at the age of twenty-one. Thence he went to Bishopthorpe Palace, and Addington Park, Croydon, both in the same position. As will be known to most readers of this journal, these three places were occupied by the then Bishop of Durham, the Archbishop of York, and the Archbishop of Canterbury respectively. In 1863 he was appointed gardener to Coles Child, Esq., Bromley Palace, Kent, which at that time was a place of note in the gardening world, seeing that some hundreds of applicants applied for it when then vacant. A few years afterwards Mr. McIndoe became gardener and farm bailiff to the then Archbishop of York at Bishopthorpe, near York, where he remained till the winter of 1874, when he removed to Hutton. It was here that the chief work of his life was to be done.

"At that time Mr. Joseph Pease was rebuilding the mansion, making new gardens and erecting a splendid lot of new glass houses. The new gardener entered into the spirit of the whole affair with well-directed enthusiasm and, on the whole, very sound judgment. It was quite a treat to meet him at York Gala each year, and hear his vivid but guarded description of the new work done and being done under his management. Very shortly he began bringing object-lessons of his work and care for the judges to look upon and the public to admire. While in no sense wishing to unduly magnify Mr. McIndoe's doing as an exhibitor of fruit, this much may fairly be claimed—that no other gardener has for twenty-five consecutive years, at a first-class show, won so many prizes for fruit as he has done at York. To go further into his record in this respect would be simply to write a catalogue. This much may be added: Mr. McIndoe has often told me that the time he felt most gratified as an exhibitor was in 1897 at Shrewsbury, when he was awarded first prize in the Victoria fruit class for sixty dishes of fruit illustrating the produce of British gardens. Besides the money prize given by the Shrewsbury Committee, the Gold Medal of the Worshipful Company of Fruiterers, London, and two other valuable medals were awarded to this exhibit. As is well known, he was one of the first sixty to whom the Royal Horticultural Society gave the Victoria Medal of Honour later on in the same year. But enough on this head. Mr. McIndoe found time to interest himself in the

social and religious well-being of his neighbours at Hutton. For many years he acted as a churchwarden, and in other ways found an outlet for his judgment and ability. I think that as a body gardeners might fitly do more of this wherever their lot in life is cast.

"Having had the misfortune to lose his wife some three years ago, Mr. McIndoe will make his future home with a married daughter at Dartford, in Kent. He has been appointed to superintend the laying-out and planting a public park for that town. This, with his position as Consulting Horticulturist to the Metropolitan Asylums Board and other opportunities that will occur, will give full scope for his abilities.—Y. G."

## Chrysanthemums.

### English Novelties in America.

A gardening contemporary in New York ("The Florists' Exchange") described the following varieties in a recent issue, which will give growers here an idea of these varieties' behaviour across the Atlantic:—

**MAYNELL** is a glorious flower of the largest size, over 8 in in diameter, with broad, massive, incurving florets, many over an inch in width; colour, a dark, velvety crimson, with old gold reverse. A most attractive flower, indispensable for exhibition.

**MISS MILDRED WARE**, a very lovely flower of a unique colour, reminding one of that of Chas. Davis, but with the size and formation of Mme. Carnot. Undoubtedly a grand variety.

**F. A. COBBOLD**, one of the grandest and easiest growers sent out in years; height, 3 ft, with its very large flower set on top of the finest foliage imaginable; colour, bright rosy pink, very distinct, somewhat resembling Mrs. G. Milcham, when well finished.

**CHELTONI** is the greatest sport we've had in years; never has it been my privilege to see such a beautiful variety. It is the exact counterpart of its parent, Nellie Pockett, with the exception of colour. Usually, sports, more especially from white varieties, are washy and undecided, but in this way we have a most beautiful yellow, quite as deep in colour as Colonel D. Appleton. Those who have not seen Cheltoni can readily imagine a well-grown Nellie Pockett as yellow as Colonel Appleton.

**LELIA FILKINS**, the brightest of all pinks, much brighter than the best Vivian-Morel; an easy doer; habit of the best, with the flower resembling that of Mme. Carnot in formation.

**DONALD McLEOD** is a superb variety in every way. An enormous flower carried on stiff, stout stems, retaining its handsome, overlapping foliage to the bench. Colour, bright fiery red, reverse and edge of petals bright gold. Truly a wonderful combination of colour, easily standing out alone in its class.

**WILLIAM DUCKHAM** undoubtedly will prove the novelty of the season. All who have seen it, without hesitation pronounce it to be the finest introduction in many years. Words can scarcely do it justice. Habit of plant, stem and foliage are all that can be desired. Its massive flowers are carried erect on stiff stems. In colour, it stands alone, being a lovely, warm or glowing satiny pink. Its broad, massive petals, many fully an inch in width, incurving, with the grandest finish possible in a Chrysanthemum. This will undoubtedly be the exhibition and commercial pink when known.

**HARRISON DICK**, a strong, good grower, with large, handsome, glossy foliage, carried well up under the flower, and retained to the bench. A beautiful combination of bronze and yellow, somewhat on the style of Lord Salisbury, but of a stronger constitution. Flowers fully 9 in in diameter.

**HENRY BARNES** is the darkest of all the crimsons; flowers of full exhibition size, reminding one of George W. Childs, only three times as large and very much more vivid in colour.

**BEN WELLS**.—In this we have a monster in size, yet a most beautiful, graceful flower, of a soft flesh colour; one of the most vigorous and easy growers.

**MATTHEW SMITH**, the largest of all Chrysanthemums, the outer petals at this date reach 1 ft across; colour is a combination of yellow and bronze.

**LORD ALVERSTONE** is a very dwarf grower, and undoubtedly the darkest we have; a most fascinating flower. The inner side of petals being so very dark, with the golden reverse showing so conspicuous, make it altogether very attractive.

Described under the head "Early-flowering Varieties," in the same paper, are the seven French varieties, and the following English ones:—

**MRS. A. MCKINLEY** is a fine, big bloom of buff and reddish gold—a bright colour that lights up beautifully; and we think will prove a taking variety.

**ETHEL FITZROY**, a grand, glowing flower like an improved Kate Broomhead, very bright in colour, and round and beautiful in form; a stunning sort for cutting October 15.

MISS OLIVE MILLER, a dainty lavender pink, with broad petals arranged in showy form. About the prettiest pink that we have seen at this date (mid-October). Besides the above they have had excellent blooms of CARRIE, Mr. Wells's early yellow, which came into flower by September 15. The colour and form are fine. It is of medium size and a nice grower, but very bright in colour. Where an early red is needed, GOOCHER'S CRIMSON will be valuable; it is free and a nice grower, has a rounded Dahlia-like flower, and would not "burn" if set on fire.

By November 1 LORD HOPETOUN will be fully finished (it is beautiful to-day, October 19, but not ready to cut). It is larger than last year, and, if anything, the colours are more intense—bright scarlet and pure gold.

S. T. WRIGHT is not quite so far along but promises a large size and deeper shades of both gold and yellow.

## Trees and Shrubs.

### ORNAMENTAL FRUITED KINDS.

The following is from Weathers' "Beautiful Flowering Trees and Shrubs" (Simpkin, London):—Apart from the blossom or foliage, there are many plants that attract more attention during the fruiting stage than at any other period of their cycle of growth. Some kinds are fortunate enough to be considered ornamental in the foliage, flowers, and fruits; some in the flowers and fruit; some in the leaves and fruit; and others in the fruit only. In this paragraph it is unnecessary to refer to either the leaves or the blossoms, as one or the other or both are frequently to be met with. But it may be useful to have a list of the trees and shrubs that are particularly handsome when in fruit, and the following may serve:—

Arbutus Unedo, Aucuba japonica (fœmina), Benthania fragifera, Berberis, Cerasus (Cherry), Clematis, Colutea, Cotoneaster, Crataegus, Daphne Mezereum, Euonymus europæus, Gaultheria, Hippophaë rhamnoides, Hymenanthra crassifolia, Ilex (Holly), Ligustrum vulgare (Privet), Myrtus (Myrtle), Pernettya, Phillyrea, Pyrus, Rosa, Rubus, Sambucus nigra, Skimmia, Symphoricarpos, Vaccinium, Viburnum.

### The Scarlet Oak.

This is the season of the year to be looking out for acorns for sowing, to keep up a stock of good kinds. There are a half dozen or more sorts always called for in larger quantities than others. The Scarlet is one of them. Not only does it make a large and handsome tree, but it also has the brightest foliage of all Oaks in autumn, and because of this it is always called for when an Oak of brilliant fall foliage is required. Its common name Scarlet Oak, is well deserved. A singular feature (observes Mr. Meehan, in the "Florists' Exchange") in regard to the colouring of the foliage in autumn, is that it occurs very late in the season. Many other Oaks, and other trees, colour before it, and while the foliage of the Scarlet is still green. In woods this Oak can be told a great distance away by its bright green foliage, so prominent is it among the changing hues of surrounding leaves. Suddenly, and at last, the change comes, and we have the brilliant scarlet. The acorns of the Scarlet Oak have white flesh,—a means of determining the kind when there is doubt.

## The Palm House at Kew.

Built in 1848—the year in which "our Journal" was established—this huge tropical stove was the first, we believe, in which iron was employed in such structures. It is 362ft long, 100ft wide in the centre, and 66ft high. The wings are 50ft wide and 30ft high. The mileage of hot water pipes we forget. The site had been chosen with a view to giving the best possible effect, and on the sunny south side there is a beautiful geometrical flower garden, a treat to behold in spring, when the bulbous plants present their gorgeous blossoms; and summer does not lessen the variety or the brilliancy of the outlook.

Mr. John C. Willis, in his invaluable book entitled "Flowering Plants and Ferns," supplies the following diagrammatic representation of the different beds in this house, which we think might be given here. The numbers signify the beds, the letters the window benches.

		Door	
	Bench F		Bench B
	13		5
Bench G	12		4 Bench C
S. Door	15 14 11		3 6 7 8 N. Door
	10		2 Bench D
Bench H	9		1
Bench E			Bench A
		Main Door	

Each bed and stage contains certain genera, as, for instance, Pandanales (the Pandus tribe) in 1, 2, 8; Cycadales (Cycas, Zamia, Dion, &c.) in 12 and 13, and elsewhere; Musas in 11; while in the central beds (we write from memory) are some very fine specimens of the following Palms: Cocos nucifera, the Cocoa-nut Palm, which grows on tropical shores, and always with a bent trunk; Sabal umbraculifera, one of the most useful of Palmæ; the Calamus, or Rattan; Phytelphas macrocarpa, whose seeds yield vegetable ivory, and a visit to No. 2 Museum near the alpine garden will convince one of the commercial importance of this remarkable product. One need not mention others; the list is a very wide one, and possibly only a few are generally known. However, should any distant reader visit London, let us suggest Kew as one of the places for visitation, and he or she may be sure that the numerous features of the Royal Gardens there will afford unbounded delight.

A MONSTER CABBAGE.—A Cabbage grown on Penylan Hill, Cardiff (according to the "Western Mail"), measured 5ft across before the outer leaves were removed, and weighed 44½lb. The owner has refused 1½d. per lb. for it.

The Palm House, Royal Gardens, Kew.

### Notes on Some of the Newer Roses.

(Continued from page 424.)

(The Rose Analysis.)

Continuing with the Hybrid Teas, in the order of merit in Mr. Mawley's list of the newer Roses, after Mildred Grant we come rightly to Bessie Brown, which was sent out before 1900, and is now no doubt pretty well known to all exhibitors; and then to Florence Pemberton, which (as I have before noted) was only sent out this year, and could hardly be rightly voted on by amateurs with much confidence, and next to Alice Lindsell. Of this I can say nothing, as I have only seen one bud, which I have at present in my garden on a "run out" budded stock, which I fear will hardly now come to perfection.

Next comes Duchess of Portland, which gained the Gold Medal for Messrs. Dickson at Birmingham in 1900, having been previously shown at the Crystal Palace. At that time it seemed to me, I confess, to be rather too much like Kaiserin Augusta Victoria in the flower, though distinct in wood and foliage. On further acquaintance I have no doubt it is distinct, that is, an expert would readily distinguish between good strong representative blooms of each variety, and would name them correctly. But when grown weakly, as the flowers would often be in the garden of one who is not an exhibitor, it is certain that such a one would find them so much alike to his eyes that it would not be worth his while to have both varieties. This is not meant to detract from its merits or desirability as an exhibition Rose, nor yet to assert that it is not as good or better than the other, but merely that the ordinary gardener who wants especially distinctness in colour would hardly find it worth his while to have both.

The descriptions of the colours of Duchess of Portland and Kaiserin Augusta Victoria are so worded as to imply that the former has more of yellow in it than the latter. I have lately had the opportunity of comparing them both with a new Rose not mentioned in the list, Perle von Godesberg (Schneider or Lambert (?), 1902), which is spoken of as a golden yellow sport from Kaiserin A. Victoria. I had a good bloom of it a short time ago from a strong "run out" shoot, and comparing it with two ordinary autumnal flowers of the other two varieties, it seemed to me that Duchess of Portland was a little (but only a very little) more yellow than Kaiserin Augusta, but rather larger and a little different in shape, and that Perle von Godesberg was a trifle the yellowest of three, but identical with Kaiserin in every other respect; and that, to the ordinary cultivator, if not grown strongly all three varieties would be practically white. I gather, however, from Paul and Son's new catalogue that Perle von Godesberg is "variable in colour, sometimes almost orange, sometimes almost creamy white." As to Duchess of Portland, it is well worth growing by an exhibitor, but I should not give it nearly so high a place; I would put certainly Lady Moyra Beauclerc, and I think also Mamie, above it; in fact, these two would come here in my list of H.T.'s.

Papa Lambert comes next in Mr. Mawley's list (which of course I ought not to call his list, as it is the result of an election), and a splendid Rose it is, as I have seen it in nurserymen's stands, but not in my own garden, either as cut-back or maiden; and this is well confirmed by the election, as it obtained 123 points from nurserymen and only 88 from amateurs. It is of fine robust growth, and I can quite believe it was merely bad fortune that I did not get a single good bloom of it from six or eight standard plants, maiden and cut-back; perhaps it is better as a dwarf.

Of Gladys Harkness, the next on the list, I have one bloom very nearly out, but I can say nothing of it at present except that it certainly is not white, and that is something to say of a H.T. nowadays. Lady Moyra Beauclerc, the next on the list, is a very fine Rose indeed, in my estimation. I won the Silver Medal as best H.P. or H.T. with it at Norwich this year, and exhibited it with success at almost every show. It is very fine indeed in shape, large, and of beautiful colour, which is brightest in the half-developed blooms. I am surprised it did not gain the Gold Medal, which has been given, at times, to far inferior Roses. I have only grown it at present as a standard, and expect that as a dwarf the shoots require to be staked, for though the growth is not weak it is rather slender and the blooms pendulous. It is a Rose which exhibitors cannot afford to be without. Edith D'Ombraïn, the next on the list, has not yet bloomed with me, so I cannot speak of it.

It is worthy of notice how prepotent (as breeders would say) is the strain of Baroness Rothschild (to which both Mabel Morrison and Merveille de Lyon belong): both Her Majesty and Robert Scott, especially the latter, show it plainly. The latter would have been very much improved if it had gained only a little more of the very pointed shape of its parent, Mrs. W. J. Grant; it is of better form than Merveille de Lyon, but much wanting in the elegance of form which is the charm of most of the new H.T.'s. Nevertheless, it is

often good, requiring hot weather and impatient of rain, but very free-flowering and a good autumnal.

Liberty (A. Dickson & Sons, 1900) is another new H.T. which is not unfrequently shown by nurserymen, though amateurs will seldom get it large enough for that purpose. It has also with me not proved a very good grower; otherwise it would have been a splendid Show Rose indeed—magnificent in form, a good laster, and of that splendid bright crimson colour, which is just what we are wanting in H.T.'s. A larger and strong-growing Liberty, if you please, Messrs. Dickson. —W. R. RAILLEM.

(To be continued.)

### Peculiar Plant Names.

Other than the name known to the botanist, a plant or flower bears many a common name, quite sufficient for the ordinary individual. It is, no doubt, better to be able to correctly name a plant, but as so many have such long and unpronounceable designations, it is little wonder the common ones are oftener used, even in the best nurseries and gentlemen's gardens, these being more easily committed to memory.

There are many familiar plants bearing a number of names with which the reader may be unacquainted, because in many instances the names are local. Some of these names are most curious, sufficiently so to make one wonder how they were originated, as there is not always anything in the growth or appearance of the plant or flower to suggest a cause for so naming it. For example, in the Bone-flower, "Apes-on-Horseback," how many would recognise the common double Daisy—*Bellis perennis*? Then the pretty and easily grown *Saxifraga sarmentosa*, so useful for a hanging basket, is known also as Creeping Sailor, Kenilworth Ivy, Mother-o'-Thousands, and the Wandering Jew.

In *Linaria vulgaris* some will recognise the Toadflax, Eggs-and-Bacon, and Buttered Haycocks. Another well-known plant having a number of curious names is *Phalaris arundinacea variegata*. It is to be found in almost every garden; in fact, one can hardly pass a cottage in the country without finding a border of this pretty Grass in front, it grows so profusely. It will force easily, and will be found most useful for cutting when other foliage is scarce. Almost everyone will recognise it under one of the following names, viz.: Ribbon Grass, Sword Grass, Bride's Laces, French Grass, Painted Grass, Lady's Laces, Lady's Garters, Silver Grass, Lady Grass, or Gardener's Garters.

Love-in-a-Mist, Lady-in-the-Bower, Love-in-a-Puzzle, or Devil-in-a-Bush are no doubt suggested by the form of the flower of *Nigella damascena*. One would think His Satanic Majesty had quite a large acquaintance with our garden subjects; judging by the number of plants coupled with his name, the most prominent among them being the Devil's Apple, or Mandrake, a poisonous hardy perennial herb, rarely grown, and having curiously shaped roots. The Devil's Candlestick, or Catmint (*Nepeta Glechoma*) is a hardy herbaceous trailing perennial, suitable for borders, edgings, rockeries, or baskets. Devil's Fig (*Argemone mexicana*), known also as the Mexican Poppy, Thistle Oil Plant, Infernal Fig, Yellow Thistle, and Prickly Poppy; is a very pretty hardy annual bearing large pale yellow flowers, somewhat like Poppies, as some of its names imply. The Devil's Garter (*Convolvulus sepium*) is the common garden Bindweed. It is sometimes recommended for quickly covering trellises, old tree stumps, &c., but for myself I prefer to do without it rather than run the risk of this weed getting out of bounds. Among other names we have Devil Wood, *Osmanthus americanus*; Devil's Bean, *Capparis cynophallophora*; Devil's Bit, *Scabiosa succisa*; Devil's Herb, *Plumbago scandens*; Devil's Milk, *Euphorbia helioscopia*; and Devil's Trumpet, *Datura Stramonium*.

Countryman's Treacle sounds peculiar, a name given to *Ruta graveolens*, the common Rue, used for medicinal purposes. *Viola tricolor*, Heartsease, or Pansy is also named Three-faces-under-a-hood, Kiss Me, Kiss-me-at-the-garden-gate, Kiss-me-ere-I-rise, and Jump-up-and-kiss-me. How a dwarf growing plant like the Pansy came by the latter name is a puzzle.

Lady's Fingers and Foxgloves everyone is acquainted with, but I fail to see what there is in *Digitalis purpurea* to suggest Dead Men's Bells. *Jatropha gossypifolia*, a stove flowering plant, has the suggestive name of Belly-ache Bush, and is also called the Physic Nut. *Pulmonaria officinalis*, a useful little rockery plant having prettily marbled foliage, has a number of peculiar names, of which perhaps the Beggar's Basket is the most curious. Other names for it are the Sea Bugloss, Jerusalem Cowslip, Bedlam Cowslip, and the Virgin Mary's Honeysuckle. *Colchicum autumnale*, or Autumn Crocus, Fog Crocus, Michaelmas Crocus, and Meadow Saffron is also called Naked Ladies, no doubt from the flowers appearing without any foliage.

There are many other quaint and curious names I could mention, but the foregoing should be sufficient, for the present at any rate, to show that a lot of interesting and amusing information concerning the beauties of nature in our gardens may be derived from a study of plants and their various names. —J. W. J., Oswestry.

# NOTES & NOTICES

## Dartmouth Show.

The show was held on Wednesday, November 4. A spirit of competition ruled the neighbourhood. The Mayoress opened the show in the presence of a large number of people.

## The American Parks.

Our contemporary, "American Gardening," which we announced as having changed hands at Mr. Withers' death, is now devoting some pages weekly to news of the American parks and parkmen. This department is being edited by G. A. Parker, of Hartford, Connecticut. He has the knowledge of parks of the country which had come to him by being (for three years) chairman of the Park Census Committee, the advantage of a collection of park reports (over 1,600), and his correspondence with park people (now numbering over 4,400 letters), which fits him for the work. A weekly circular letter is sent round to the leading parks, in order to obtain information.

## Horticulture and Home Industry.

The Horticultural and Home Industrial Society in connection with Messrs. J. S. Fry and Sons, Limited, Bristol, has held its first annual meeting and distribution. Mr. A. M. Fry, president of the society, occupied the chair, and in his opening address said he hoped the annual meeting was the forerunner of many more to be held in connection with the society. The event of the evening having arrived, the distribution of prizes won at the last flower show was made by the president and Mr. C. B. Fry, after which a vote of thanks to the president, vice-presidents, and patrons for their hearty support during the past year was carried with acclamation.

## Cardiff Botanical Garden.

Mr. W. W. Pettigrew, the able parks superintendent of Cardiff, gave an extremely interesting account to the Cardiff Naturalists' Society on the botanical garden in Roath Park. The Naturalists' Society, so far back as 1888, displayed practical interest in the subject of botany, and by their directions the late Mr. A. Pettigrew catalogued and labelled all the trees in the Sophia Gardens. That enterprise, however, proved a failure, because there was not adequate supervision, and Mr. Pettigrew's labours were nullified by mischievous boys, who tore away the labels. When the Roath Park was presented to the town by the late Lord Bute, the Cardiff naturalists again took up the matter, and a deputation waited upon the Cardiff Corporation. Prominent among that deputation was the late Mr. Sonley Johnstone, who in the columns of the "South Wales Echo" had directed attention to Cardiff's need in the matter of facilities for the study of botany. The Naturalists' Society asked the Corporation to set aside a portion of the park as a botanical garden, and the Council, with characteristic readiness, at once granted their petition. Acting upon the advice of the borough engineer, they allocated that portion of the park lying between the Taff Vale Railway and the lake embankment, measuring in all fifteen acres. Under Mr. W. W. Pettigrew's supervision the botanical garden has from unpretentious beginnings grown into probably the finest in Wales. In the first year Mr. Pettigrew managed a collection of some 300 herbaceous plants, and about forty or fifty different species of trees and shrubs. To-day there are between 1,200 and 1,300 different herbaceous plants in the borders, and between 350 and 400 different species of trees and shrubs. The usefulness of the garden has been demonstrated again and again. It supplies the University College with a great amount of their material for the botany class, also the Technical schools and the Board schools, who are now taking up Nature study. Mr. Pettigrew informed his audience that there was plenty of room yet for improvement, and instanced the need of glass structures in which to grow the purely tropical plants and also some of the Alpine orders. The lecture, which was closely followed by the audience, was illustrated by a series of splendid pictures of the plants in the Roath Park botanical garden.

## Chudleigh Show.

Mr. Abraham, Lord Clifford's gardener at Chudleigh, at Chudleigh Chrysanthemum Show last week, won for the third year Mr. St. Maur's cup for the best collection of Japanese cut blooms. Mr. Abraham also won the committee's special prize for the best bloom in the show. A new Violet, "Lady Clifford," was shown by Mr. Abraham.

## United Horticultural Benefit and Provident Society.

The monthly committee meeting of this society was held at the Caledonian Hotel, Adelphi Terrace, Strand, on Monday evening last, Mr. C. H. Curtis in the chair. Three new members were elected, making a total of eighty this year to date. Seven members were reported on the sick fund. The amount of sick pay for the month was £21 12s.

## Royal Meteorological Society.

The next ordinary meeting of the society will be held at the Institution of Civil Engineers, Great George Street, Westminster, S.W., on Wednesday, the 18th inst. at 7.30 p.m. when papers will be read on the following subject:—"The Great Dust-fall of February 21 and 22, 1903, and its Origin." 1. By Hugh Robert Mill, D.Sc., LL.D. 2. By R. G. K. Lempfert, M.A.

## The Ether Treatment.

In order to obtain flowers out of their natural season, it is possible to retard their growth at an early stage by placing the plants in cold, dry houses, and then to force them later under the influence of heat and moisture, or it is possible to stimulate the young buds into premature development by subjecting them to the effects of ether. M. A. Maumené, a strong advocate of the etherisation system, discusses its scientific and practical aspects in the "Revue Scientifique." He maintains that not only do plants develop more quickly after being etherised, but that development is more regular and complete.

## Honour to Mr. Matthew Todd, Edinburgh.

We learn with much pleasure that the members assembled at the meeting of the Scottish Horticultural Association on November 3, on the motion of Mr. A. Mackenzie, Warriston, unanimously elected Mr. M. Todd an honorary life member of the Association for the long and varied services he has rendered to the Association, more especially as having contributed for many years many valuable and artistic exhibits. Mr. Todd occasionally contributes to the *Journal of Horticulture*. He is one of the best known florists in Scotland, and takes a keen interest in all that pertains to the welfare of horticulture in the northern kingdom.

## Suggested Amalgamation of East Kent Gardeners' Societies.

The idea emanating from the Canterbury Gardeners' Society with respect to the amalgamation of the East Kent Gardeners' Societies appears to be receiving attention on all hands, says the "Folkestone Express." Mr. Woodcock, of the Canterbury society, at a meeting gave an able and concise explanation of the amalgamation scheme. He observed that nearly every village had a society, and it was wished to amalgamate all these in East Kent for mutual encouragement and assistance. The first show should be held in Canterbury, and after that the place of the exhibition would be decided by ballot, each society eventually having the show in its own village.

## Scottish Horticultural Association.

Exhibits at the latest meeting were numerous and interesting. Mr. Webster, Gordon Castle, exhibited a nice collection of Apples, Pears, and Plums; a special cultural certificate was awarded. Mr. Waldie, Lamont, showed a vase of very handsome Chrysanthemums. Mr. Fraser, gardener, Kilravock, sent two handsome plants of Soleil d'Octobre Chrysanthemum. Mr. Chapman, St. Leonards, sent small plants of Turnford Hall Begonia, and a sport from it. Mr. Todd, Shandwick Place, Edinburgh, exhibited a beautifully arranged basket of choice Roses from the open grounds of his gardens at Musselburgh; also a beautiful plant of the handsome Cape Gooseberry, Physalis Freneliotti, and a splendid vase of cut decorative Chrysanthemums. Callicarpa purpurea, from Mr. Johnstone, Hay Lodge, was very interesting. Votes of thanks were awarded to the exhibitors.

### Science at Wisley.

The chairman of the Scientific Committee of the Royal Horticultural Society invited suggestions as to what scientific investigations might be undertaken in the new garden at Wisley. Might I suggest the subject of the colouring of Apples, a discussion on which is appearing in the *Journal of Horticulture*? Anyone intent upon absolute daylight on the question of colouring, might proceed in the next dry season to gently and repeatedly spray Apples about August without wetting the ground materially, so as to cool it, while other trees of like varieties might have a good drenching off and on, besides syringing. If a difference becomes apparent in the colouring, the result might be conclusive as to first cause. That the effect of copious artificial waterings in dry seasons acts similarly to rain seems meanwhile a better means for drawing the right inference than any other suggestion as to the causes of colouring in Apples.—H. H. R.

### Grapes at the Chiswick Show.

I think it can scarcely be said that the famous exhibition of fruit at Chiswick made any very great impression on the minds of visitors so far as pertains to the varied Grape classes. Whether the absence of the anticipated standard was due to the dignified environment—the famous vinery—or the unsuitable staging space, remains unsaid. Certainly the narrow side stages were far from being unsuitable to display high-class Grapes at their best, and there were many comments on the generally low standard of quality compared with what has been associated with the R.H.S. and the Crystal Palace shows of the past. The greatest disappointment naturally centred itself in the collections of eighteen bunches and twelve bunches respectively. In the first named, only one competitor came forward, and those who remember so clearly the triumphs of the Elvaston fruits this year, naturally expected great things in reserve. It is, however, only just to say that the merits of individual exhibits are only fairly gauged by competition. “Walk over” exhibits are never interesting to anyone, not even to the “winner,” and it cannot be accounted less than melancholy that so poor an exhibition should await inspection by the patrons of the Society. Only one reason can be assigned to account for it, and that is the money value of the prizes offered. At many provincial exhibitions better prizes are given for smaller exhibits. Such prizes allow of no margin when out-of-pocket expenses are paid.

Then, again, three bunches are too many to expect; two bunches in six varieties would be ample, and would make an exhibition far superior in all-round merit. It could be distinctly seen in the separate classes that the third bunch often fell below the standard of the other two, and this is an experience familiar to every exhibitor. The class provided for twelve bunches, in four varieties, found no entry at all. When one reflects on the fine shows of Grapes seen at the Crystal Palace in past years a feeling of disappointment is inseparable; because what was possible then is, or ought to be, just as much so now.

Grapes that gave evidence of the finest finish from an exhibition point of view were Mrs. Pince, Madresfield Court, and Muscat of Alexandria. The first named were staged in beautiful condition, as also were Madresfield by one or two growers. Muscats were the more numerous, and as varied in their development of colour. The third prize exhibit had the deepest coloured fruit we remember to have seen this year, and hanging on the Vine with the accompanying shade of the leaves it must have appeared intense. The light afforded by the Great Vinery was not an ideal one to present the colours of any Grapes at their best, but it did not hinder the contrast of the golden tints of the many bunches on view. The exhibit under notice would, undoubtedly have found more favour from the judges were not the berries on the upper portion of the bunches shrivelled, through exposure to sun. The Muscat class was the strongest contested one in the show, and brought together some exceptionally fine fruit. Alicantes were less meritorious in bunch, and certainly deficient in colour, compared with some former exhibitions we have seen. That some excellent Grapes were brought together in the class need no emphasis; but the Alicante is a Grape familiarised by massive, jet-black bunches, so that one is excused in the expectancy to find them in their better form at so convenient a season and at so dignified a show. One exhibit did present the characteristic jet-

black berry and the dense bloom of Alicante, but many more were deficient in both.

Of Black Hamburgs, some were good, others very common-place; indeed, critical onlookers whispered loudly that some of the Grapes would scarcely do credit to a local village show. Neither Mrs. Pearson nor Golden Queen make attractive exhibition Grapes, the colour being dull and the berries undersized. Still they possess a quality superior to some other Grapes of more showy character, and are useful in winter.

In the smaller Muscat vinery, the Grapes comprising a portion of the collections of mixed fruit (nine dishes and six dishes) were seen to much better advantage, and from each of the three exhibitors—Messrs. Goodacre, Lock, and Mitchell—came excellent, if not the best, Grapes in the show, of both black and white varieties.—R. A. W.

### Apple, Annie Elizabeth.

Recently you published a letter describing the good fruiting and selling qualities of this variety. Can any of your readers explain why so handsome, solid, and useful an Apple is not included in the generally accepted “best fifteen”? I should be obliged to correspondents for information.—E. D.

### Millipedes and Centipedes.

The little leaflet on the above insects, reproduced in last week's *Journal*, cannot be expected to give more than brief details, but I must remark that some of the centipedes are not deserving of the good character given to the family. It is true, as the structure of the jaws shows, they are not herbivorous, and, above ground or below, employ themselves in hunting other insects; still, fruit has its attractions for them. The chief sinner is *Geophilus longicornus*. This sinuous species takes or makes an opening in a Plum or Apricot, winding its way into the stone, round which it coils itself. Hence it happens that the eater of stone fruit frequently bites a centipede in two; perhaps swallows part unawares. Again, it is very observable that several species are luminous, mostly during spring or autumn. This is particularly the case with *G. subterraneus*, which, on account of the fact, has also received the name of the Electric centipede. Its light, however, does not seem to be electrical, but rather of the nature of phosphorescence. It is observable along the joints of the body, and it is, unlike the glowworm in this respect, that the light is deposited along its path as it crawls, and may be seen two or three feet from the insect, though it soon fades. No doubt it answers some purpose.—ENTOMOLOGIST.

### The Colouring of Apples.

The somewhat diffuse length of the contributions to your columns on this subject, do not appear to traverse my more concise, and yet broader, hypothesis on page 380. The former do not advance beyond the analytical point of view, while I reach the bedrock itself by the synthetical process. The first cause of the cooling of summer conditions is usually rain. The soil is cooled, and nitrification (and with it expansion of fruit) is retarded. We all know of the exuberant growth of tropical vegetation, which is, of course, the consequence of the higher state of nitrification of the soil from the sun's greater intensity. The reverse action follows from the cooling of the ground in our own land. The incidence of cooling of the air, and rough winds springing up, are phenomena that accompany the advent of rainy weather. Nitrification is therefore probably the most essential one in the problem of fruit colouring. It may be tacitly admitted that the chemical process set up by the sun's heat acting directly on the fruit, independently of heat developing in the soil, is probably the element which induces colouring (of course, on the sunny side of the fruit), and takes place when fruit expansion is retarded by cooler conditions, and energy is liberated to another purpose. Mr. Willis's citation on page 417 of foreign authorities may cover the ground fairly well by their reference to the beautiful carmine-red in the upper cells, the element which ensures colouring. The process referred to by me, “the fall of temperature,” is here also emphasised. Frosty conditions, of course, usually only follow fruit gathering in these parts. In relation to the experiments also referred to by Mr. Willis, whether various manures affect the colouring, undertaken by Mr. Hall, the range of such experiments, locally practised, would have only limited application. The mineral substances in the soil would have more effect on colouring than mere fertilisers. The very various characters present in fruit from different localities is probably chiefly to be accounted for by minerals of various kinds in the soil.

Apples from warmer climes than ours, referred to by “Provincial,” their relatively high colouring is, of course, a response

to the yet fuller action of our great orb on the surface of the fruit itself in those regions; the expression of the action and conversion into yet richer tints than with us being its equivalent, when in due time rain follows. The "cold snap," of course, affects the soil that is in a high state of nitrification, but it usually comes about by rainy weather setting in, in the first instance. It is not "in spite of the rain," as "Sunny South" opines, that fruits colour, but from its cooling influence.—H. H. RASCHEN, Sidcup.

### Large Potatoes.

Having seen a few different accounts of large Potatoes, I have been led to pen these few remarks of my experience with the Potato Up-to-Date. This season I planted a few tubers which have yielded the heaviest Potatoes I have ever seen. I lifted one tuber making the remarkable weight of 2lbs 15½ozs, and a very good shaped tuber it was. I also lifted one root with six fine, even tubers, fit for any exhibition table, the six weighing 7lbs. There were also three smaller tubers on the same root, making the total weight of 7lbs 10½ozs. There were a good many of the tubers weighing 1½lbs, and not one diseased tuber in the whole crop. Is there any record of a heavier Potato than the above?—W. B., Kent.

### Scottish Horticultural Association.

(Queen Alexandra Chrysanthemum Prize, 1903.)

With your kind permission, I would like to say that the "Queen Alexandra Prize" is not out of place. Does our friend, "Interested" (page 401), think that the gardeners in a town can compete against gardeners from the country? I say no! the town gardener never has a look in. I am sure that it was a great credit to the Council of the Scottish Horticultural Association to think of giving the gardeners in Edinburgh and Leith a class to themselves. I can inform "Interested" that there are as good growers of Chrysanthemums in Edinburgh and Leith, at the present time, as in any part of the United Kingdom, and I can assure our friend "Interested" that there will be a big competition for the "Queen Alexandra Prize." Following up the remark made by another friend, "Anglo-Scot," page 416, I would say that if a vote was taken at the Scottish Horticultural Association's meeting in Edinburgh, I am sure there would be a great majority vote in favour of the "Queen Alexandra Prize." It is, I may say, the Edinburgh and Leith gardeners that are the mainspring of the Association. They are nearly all town gardeners that attend the meetings of the Association; and I think that they (the town gardeners) deserve a class to themselves for their trouble. If our friends ("Interested" and "Anglo-Scot") have the opportunity of visiting the Chrysanthemum Show in Edinburgh, they will see the Edinburgh and Leith gardeners are second to none.—W. W. S.

[We have no wish to take sides in this controversy, but we would observe that if the Edinburgh and Leith growers are "second to none," why is there any need to shut off cultivators from the other parts of Scotland or England? To win in open competition would surely be the greater honour.—Ed.]

### Farmyard Manure.

(Continued from p. 423.)

#### Treatment of Dung in the Homestead.

Attention should be given to the prevention of the escape of liquids, for these hold the larger and much more valuable part of the plant food. These may drain into the ground if the floor of the yard or dung-heap be porous, therefore the surface on which the mass rests must be water-tight. More frequently, perhaps, they are allowed to run away in a surface stream, and unless this can be led on to a meadow or other field, the loss may be very serious. The floor of the dungsteads should not only be impervious to the passage of liquids, but it should have a distinct slope backwards, so that the front is 2ft or 3ft higher than the back. No doubt concrete is the most satisfactory form of floor, but no great waste, if any, will take place through a foot of well-beaten clay overlaid by rubble.

Over-heating is productive of loss in various directions. The heat that is always more or less associated with a mass of dung shows that actual burning is going on, and, in the process, nitrogen escapes into the air. The weight of organic matter is also reduced, and as part of the value of farmyard manure is due to its being a bulky organic substance, it is undesirable to have this substance largely consumed in the dung-heap. During a winter's storage the loss of weight will usually be

about 20 to 30 per cent., but it may be double this, and when the loss is excessive the capacity of the mass to suck up and retain liquids is correspondingly reduced. Moderate decomposition cannot be avoided, and is not to be regretted, for if no loss has occurred by drainage, and but little by the air, the smaller mass will contain practically all the original plant food, and this, too, in a more portable and convenient form. If, for instance, 5 tons have shrunk to 4 tons, the value of the latter quantity should be as great as the former, so that if 5 tons of fresh dung are worth 15s.—i.e. 3s. per ton—4 tons of matured dung will still be worth 15s.—i.e., 3s. 9d. per ton.

Over-heating is avoided by keeping the mass well compressed; and this is secured by the treading of animals—as in yards, courts, or boxes—or by wheeling each barrow-load or cart-load over what was there before, or, by loading on soil or rotten turf. The mass should also be kept saturated with moisture, and this is best secured by preventing the escape of liquids. With dung of a very dry character (horse manure), especially in a covered dungstead, it may be desirable to add water, but only if there is no chance of superfluous moisture escaping by drainage.

If manure is stored in a compact, deep dungstead, with a properly constructed floor, and if care be taken to prevent its getting more water than falls directly on it in the form of rain or snow, there is no need to cover it in. Loss by excessive washing can be better prevented by other means than by erecting a roof over the mass. It is obvious that the advantages of a covered dung-heap will be greatest in a district of heavy rainfall, but in any case it is doubtful if it will pay to provide a roof for the dungstead unless it can be also used as a cattle-shed.

Many farmers prevent loss due to escaping liquids by leading these directly on to the land, or by conducting them to a tank which is periodically emptied into a liquid manure cart and distributed over the land. If the character and lie of the fields suit such methods of treatment, they are in every way commendable, but local circumstances often make it difficult or impossible to carry them out.

Over-heating and excessive loss of weight are obviated by compression and saturation, simply because the dung-heap under these conditions contains comparatively little air, and air is a necessity of fermentation and decomposition.

To bring raw manure into a rotten condition, farmers often turn it over once or twice, the result of which is that air permeates the whole mass, and great heat is developed, with corresponding loss of weight. No doubt there are circumstances where such treatment is expedient; but, considering the cost of labour and the loss of organic matter, and, to some extent, of nitrogen, it is probable that the process is often performed when it would be better avoided. The familiar example of the slow combustion of a "backed" or "banked" fire of coals is strictly comparable with what takes place in a well-packed mass of dung, while in both cases rapid combustion, with concurrent disappearance of solid material, will follow vigorous stirring.

Equality of composition throughout the whole mass should be secured as far as possible, or otherwise the best results both in the heap and on the crop will not be secured. The dung from the stable, cow byre, feeding byre, store byre, and piggeries has, in each case, its own characteristics, and the mingling of all will produce, on the whole, better material than having the horse dung in one part, the cattle dung in another, and the pig dung in a third. The wet, inert, cold character of byre dung will add moisture to the stable dung and prevent its being over-heated ("fire-fanged" it is sometimes called), while the rich manure from the feeding boxes will improve the quality of the dung of the store cattle.

#### Conservation Agents.

From time to time attention has been directed to the prevention of loss in manure heaps through adding gypsum, super-phosphate of lime, kainit, or sulphuric acid. On the whole, it cannot be said that any of these has much effect. The admixture of soil with dung, however, is always to be recommended, provided such material can be obtained at little expense for labour. To give the best results, the soil so employed must be of a loamy character, and, if possible, rich in organic matter. Its effects are to fix ammonia, to encourage the formation of nitrates, to assist in consolidating the mass, and to suck up and retain liquids. Needless to say, soil so employed must not contain the seeds of troublesome weeds or the germs of plant diseases, such as finger-and-toe. Moss litter or peat is also an excellent fixer of ammonia and absorbent of liquids, and, if for nothing else than to improve the manure heap, it is a good plan to have a little in use for some of the live stock. Such peaty manure, unless it is being used in a yard, should daily be spread in the dungstead, and the quality of the resulting mass will be thereby appreciably improved.

(To be concluded.)

Crotons show highest colour when pot-bound, and exposure to the cool nights of October will accentuate it and make them all right for Christmas trade. As a rule anything that checks growth heightens colour.

### Apple Gascoigne's Scarlet Seedling.

This is one of the handsomest of dessert Apples, the fruits from pot trees assuming, under favourable culture, the richest crimson colour. Messrs. Bunyard and Co., Limited, staged exceedingly fine pot-grown trees of the variety at Chiswick this year, and the colour was quite extraordinary. We figure four fruits (reduced) on the opposite page, from a photograph by Mr. Tyler, of Halstead, Essex. The fruits are large, and possess an agreeable flavour. It is advised to prune the tree lightly. Its cropping qualities are well known, the tree being a healthy grower, especially on the Paradise stock. It is both used for dessert and for cooking (mostly for cooking), and is fit from October till January. Though best known by the name we here use, it is occasionally referred to as Glory of England.

### Newer Varieties of Fruit in Banffshire.

The monthly meeting of the Scottish Horticultural Association was held in Dowell's Rooms on Tuesday, November 3. A very large number of members were present. A dozen new life members and about fifty new ordinary members were elected. A paper was read by the secretary entitled "Notes on Newer Varieties of Fruits." The paper was a very interesting and instructive one, and passed in rapid review the more recently introduced fruits. Though in a far northern climate, proximity to the sea and shelter from winds render Gordon Castle a fairly favourable place for outdoor fruits. Amongst Apples Mr. Webster (the essayist) specially mentioned as worthy of note Newton Wonder, Bailie Nelson, Early Victoria, Rivers' Early Codlin, Foster's Seedling (an improvement on Cellini), Allington Pippin (extra choice), Christmas Pearmain, Wealthy (not quite a success in Scotland), and James Grieve (a great acquisition). Pears and Plums were also passed in review. Of Pears not many of recent introduction succeeded better with him than old standard sorts. Of Plums he specially mentioned Burbeck, Golden Transparent, Monarch, Grand Duke, and Archduke. Among Cherries, St. Margaret's was mentioned as a very first-rate recent introduction. Among Gooseberries Langley Beauty and Langley Gage were specially praised. A most interesting discussion followed the reading of the paper, and much interesting information was elicited from amongst others. Mr. Whytock (Dalkeith Park), Mr. D. W. Thomson, Mr. A. Mackenzie, Mr. Comfort, and the chairman, Mr. McHattie. A very hearty vote of thanks was awarded to Mr. Webster.

### The 1903 Vintage.

On the Continent, as in England, every extreme of weather has been experienced this season. Not only the exceptionally late frost (that of April 18 was alone estimated to have reduced the value of the possible Grape crop in France by something like twenty millions sterling), but hailstorms, excessive rains, and the resultant mildew have played havoc with the Vines in almost every district. Added to this, spasmodic heats during the early summer—notably in Italy—have made up a sum of misfortunes which it is confidently asserted will, in the wine-production of the four great Vine-growing countries of Europe—France, Spain, Portugal, and Italy—result in a deficit of no less than forty million hectolitres, or say 880 million gallons, as compared with the yield of an average year. As regards quality, it is true that some twenty days of sunshine, coming at a time when the Grapes in ordinary years would have been in the fermenting vats, have wrought wonders in the vineyards, so that wine-growers have had the satisfaction of seeing a flood of continuous October sunshine, increasing the degree of saccharine in the fruit day by day, and, where the Grapes have escaped any damage from the excessive moisture of the previous months, there is still a prospect of the wines being of good merchantable, if not commanding, quality. In the matter of quantity, this year's vintage must be a great disappointment, with scarcely an exception, in every country of Europe, while, as regards quality, except in the most favoured localities, no very great hopes can be entertained of a production of wines of the highest class.—W. AND A. GILBEY.

A PROFITABLE APPLE TREE.—Mr. Blow, of Little Hale, near Sleaford, Lincolnshire, has an Apple tree that produced him this season twenty stones of Apples, which he sold at 4s. per stone—£4 in all.

## Societies.

### National Chrysanthemum, Crystal Palace, November 10, 11 & 12.

SUMMARY.—The first day (Tuesday) was delightful, and there was a good attendance. The exhibition was smaller than usual, and the flowers generally were less meritorious. At the same time it was a very interesting show. Mr. N. Davis won in Class 1; Messrs. C. Beckett and R. Kenyon stood thus in the great vase class; Mr. Hunt alone showed in Class 3; Mr. Higgs led for the thirty-six incurveds; and Mr. Mease was again foremost for the forty-eight Japs. The leading prizewinners in Division I. were the above and Messrs. Jefferies and Bastin. Mr. Vallis was absent this year.

After twenty-six years at the Royal Aquarium, Westminster, the N.C.S. exhibitions have had to be moved elsewhere. The only fitting place was the Crystal Palace, which unfortunately is not central, and at this season of the year is not so comfortable to visit as the Aquarium was. The light and the space for staging is very much better, however; and there were some nursery firms who refused to bring plants within the Aquarium who are represented at the C. P. on this occasion. The arrangements with the Crystal Palace Company are for the present year only.

We desire to mention the good services of Mr. Geo. Caselton, of the C. P. gardens, and his staff in assisting Mr. R. Dean in making the arrangements at this show. The judges were:—For plants and groups, Mr. J. F. McLeod and Mr. A. Turner; cut blooms, Mr. J. Fulford, Mr. C. Orchard, Mr. G. Inglefield, and Mr. W. Robinson; decorations, Mr. E. Hill and Mr. T. Challis; fruit and vegetables, Mr. W. Allen and Mr. G. Woodward. The following acted as stewards: Messrs. J. McKercher, D. Ingamells, J. T. Windy, A. J. Foster, and E. F. Hawes.

Donors of special prizes were as follows: Messrs. G. H. Richards (XL All specialities); Mackenzie and Moncur, Limited, W. J. Godfrey, H. J. Jones, Charles E. Shea, Percy Waterer, and Webb and Sons.

Except for one or two classes, the first thirty were open to all, trade included. The total number of classes in the schedule was seventy-seven, divided thus: For cut blooms (in the three divisions), forty-three; for plants, including a group, five; for decorations, nine; for fruit, six; for vegetables, fourteen.

At the shows of the society this year new regulations have come into force, entailing entrance fees, these in a number of cases being as much as 10s. per class.

#### CLASS I.—FLORAL DISPLAY OF CHRYSANTHEMUMS.

Plants, cut blooms, and cut foliage were here desired, and the space allotted to each competitor was 300 superficial feet. £10 10s. was the first prize, and 10s. entry fee was necessary. To ensure the collections being judged in harmony with general recognised principles, a maximum of fifteen points is set as a standard, and are allotted as follows:—

	Points
A. For quality of Chrysanthemum blooms, whatever may be the type employed ... ..	6
B. For quality of the foliage plants, as shown by their elegance, colour and adaptability ... ..	3
C. For attractive arrangement ... ..	6

The schedule had the following note:—"It is particularly desired that exhibitors shall break away as far as possible from the ordinary formal arrangement of groups of Chrysanthemums for exhibition purposes."

Mr. Norman Davis, Framfield, Sussex, was an easy first, the groups did not need a second glance; and Messrs. J. Peed and Son, Roupell Park Nurseries, West Norwood, S.E., came second. The latter set up a conical, even mass, and certainly had made no attempt to comply with the schedule Note which we print above. Mr. Davis's group was a model of excellence. Round the base were purple Mahonia, and throughout the group were standard Crotons, and tall vases filled with his Mrs. Mease and Madame Carnot Chrysanthemums amongst others. In the body of the group (it was mostly below the eye) were masses of blossoms, with Kentias, Eulalia, Ferns, and Asparagus.

#### GREAT VASE CLASS.

Class 2, for twelve vases of Japanese blooms, distinct, five blooms of each, for the first prize of ten guineas and Sir E. Saunders' Memorial gold medal, brought out a couple of excellent displays. Mr. C. Beckett, gardener to Sir W. G. Pearce, Bart., Chilton Lodge, Hungerford, led off with large but not very refined flowers. Reading from left to right they were: Gen. Hutton, Mrs. J. Bryant, Mrs. W. Mease, Mrs. F. W. Vallis, F. S. Vallis, Mrs. Barkley, Mrs. A. R. Knight, W. R. Church (good), Madame C. Naglemackers, J. R. Upton, Geo. Penford, and Madame Paolo Radaelli. The latter two were good. Mr. R. Kenyon, gardener to J. R. Twentymen, Esq., Monkham, Woodford Green, was a fair second, his best being Bessie Godfrey, F. S. Vallis, Mr. T. Carrington, and W. R. Church. Only two competed.

## NATIONAL COMPETITION OF CHRYSANTHEMUM AND HORTICULTURAL SOCIETIES.

Class 3, for forty-eight blooms, 24 each of incurveds and Japs, the entry to be made in the name of a society, brought only one display, and this came from that champion grower, Mr. G. Hunt, of Ashted Park, Epsom. He staged for the Epsom and District. All the flowers came from this one cultivator, and they were remarkably fine. They deserve a fuller notice than we have space to give, but the newer and best were: Florence Penford, one of the most beautiful and distinct Japs of recent years; it is a J.-i., reddish-bronze on the inner surface and rosy-tea on the reverse. Godfrey's King was good; also F. S. Vallis, Madame Paolo Radaelli, Madame Herwege, and Bessie Godfrey. The incurveds were clean and large, though not so even as we have seen in other years. The finest were C. H. Curtis, Mrs. F. Judson, Mrs. C. Crooks, Duchess of Fife, Hanwell Glory, Ada Owen, and Dome d'Or.

## HOLMES' MEMORIAL CHALLENGE CUP.

Two Cups are offered by means of private subscriptions, one for thirty-six incurveds and the other for forty-eight Japs. Mr.

Pride, rose-crimson, bronze reverse, rather flat, and rough at the base; F. S. Vallis, a model bloom, smooth, large, rounded, very clear yellow. Other good flowers were Madame P. Radaelli, large, and good in all respects; Mrs. E. Thirkell, small, but of good colour; Mme. Carnot; Capt. Percy Scott, moderate size, flattish surface, fair depth, very rich bright yellow; Countess of Arran, a passable flower, but the colour here was a washy mauve-purple; Mr. T. Carrington, Lord Ludlow, and E. Molyneux. The second award was captured by Mr. R. Kenyon, with bright blooms, but the general quality was decidedly lower than that in Mr. Mease's set. His best were Godfrey's King, Matthew Smith, General Hutton, Mrs. A. McKinley (just certificated by the American N.C.S.), a firm built, bronzy-yellow flower; Chas. Longley, rich purple amaranth, a beautiful and telling flower; Donald McLeod, a sweet rich yellow with purplish streaked tips; Bessie Godfrey, Godfrey's Pride, E. Molyneux, and Nellie Pockett. Mr. Jefferies, Moor Hall, Harlow, Essex, staged as his best the following: Mrs. E. Hummell (well thought of in U.S.A.); Bessie Godfrey, Sensation, Mrs. Mease, Mrs. F. W. Vallis, Mons. Chenon de Léché, Elsie Fulton, Maynell, Mme. Von André, Ethel Fitzroy, and C. Longley. The crop of the last year's

Apple, Gascoigne's Scarlet Seedling.

Higgs, gardener to J. B. Hankey, Esq., Fetcham Park, was leader in the class for incurveds, with a well-dressed, highly creditable collection. The blooms were shown all even and pure in colour. The more select were C. Blick, large, but good shape, and beautifully tinted; Miss A. Dighton, a very sweet yellow—a gem; Mme. Lucie Faure, milk white, good; Mrs. F. Judson, large, pure white; C. H. Curtis, intense yellow, high centre; and Robt. Petfield, a lilac-purple of round form. Mr. W. Mease, gardener to A. Tate, Esq., Downside, Leatherhead, was a decidedly inferior second; Mr. G. Hunt came third; and Mr. W. L. Bastin, gardener to Sir A. Henderson, Bart., M.P., Buscot Park, Faringdon, was fourth.

Mr. Mease led for the four dozen Japs (c. 5), with heavy, richly coloured blooms. The stand included Miss Mildred Ware, good colour; Nellie Pockett, immense size and perfect form, colour milky white, with polished surface—a fine flower altogether; Phyllis, bad form, but fine golden colour; Alfriston, a rich crimson (Is it an improved Molyneux?); Bessie Godfrey, good form; Sir H. Kitchener, moderate size, good form; Guy Hamilton, a very large and graceful bloom; Henry Stowe, firm, round, incurving; Duchess of Sutherland, rich colour, but loose; Matthew Smith, a fair flower; Mr. F. W. Vallis, rich crimson and old gold, high centre, a distinct and interesting flower; Godfrey's

novelties was great, and the flowers we name were good, though moderate in size. There were but three entries, each excellent for the season.

SIX VASES INCURVED BLOOMS were asked for in class 6. The lead was with Mr. W. Higgs, who staged large flowers of even form and good finish. The first was a novelty, Mrs. Barnard Hankey (Wells), a large, rounded deep flower, purplish crimson on surface, and bronzy, purple-shaded on the reverse. He had also Nellie Southam, C. H. Curtis, Duchess of Fife, Hanwell Glory, and Lady Isobel (immense deep blooms). This was really a splendid exhibit, and one to be proud of. Mr. G. Hunt, of Epsom, was second; and Mr. W. L. Bastin, third.

GODFREY'S INTRODUCTIONS.—In class 7, for thirty blooms of ten varieties, shown in vases, three blooms each, not necessarily the same sorts, all to be Exmouth introductions since 1900, there were two entries. Mr. R. Kenyon was first, and Mr. A. Jefferies second. It only required a glance to see how rich the colours of these Exmouth introductions are, golds and crimsons run all through. The following were the finest blooms in the first set: H. E. Hayman, Bessie Godfrey, Godfrey's King (small, but rich), Exmouth Rival (smooth broad petals, deep glowing crimson), and Queen Alexandra. In Mr. Jefferies set were Mrs. John Balfour,

rose-lilac and white; Queen Alexandra (very good in colour), Bessie Godfrey (perfect), and Exmouth Crimson.

ENGLISH-RAISED SEEDLINGS NOT YET IN COMMERCE.—For Mr. H. J. Jones' prizes (six varieties, three blooms of each, on boards, in class 8), Mr. H. Perkins, gardener to the Rt. Hon. W. F. D. Smith, M.P., Greenlands, Henley-on-Thames, was the only entrant with the following: Mrs. J. Wheeler Bennett, a beautiful rich yellow of round form and moderate size, not by any means stiff. Mrs. Winfield, somewhat of the Matthew Smith type, flattish at first, opening to a rounded dome, with soft canary yellow colour; the base florets are purplish. Winifred Countess of Arran, a massive blue purple flower; the Hon. Mrs. Seymour, a deep rounded flower, rich bronzy-yellow with reddish shading, somewhat of the Lord Ludlow type; Herbert Winfield, small, with drooping broad bronzy-crimson florets; and lastly, the Hon. Mrs. Codrington, a sulphury yellow, lax and round. None of them are "extra special."

## Division II.

### PLANTS.

CLASS 9.—There has been a considerable falling-off in this division during recent years, and as the Society now only offers four classes for plants, it is evident this section is still waning. There was only one entry for six bush plants, the prize going to Mr. H. Smith, gardener to Colonel Bowles, M.P., Forty Hill, Enfield, who had beautiful specimens of John Shrimpton, Phœbus, and Nellie Pockett. The single specimen came from the same exhibitor with a nice plant of Amy Ensoll. (No further exhibits.)

### CUT BLOOMS.

CLASS 13.—The President's Prize was offered in a popular class, that for 24 Japs, a class in which the President, in his exhibiting days, was most successful. On this occasion there were six contestants in the field, Mr. A. Jefferies winning the coveted award. His varieties were Mdme. Carnot, Mrs. Barkley, J. R. Upton, Mdme. Herwege, Countess of Arran, Lord Ludlow, Mdme. P. Radaelli, Bessie Godfrey, W. R. Church, Mrs. J. J. Thorneycroft, Marquise V. Venosta, E. Molyneux (good), Miss Elsie Fulton, Godfrey's Pride, General Hutton, Mrs. J. Bryant, Ethel Fitzroy, Miss Alice Byron (fine), Mons. Chenon de Léché, Nellie Pockett, Sensation, Mrs. E. Hummell, Ben Wells, and Calvat's Sun. Mr. James Preeee, gardener to Miss Willmott, Warley Place, Brentwood, was a good second, having Henry Perkins, Lady M. Conyers, Bessie Godfrey, W. Duckham, W. R. Church, and W. H. Whitehouse for his best. Mr. J. Lock, gardener to the Hon. Justice Swinfen-Eady, Weybridge, was a good third.

CLASS 14.—The competition for twelve Japs is always most keenly contested, and here there were nine competitors. Mr. G. Hewitt, gardener to C. E. Green, Esq., Theydon Grove, Epping, was an easy first, his blooms being Rev. W. Wilks, of grand colour; Matthew Smith, Mrs. G. Mileham, Kimberley, Florence Molyneux, Marquise V. Venosta, Lord Ludlow, Mrs. J. Bryant, Sensation, Bessie Godfrey, Mrs. H. Weeks, and Mary Inglis. Mr. George Halsey followed with a good level board, his best varieties being Mrs. G. Mileham, W. R. Church, Mrs. Mease, G. J. Warren, Australie, and Le Grand Dragon; while Mr. H. Smith came out a good third.

CLASS 15 was for a vase of white Japs, six blooms in one variety. There were three entries, and Mr. W. G. Prudden-Clark, York Road, Hitchin, was placed first with a fine exhibit of The Princess. Mr. G. A. King, gardener to K. Jones, Esq., Knightons, East Finchley, was second with a fair exhibit of Nellie Pockett; while Mr. George Wilson, gardener to E. T. Powell, Esq., Brondesbury Park, brought up the rear with Guy Hamilton.

CLASS 16.—A similar class was provided for yellow flowers, and there were five entries. Mr. A. Jefferies, gardener to J. Balfour, Esq., Moor Hall, Harlow, was placed first with a glorious vase of J. R. Upton; Mr. W. Mease followed with F. S. Vallis in grand form; the third prize going to Mr. G. Halsey, gardener to J. Lyon, Esq., Riddings Court, Caterham Valley, with Mrs. Mease. Mr. G. A. King was fourth with Le Grand Dragon.

CLASS 17.—The vase of six, of any colour except white or yellow, brought out a satisfactory entry of eight. Mr. W. G. Prudden-Clark was placed first with Mrs. G. Mileham, Mr. G. Halsey following with the same variety; and Mr. A. Jefferies was third with E. Molyneux (of grand colour). Mr. W. Barrell, gardener to Mrs. R. Thornton, The Hoo, Sydenham Hill, fourth, with Miss Mildred Ware.

CLASS 18.—The class for twelve distinct incurveds was supported by five exhibitors. The first prize was awarded to Mr. W. L. Bastin, who staged Mrs. H. J. Jones, Hanwell Glory, J. Lyne, Duchess of Fife, Chas. H. Curtis, J. Agate, Ialene, Countess of Warwick, Edith Hughes, Lady Isobel, W. Neville, and Nellie Southam. Mr. C. Lane was second, and Mr. R. J. Jolliffe third.

CLASS 19.—For six incurveds, one variety only, there were

five entries, the first prize being well won by Mr. C. Lane, gardener to E. H. Coles, Esq., Burntwood, Caterham, who staged Chas. H. Curtis in good form. The second prize had neither name nor exhibitor; and the third prize fell to Mr. R. J. Jolliffe, Bonchurch, who staged Lady Isobel. [Our representative was unable to discover the location of the six market varieties asked in class 20; probably there was no entry.—Ed.]

Large-flowered reflexed, class 21. How sadly have the reflexed varieties fallen in the hands of the N.C.S.!! Only one class was provided for the section for twelve blooms, not less than nine varieties. This was represented by two exhibitors. Mr. Chas. Brown, gardener to R. Henty, Esq., Langley House, Abbots Langley, was first, his best blooms being Cullingfordi, White Christine, and Dr. Sharpe. Mr. J. Barrance, gardener to G. W. Taylor, Esq., Hadley Bourne, Barnet, came second, with smaller though beautifully fresh flowers. Class 22 was not seen. Class 23 was for twelve large-flowered Anemone blooms, Japanese excluded. Mr. J. Barrance was awarded first prize, and Mr. Chas. Brown came second. Neither exhibit was worthy of a prize at a National Society's Show.

Large-flowered Japanese Anemones; class 24. A class was provided for these, though, sad to relate, there were only three entries. Mr. A. C. Horton, gardener to H. H. Platten, Esq., Harwood Hall, Upminster, was placed first with a fair display—and a bad method of naming the flowers! Mr. C. Brown following with smaller blooms, while Mr. J. Barrance was third.

Pompons, class 25. The class for nine bunches of pompons, six blooms each, in vases, was an innovation, and justified the alteration from the orthodox board. There were but three entries, Mr. Chas. Brown being a good first. His varieties were Wm. Westlake, Prince of Orange, Pygmalion, Black Douglas, Mdme. Elise Dordan, Osiris, Harry Hicks, Comte de Morny, Madame Marthe, Rubra Perfecta, and Madame Marthe. Mr. T. Caryer, gardener to A. G. Meissner, Esq., Weybridge, staged well; while Mr. G. A. King brought up the rear. Class 26 for Anemone-pompons was not found.

The single varieties (class 27) were shown in only one class, and although only three competitors faced the judges, they worthily upheld this section. The premier award fell to Mr. A. Dear, gardener to W. Jordan, Esq., Palmers Green, who staged Admiral Sir T. Symonds, Elsie Neville, Annie Farrant, Edith, Earlswood Beauty and Crown Jewel in grand style; Mr. H. Redden, gardener to G. W. Bird, Esq., West Wickham, came second with good bunches of Mrs. Forbes, Frank Redden, and Crown Jewel; while Mr. W. C. Pagram was third.

### FLORAL DECORATIONS.

These were of rather ordinary quality, and not numerous. In class 28, for three epergnes, the three competitors showed well. Miss Cole, Feltham, was first with a very elegant light arrangement of yellow and bronze, with Ampelopsis and Croton foliage and Asparagus trails; second, Mr. D. B. Crane, with a nice arrangement of yellow. In class 57, for two hand bouquets of Chrysanthemums, there were also three competitors; whose productions were not specially effective. Mrs. Brewster, Canterbury, was awarded first prize, Mr. Olliver second, and Mrs. Taylor, East Finchley, third. In class 59, for a basket of foliage and berries, there were only two competitors. Mrs. Taylor, East Finchley, was first with a very attractive exhibit; Mrs. Brewster, second. Miss Cole exhibited a very graceful basket of foliage not for competition. In the class for a basket of Chrysanthemums, Miss Anty, West Norwood, was first, with a very handsome arrangement; second, Miss Cole; and third, Mrs. Crosby Smith, Loughborough Road. These were also very attractive. For one vase of Japanese blooms (c. 30), with any foliage, Mr. Barrell, gardener to Mrs. Thornton, The Hoo, was first with very handsome blooms of Mrs. Barkley, with Nephrolepis foliage. Mr. A. King, Knightons, East Finchley, second, with Le Grand Dragon. In class 58, for one vase of six Japs; with any foliage, Mr. Prestell, of Elston, was first, with very beautiful blooms of F. S. Vallis, decorated with Croton leaves, grasses, and Asparagus. Mr. A. Robertson was second with Mrs. Barkley. Ten vases pompon Chrysanthemums (c. 29), Mr. Robertson, gardener to J. F. Yarrow, Esq., St. John's Wood, was first with a very commendable exhibit; Mr. Pagram, Weybridge, second.

CLASS 55.—Mr. D. B. Crane, of Highgate, here led against four, winning the silver challenge cup outright, for the display of cut decorative Chrysanthemums. Mr. P. L. Johnson, Bishop's Stortford, second; and Mr. C. F. Court, Plaistow, third.

CLASS 56.—Miss Mary H. J. Antey, West Norwood, won the silver challenge cup given by Mr. Waterer for a decorated table, using orange-coloured flowers. Mr. D. B. Crane used yellow, white, and pink to more effect, yet came second. We sincerely sympathise with Mr. Crane for the number of times he is placed second, when his taste and skill, in our opinion, place him an easy first. We also hear what the visitors say. Mr. Taylor third.

### AMATEURS' CLASSES—Section A.

There were but two competitors in the class for eighteen Japanese blooms, distinct, the first prize being awarded to Mr. C. Bellis, gardener to Mrs. G. M. Faulkner, Forest Hill, whose best blooms were F. S. Vallis, Mrs. Barkley, Madame Waldeck

Rousseau, Miss A. Byron, and Chas. Longley. Mr. A. W. Seabrook, gardener to W. Willes, Esq., Ellerslie, Buckhurst Hill, Essex, was a good, even second.

The class for twelve Japs was well contested, there being five exhibitors. Mr. A. Osmond, gardener to A. Kempt, Esq., South Norwood, won the first prize with nice flowers of W. R. Church, Matthew Smith, Mrs. Barkley, and Nellie Pockett. Mr. L. Gooch, gardener to T. W. Jones, Esq., South Norwood, was second. Class 34 was for twelve distinct incurved varieties. This was well won by Mr. A. W. Seabrook, who had good flowers of Duchess of Fife, Countess of Warwick, C. H. Curtis, and J. Lyne. Mr. H. W. Culham, gardener to D. Birt, Esq., Blackheath, followed next.

**Section B.**—For eighteen varieties there were but two competitors, the first prize falling to Mr. A. R. Knight, Ashford, who staged a bright set. His best blooms were Godfrey's Pride, The Princess, Lady Beaumont, Mrs. G. Mileham, W. R. Church, and Sensation. Mr. F. Wells, 181, Albert Road, South Norwood, was second, and had a good lot too.

For twelve Japs (class 36) there were six entries. Mr. A. F. Hill proved the victor with a stand that would have done credit in the open classes. The best blooms were F. S. Vallis, Mrs. E. Thirkell, Madame P. Radaelli, C. J. Salter, and Duchess of Sutherland. Mr. E. Ogden, High Street, March, was second; and Mr. H. E. Hawkins, Blackheath, third.

#### FLORAL COMMITTEE.—NOVELTIES.

The exhibits on this occasion were very numerous, especially in Japs and singles. The committee, however, place such a high standard of merit on the flowers that few obtained awards. Many of those passed will perhaps be seen to advantage in future exhibitions.

*Mrs. Barnard Hankey* (W. Higgs).—A very large incurved variety, very like Lord Wolseley in colour, and more glorified in form. (See also report of class 6.) F.C.C.

*J. H. Silsbury* (Mr. Silsbury, Shanklin, I.W.).—A beautiful Japanese variety with long petals, terra-cotta colour with a gold reverse, the tips of the petals curling gracefully. F.C.C.

*W. Pascoe* (T. Bullimore).—A good incurved pink, with true shell-like petals, a trifle rough as exhibited, large, and may be better staged. F.C.C.

*Mrs. J. Dunn* (H. J. Jones).—A fine variety, white, with creamy centre, good deep flowers, drooping petals. F.C.C.

*Pink Beauty* (Mr. H. Redden).—A nice single pink, described by the name. Commended.

*Miss Alice Dighton* (W. Higgs).—A good incurved form, straw yellow, of good size and nice petal; an acquisition. F.C.C.

*Miss Jessie Dean* (H. J. Jones).—A good single pink with a white centre, staged in sprays. F.C.C.

#### FRUIT CLASSES.

Six classes were allotted to the fruit division, the first being for three bunches of white Grapes, where three exhibits were staged. Mr. W. Taylor, gardener to C. Bayer, Esq., Tewkesbury Lodge, Forest Hill, won handsomely with well coloured Muscat of Alexandria. Mr. W. Lintott, gardener to W. Greenwell, Esq., Marden Park, was second; and Mr. Jas. Bruce a poor third. The black Grapes class, from which Gros Colman was barred, brought three entries. Mr. W. Lintott won with Black Alicante; Mr. W. Taylor followed with better colour, but smaller bunches; while Mr. J. Preece was third, with very large bunches lacking in colour. The three bunches of Gros Colman only induced one competitor, Mr. Taylor, who had heavy bunches.

The six dishes of dessert Apples had three entries. First fell to Mr. W. Stowers, gardener to G. H. Dean, Esq., Whitehall, Sittingbourne, with Blenheim Orange, Cox's Orange, Allington, Ribston, Gascoigne's and King Pippin. Mr. Chas. Crane, Maidstone, second; and Mr. W. Lintott third. Six dishes of culinary Apples brought out only two entries, Mr. W. Stowers leading with Bramley's, Peasgood's, Lane's, Mère de Ménéage, Bismarck, and Gascoigne's. Mr. Chas. Crane was second.

#### VEGETABLES—CLASSES 64 TO 77.

For a collection of nine kinds, Mr. A. Basil, Woburn Park, Weybridge, won Messrs. Webb's first prize; and Mr. W. L. Bastin was second. The Carrots (New Prizewinner), Beet (Volunteer), Autumn Queen Cauliflower, and Onions were good in Mr. Bastin's set. For a collection of eight kinds (class 77) Mr. R. Mairs, Shobrooke Park, Crediton, Devon, was leader; Mr. C. Brown, Langley House, Abbot's Langley, second; Mr. H. Folkes, Gaddesden Place, Hemel Hempstead, third; and Mr. A. Basil fourth.

For three Cauliflowers Mr. H. Folkes led with Veitch's Autumn Giant out of five. Three Savoy Cabbages: R. Nairns, out of six entries. Three Red Cabbages: R. A. Horspool, Ruabon, out of five entries. Plate of Brussels Sprouts: A. Basile with The Wroxton, out of six. Six Carrots: A. Basile, with new Scarlet Intermediate St. Valery, six competing. Six sticks of Celery: H. Folkes, with Bibby's Defiance (a good white), five entering. Six Parsnips: A. Basile, with Hollow Crown, out of five. Six Beets: A. Basile, with Pragnell's Exhibition, six entering. Six Leeks: R. Mairs, with The Lyon, very thick, and about 12in blanched, five staging. Eight Onions: R. Mairs, with

good Ailsa Craig, out of five. Nine White Turnips: H. Folkes, with Model White Stone (real beauties), there being six displays. Two varieties of Potatoes, eight of each: R. A. Horspool (unnamed); there were six entries.

#### NON-COMPETITIVE EXHIBITS.

Mr. H. J. Jones, Ryecroft Nursery, Lewisham, made one of these displays for which he is so justly famous. The whole group was bold and effective. Huge vases were filled with Japanese varieties, such as Mrs. J. Dunn, a grand white; Miss Olive Miller, Hon. Mrs. Ackland, F. S. Vallis, Nellie Bean, Duchess of Sutherland, and Edith A. Fuller. These were all arranged with Bracken and other autumnal foliage. The specimen blooms included good examples of Mrs. J. C. Neville, F. S. Vallis, E. H. Parker, Maud du Cros, W. Duckham, Major Powell Cotton, Chas. Hobbs, and Colonel Garratt. A good collection of singles and decorative varieties were also on view. Needless to say, the exhibit was most artistically arranged. (Large Gold Medal.)

Messrs. Cannell and Sons, from Swanley, set up their brilliant Geranium flowers in bunches, and the top of the table was crowned with Lorraine Begonias. We note the names of some of the Geraniums in our Highgate report. They also contributed a conical, rounded group of Cannas, a table of exhibition Chrysanthemum blooms, and a splendid exhibit of highly coloured, unblemished Apples. They had dishes of St. Joseph Strawberry, and trusses of Raspberry Surprise d'Automne (yellow). Lastly we would name their immense exhibition Onions, but with them there were others for everyday use. (Large Gold Medal.)

Mr. W. J. Godfrey had a large display of cut Chrysanthemum blooms, but the travelling and the draughtiness of the Palace had not improved them. We noted F. S. Vallis, Exmouth Rival, Britannia, Godfrey's Masterpiece, Mafeking Hero, Kimberley, Loveliness, Miss Elsie Fulton, Bessie Godfrey, and Glory of Devon, each in fine form. (Gold Medal.)

Hobbies, Limited (Mr. J. Green), Dereham, Norfolk, had a really remarkable collection of cut Roses, wonderfully bright and pure. They had also an enormous display of Chrysanthemums, the whole exhibit extending to 125ft in length and about 4ft broad. We would especially draw attention to this firm's set of Cactus flowered Geraniums (Pelargoniums) which are absolutely novel and very pretty. They are Cactus Beauty, rosy carmine, semi-double; Cactus Gem, a sweet rose-pink, single; Cactus King, a semi-double, markedly fluted and deeper coloured than Beauty. Cactus Queen is intermediate between King and Beauty. These, we may add, are of the "Fire Dragon" type, the brilliant scarlet variety that was sent out a year or two ago. The whole display was wonderful in extent, beauty, and variety. (Gold Medal.)

Mrs. John Russell, Richmond, staged Apples, fruits, and a group of evergreen shrubs. (Silver-gilt Medal.)

Messrs. Geo. Boyes and Co., Aylestone Nurseries, Leicester, set up Tree Carnations in pots, and also as cut blooms. These were specially fine, and we hope to have more to say of them. (Silver-gilt Medal.)

From Messrs. J. Ambrose and Son, Cheshunt, came a large display of Palms, Roses in pots, Carnations in variety, Cyclamens, Ericas, Lily of the Valley, Crotons, and Azalea mollis, the whole being nicely arranged, though perhaps it would have looked better in a smaller space. The same exhibitor had fine bunches of the new Melton Constable Grape. The bunches were good in colour and berry, though the bloom had departed, evidently through constant exhibiting. (Large Silver Medal.)

Apples in dishes also came from J. Peed and Son, of West Norwood, London, S.E., and they also set up a large table of Lorraine and Turnford Hall Begonias. This was an immense and graceful display. (Silver-gilt Medal.) Messrs. Cheal and Sons, Crawley, set up a display of very handsome Apples. (Silver-gilt Medal.)

One of the prettiest groups in the Palace was that comprising the winter-flowering Begonias from J. Veitch and Sons, Limited, Chelsea. Here and there was placed a finely formed Gesnera (Nagalia exoniensis with crimson leaves. (Gold Medal.)

Messrs. Cutbush and Son, Highgate, London, N., Lobelia tenuior, Tree Carnations, Alpines, and evergreens. Their berried Perennettas were charming subjects; so, too, was Primula megasæfolia, with lilac flowers; Egeria philadelphicus, Chrysogonum virginicum, Crocus Damascenus, and Campanula muralis major. A varied and interesting display. On another stand they had an immense quantity of seasonable greenhouse plants—Ericas, Spiræas, Liliums, &c. (Gold Medal.)

Messrs. Thomas Rochford and Sons, Limited, Turnford Hall, displayed in no mistakeable manner the development of the retarding art. Their exhibit would have been impossible a decade ago, and it comprised Liliums auratum, L. longiflorum, L. tigrinum, splendens, speciosum album, s. rubrum, and tancifolium roseum; while Spiræas, Azalea mollis, and a grand display of Lily of the Valley were other features. (Gold Medal.)

From Messrs. Gregory and Evans, Longlands Nursery, Sidcup, came a nice table of Ericas, which included E. gracilis

nivalis, E. gracilis autumnalis, also E. hyemalis, and E. h. alba, all beautifully grown and well developed. (Large Silver Medal.)

Mr. Pattison, of Streatham, showed his patent lawn horse-shoes; and "Lawes," together with the Ichthemic Guano Co., sent samples of their manures.

### Royal Horticultural, Drill Hall, November 10th.

An excellent display of Chrysanthemums, Orchids, Zonal Pelargoniums, Ferns, stove and greenhouse and hardy plants was made, in addition to which, autumn foliage was used to decorate some of the exhibits.

#### Fruit and Vegetable Committee.

Present: Geo. Bunyard, Esq. (in the chair); with Messrs. J. Cheal, H. Esling, S. Mortimer, A. Dean, J. McIndoe, G. Kelf, H. Markham, G. Reynolds, G. Wythes, F. Q. Lane, J. Willard, G. Norman, J. H. Veitch, and W. Poupart.

Fruit was rather slack, the only award being given (against the rules?) to a new seedling Melon from Capt. Holford, Westonbirt, Tetbury, Glos. (gardener, Mr. Chapman). This was a green fleshed variety of good flavour.

Apple, Norfolk Beauty, which received an A.M. in October, 1901, and a F.C.C., December, 1902, was shown by Col. Harbard, Gunton Park, Norwich (gardener, Mr. Allen). The dozen fruits were large and of an old gold colour slightly flaked or speckled with russet. Mr. J. Ambrose exhibited the new Grape called "Melton Constable."

#### Orchid Committee.

Present: H. J. Veitch, Esq. (in the chair); with Messrs. J. O'Brien (secretary), E. Ashworth, W. H. White, W. H. Young, W. Boxall, H. J. Chapman, T. W. Bond, J. Charlesworth, A. A. McBean, F. W. Ashton, A. Hislop, J. Coleman, A. F. Moore, F. Wellesley, W. Cobb, H. Ballantine, and A. Bilney.

Messrs. Low and Co., Bush Hill Park, Enfield, were awarded a Silver Flora Medal for a collection of Orchids, in which *Cattleya Dowiana* (true); *C. labiata*, and *C. L. Amesiana*—a fine white form with a mauve lip—were chiefly conspicuous.

J. J. Coleman, Esq., Gatton Park, Reigate (gardener, Mr. Bound), exhibited a large group of remarkably well grown *Cattleya labiata*, with a few *Cypripediums*, *Vanda cœrulea*, *Cymbidium Tracyanum*, and *Dendrobium Phalaenopsis*—the whole being artistically set off with plants of *Asparagus Sprengeri*, and Maidenhair, (Silver Flora Medal.)

J. Bradshaw, Esq., The Grange, Southgate (gardener, Mr. Whitelegg), had a pretty and effective little group of *Cattleyas* and *Oncidiums*, which received a Silver Flora Medal.

An Award of Merit was given to *L. C. Wrigleyi*, Veitch's variety—a deep crimson purple variety, between *L. anceps* and *C. Bowringiana*.

H. L. Bischoffsheim, Esq., The Warren House, Stanmore, Middlesex (gardener, Mr. Ellis), staged a collection of *Cattleya labiata*, *Oncidiums* and *Cypripediums* (Silver Banksian Medal).

Mr. A. A. Peeters, Brussels, received a Silver Flora Medal for some fine hybrid *Cattleyas*, in which a very large and highly-coloured form of *Lælio-Cattleya Wrigleyi* received an Award of Merit; also, *C. St. Gilles*, a deep coloured form. *Odontoglossum Waltoniense*, in a much improved condition, was shown by W. Thompson, Esq. (gardener, Mr. W. Stevens). It received a F.C.C. in January last.

S. Clayton, Esq., Wylam-on-Tyne, sent three large plants of *Calanthe*, with enormous bulbs and leaves, and fine sturdy trusses of blossom. (Cultural Commendation.)

F. Wellesley, Esq., Westfield, Woking, exhibited a strong plant of *Cypripedium Ville de Paris*, a large flower of the insigne type, to which an Award of Merit was given.

A First-Class Certificate was given to *Lælio-Cattleya Bletchleyensis* var. "Ruby King," a large ruby red variety, shown by Baron Schröder, The Dell, Egham.

E. Ashworth, Esq., Harefield Hall, Wilmslow, Cheshire, exhibited *Cypripedium Fulshawense* (Boxalli × insigne Harefield Hall var.). It is a fine hybrid with large dorsal sepal and highly-coloured petals and lip. (Award of Merit.)

Messrs. Charlesworth & Co., Bradford, were awarded a Silver Flora medal for a select group of *Cattleyas*, *Odontoglossums*, *Cypripediums*, &c.

Sir F. Wigan, Clare Lawn, East Sheen (gardener, Mr. Young), exhibited a fine plant of *Cattleya labiata Amesiana*, with white petals and mauve-lilac lip; also the rare *Cypripedium Muriel Holington*.

#### Floral Committee.

Present: H. B. May, Esq. (in the chair); with Messrs. G. Nicholson, C. T. Drury, J. Walker, Amos Perry, J. Jennings, Wm. Howe, G. Reuthe, C. R. Fielder, Chas. Dixon, Ch. Jeffries, H. J. Cutbush, C. E. Pearson, C. E. Shea, W. P. Thomson, E. H. Jenkins, W. J. James, J. W. Barr, F. Page Roberts, E. Mawley, and R. W. Wallace.

Chrysanthemums formed the chief feature of the exhibits submitted to this committee. Messrs. W. Wells and Co., of Earlswood, secured Award of Merit for two varieties, viz.: "W. A. Etherington," a beautiful massive blossom of a silvery mauve. It grows 4ft high, and may be described as a large Viviani Morel; and "Kitty Bourne," a single, of bright golden yellow, very free flowering, and useful for cutting. In addition, Messrs. Wells were awarded a Silver Flora

Medal for their fine collection of incurved Japanese, singles, and decorative varieties.

Mr. F. W. Smith, of The Hollies, Weybridge, exhibited a collection of single-flowered Chrysanthemums of various colours, set off by ornamental Gourds, edible and poisonous Fungi, and autumn foliage.

From Lady Plowden, Aston Rowant House, Oxon (gardener, Mr. W. H. Clarke), came a very fine collection of single and decorative Chrysanthemums, in which some extremely fine blossoms were conspicuous. (Silver Banksian Medal.)

Mr. J. T. Bennett-Poë, Holmewood, Cheshunt (gardener, Mr. Downes), exhibited four pots of *Nerines*, and secured an Award of Merit for "Mrs. Moore," a deep blood crimson variety; and for "Miss Woolward," a beautiful salmon pink with a deeper line down the centre of each petal.

Messrs. Hill and Son, of Edmonton, exhibited a fine collection of Ferns, in which there were some large and beautifully grown specimens of *Asplenium Nidus*. Amongst the others were some good plants of the remarkable *Acrostichum crinitum*, *A. viscosum*, *A. scandens*, *A. tomentosum*, and *A. sorbifolium* (Silver Flora Medal). Messrs. J. Ambrose and Son, Cheshunt, Herts, staged a group of pot-grown Roses, set off with Lily of the Valley, *Astilbe japonica*, *Crotons*, &c.

Messrs. Cutbush and Son, Highgate, had an interesting collection of dwarf trees and shrubs, hardy and rock plants, &c. Mr. J. Russell, of Richmond, secured a Silver Banksian Medal for a fine collection of beautiful flowered and berried trees and shrubs.

Messrs. W. Bull and Sons, Chelsea, had a group of very rare and select stove plants and Selaginellas, including *Ceropegia Woodii*, a creeping plant with roundish silvery leaves; *Æchmea Weilbachii*, *Selaginella africana*, *Maranta insignis*, and *M. picta*. A very effective collection of coloured leaved *Acers*, *Berberis*, *Prunus*, *Oak*, &c., came from Messrs. J. Cheal and Sons, Crawley. Mr. G. Reuthe, Keston, Kent, staged several specimens of *Nerines*, nearly all garden forms. A grand and glowing collection of Zonal Pelargoniums occupied the centre of the hall (Silver Banksian Medal). Mr. George Prince, Oxford, exhibited a charming collection of cut Roses, and received a Silver Banksian Medal.

Miss Adamson, South Villa, Regent's Park (gardener, Mr. G. Kelf), occupied nearly half of one side of the Hall with a first-rate collection of specimen Chrysanthemums, Palms, *Crotons*, *Dracœnas*, *Dieffenbachias*, *Poinsettias*, *Arums*, and *Begonia Gloire de Lorraine*—all arranged effectively. (Silver Flora Medal.)

Messrs. T. S. Ware (1902), Ltd., Feltham, staged a large collection of hardy herbaceous flowers, amongst which *Gladioli*, *Tritomas*, *Pentstemons*, *Gaillardias*, *Lobelia cardinalis*, &c., were particularly fine for the season.

### Southampton, November 3rd.

The annual exhibition was held in the Victoria Hall, and was a great success in every way. Cut blooms were the leading feature, so numerous and good in quality were they. The principal class was that for thirty-six Japanese in twelve varieties, staged in vases. As first prize the "Victoria" Memorial challenge trophy with £7 was offered. Five competed, making a good display. Mr. G. Hall, gardener to the Dowager Lady Ashburton, Melchet Court, Romsey, was the premier prize-taker, with large handsome blooms of *Mdme. P. Radaelli*, *Bessie Godfrey*, *Mrs. Lewis*, *General Hutton*, *W. R. Church*, *Mrs. Mease*, *Mdme. Carnot*, *Mrs. G. Mileham*, *F. S. Vallis* (this was adjudged the premier bloom of the show), *Mdme. Herrewége*, *Marquise de Venosta* and *Calvat's Sun*. Mr. Dawes, gardener to Mrs. Ogilvie, Hambledon, Cosham, was a good second, with the following varieties in good condition:—*W. R. Church*, *Sir H. Kitchener*, *M. Hoste*, *Mrs. Greenfield*, *Pride of Madford*, and *J. R. Upton*. Mr. G. Hunt, gardener to Pantia Ralli, Esq., Ashted Park, Epsom, was third with a good set.

Mr. B. Henley, Woolston, with Gustave Henry and Mutual Friend won for three blooms each of any two white varieties. Mr. Dawes second with *Florence Molyneux* and *Gay Hamilton*. For eighteen not more than three of any one variety, Mr. Pearee, gardener to Mrs. Tragett, Ambridge Danes, Romsey, secured the leading award with good blooms of *Mdme. P. Radaelli*, *F. S. Vallis*, *Mrs. T. Bryant*, *Mrs. G. Mileham* and *M. Louis Remy*. Mr. A. J. Marsh, gardener to M. Hodgson, Esq., Morton House, Kingsworthy, Winchester, second; Mr. B. Henley third.

In the class devoted to amateurs, Mr. J. Love, Park Road, Cowes, Isle of Wight, was first; Mr. F. Chandler, Shirley, second. Single-flowered varieties, arranged in two vases for effect, were best shown by Mr. G. Ellwood, gardener to W. Myers, Esq., M.P., Swanmore House, Bishop's Waltham. For twenty-four Japanese in not less than sixteen varieties, four competed. Mr. B. Hollis, gardener to Major Chichester, Embley Park, Romsey, was first with good specimens. Mr. G. Hunt second; Mr. Dawes third. Japanese incurved were better represented than is commonly the case in this section. Mr. E. Hall was first with typical examples of *T. Carrington* and *Mrs. Weekes*. Mr. Dawes a close second.

Plants were not numerous, but good in point of quality.

For a group of Chrysanthemums arranged in a space of 10 feet by 6 feet three competed. Mr. C. Hosey, gardener

to J. D'Esterre, Esq., Elmfield, Southampton, won the premier award with dwarf plants carrying good blooms and well clothed with foliage. Mr. B. Henley second; Mr. T. Hall, gardener to Sir S. Montague, South Stoneham, third. Plants suitable for conservatory decoration receive much encouragement here. For four Mr. Hosey was first, freely flowered examples. Mr. Dymott was second. In the bush-trained plant class Mr. Dymott again won first place with good examples of free flowering varieties.

Miscellaneous plants were arranged for effect, as usual, in good taste here. Mr. E. Wills, Winchester Road Nurseries, Southampton, was first; Mr. T. Tylor, Queen's Road Nurseries, Freemantle, second; Mr. T. Hall third.

Miss Wills, Anglesea Place, Southampton, had the best ball and bridal bouquets, suitable flowers deftly arranged. For a centrepiece for table decoration Mr. Ellwood won the leading award with an arrangement of Cattleyas, &c. Mrs. R. H. Jeffery, Nursling, second, Mr. E. Ladhams third. The most tastefully-arranged vase of Chrysanthemums was one contributed by Miss Minnie Snellgrove, Oxford Road, Southampton.

Fruit was good in quality if not in quantity. For three bunches Grapes distinct Mr. W. Mitchell, gardener to J. Willis Fleming, Esq., Chilworth Manor, Romsey, won with clean well-ripened samples of Muscat of Alexandria, Mrs. Pinee and Alicante. Mr. G. Eastwell, gardener to L. Walker-Munro, Esq., Rhinefield, Lyndhurst, second. Vegetables were plentiful and good. For eight varieties Mr. Best, gardener to F. Leyland, Esq., The Vyne, Basingstoke, was premier prizewinner with a good collection. In a smaller class Mr. Ellwood won with good produce. Mr. Best second.

### Plymouth, November 3rd and 4th.

The annual autumn exhibition was held in the Guildhall and was a great success. Entries were numerous, and the exhibits close in point of merit. The arrangements, as usual, were of the best, in the careful hands of Mr. C. Wilson, the energetic and experienced hon. secretary, assisted by an efficient committee.

Cut blooms formed the most important part of the show, therefore demand a prior notice. The principal class was for forty-eight Japanese in not less than twenty-four varieties, not more than two of one variety to be staged. Ten pounds were offered as the leading prize. Four entered, making a good display. The coveted honour was somewhat easily secured by Mr. F. S. Vallis, Bromham, Wilts, who staged large fully-developed, highly-coloured examples of the following:—Mrs. J. Lewis, F. S. Vallis, W. R. Church, Mdme. A. Rousseau, Valerie Greenham, Nellie Pockett, Brightness, Mrs. Bagnall Wild, Princess de Brancova, E. Molyneux, Kimberley, Australie, Mrs. Thorneycroft, Mdme. Herrewage, Mrs. J. Marton, Mrs. Mileham, M. Hoste, Elsie Fulton, Mdme. Henri Douillet, Sensation, Charles Longley, Mrs. Greenfield, Mildred Ware, Mrs. J. Bryant, Jean Calvat, Olive Milton, M. Louis Remy, Le Grand Dragon, S. T. Wright, T. Carrington, Calvat's 99, Ethel Fitzroy, General Hutton and Mrs. Ccombes.

Mr. W. Drake, 44, Cathays Terrace, Cardiff, was a good second with an even set of good quality blooms, a trifle smaller than the winning stand. Mildred Ware, Mrs. E. Hummell, Mrs. Mileham, George Lawrence and Sensation were the most noteworthy. Mrs. G. Foster, Glendarrah Gardens, Teignmouth, was a close third, with slightly uneven blooms.

For twenty-four Japanese Mr. Vallis repeated his former success with a characteristic exhibit. Mrs. Lewis, F. S. Vallis, Lily Mountford, Mrs. B. Wilde, W. R. Church, Mdme. A. Rousseau and C. Longley were especially noteworthy. Mr. Brimicombe, gardener to J. R. Gulson, Esq., Teignmouth, was a capital second. Mr. Harding, gardener to T. Martin, Esq., Trevorleyn, Plympton, was third. Seven competed.

Japanese incurred had a class set apart for them, and which produced tolerably good results. Mr. Brimicombe, with neat blooms of The Wonderful and Princess, was the premier prize-taker. Mr. Foster second with loosely-formed examples. Mr. R. Mairs, gardener to Sir J. Shelley, Shodbrooke Park, Crediton, third. White-flowered Japanese (six blooms of one variety) made a good display. Mr. Mairs, with typical examples of Mrs. J. Lewis, secured the leading award. Mr. Brimicombe followed with the same variety. Mr. Foster, with Mdme. Carnot, secured the third place.

For six any other colour there was a brisk competition, General Hutton winning; Mr. Hardinge, gardener to T. Martin, Esq., Plympton, second with Mrs. Mease; while Mr. F. S. Vallis secured the remaining prize for Mr. Foster.

Single-flowered varieties were staged in vases, three sprays of twelve varieties; they were but moderate. Mr. F. Q. Clatworthy, gardener to F. Bradshaw, Esq., Lipton Park, was the most successful. Mr. Damerell, gardener to S. H. Phillips, Esq., Mannamoad, second.

In the classes confined to a radius of fifteen miles from Plymouth, there was a brisk competition. For twenty-four

Japanese in not less than eighteen varieties, Mr. Harding, with a grand set, won the premier award. Mr. H. Dould, gardener to G. F. Winnicot, Esq., Rockville, was second in a keen competition.

For twelve distinct, Mr. J. C. Boulds, 6, Albemarle Villas, Stoke, was an easy first prize winner, with capital examples of W. R. Church, Lord Ludlow, Miss A. Byron, Miss Elsie Fulten and J. R. Upton as the most noteworthy. Mr. Harding was a good second. Mr. Boulds followed up his previous success by securing leading honours for six Japanese with a good set.

Plants were not numerous, but good in quality. For a group of Chrysanthemums arranged in a semicircle, with foliage plants at the back, there were three competitors. Mr. R. G. Thorn, gardener to Mrs. Upton, Cottrell Dormer, Stoke, was first with exceptionally healthy plants, carrying high-class blooms. Mr. J. Hoskins, gardener to Dr. Aldous, Charlton House, Mannamoad, second with a capital arrangement, but with much smaller blooms.

For a group of miscellaneous plants, to include Orchids and Chrysanthemums, three entered, making a bold display in the body of the hall. Messrs. John Webber and Sons, Vinstone Nursery, Plymouth, secured the leading award with a capital arrangement (in a square) of Orchids, Palms, Crotons, Chrysanthemums, Begonias, and Carnations, all effectively blended. Mr. Selby, gardener to Admiral Parker, Delamore, Cornwood, second; Mr. Thorn, third. Wreaths, bouquets and a complete floral display was a distinct gain to the show, so well were they represented. Messrs. J. Webber and Sons had also an effective group of Orchids, comprising Cattleyas, Cypripediums and Odontoglossums in variety, and for which they received the premier award.

Fruit and Vegetables, too, were a fine display. Space, however, forbids a detailed account.

### Cardiff, November 4th and 5th.

In the Park Hall the annual show was held, and was the most successful of the series yet held. Liberal prizes and good management will, as a rule, produce satisfactory results, certainly this was the case here. Mr. H. Gillett is an experienced secretary, ably assisted by an efficient chairman of committee.

Cut blooms were plentiful. The leading class was that for eight vases (three blooms in a vase), distinct varieties of Japanese, staged on stems, with Chrysanthemum foliage only. Mr. G. W. Drake, 44, Cathays Terrace, Cardiff, was the most successful, staging high-class blooms of the following varieties:—Mr. Lewis, Mrs. Barkley, W. R. Church, Duchess of Wellington, Charles Davis, Mdme. P. Radaelli, Mdme. Herrewage and Mrs. Mileham. Mr. J. Duff, gardener to Mrs. Williams, Newport, second with an attractive set; Mr. G. Williams, Manor House Nurseries, Cardiff, third. In the class for twelve Japanese, distinct, Mr. Drake was again first with fully-developed blooms of F. S. Vallis, George Lawrence, Mrs. Mileham, Mdme. P. Radaelli, C. J. Salter, Matthew Smith, Sensation, Bessie Godfrey, Mrs. Lewis and W. R. Church. Mr. H. Townsend, gardener to H. Pitt, Esq., second, Mr. G. Williams third.

For twenty-four incurved Mr. Drake won the premier position with neat, medium-sized examples of the following:—Mrs. Egan, Mrs. Judson, Edith Hughes, Louisa Giles, Mrs. Crooks, Lady Isobel, Mdme. Ferlat and C. H. Curtis. Mr. Townsend a good second with Hanwell Glory, Nellie Threlfall and Mdme. Ferlat in good form.

Classes were provided for amateurs and gentlemen's gardeners, which produced keen competition. The leading class was for twenty-four Japanese in not less than eighteen varieties, for which the "Courtes" Cup and a money prize was given. Mr. E. A. Parsons, gardener to Mrs. J. F. Pain, Cardiff, secured the coveted award with typical examples of the following varieties:—Mdme. P. Radaelli, W. R. Church, Mrs. Lewis, Mrs. Mease, F. S. Vallis, Mildred Ware, Bessie Godfrey, Mrs. Barkley and Ethel Fitzroy. Mr. John Dunn, gardener to Mrs. Williams, Brynglas, Newport, second, with good blooms of popular varieties. Mr. H. A. Allen, Penarth, a good third. Seven competed for twelve Japanese. Mr. A. F. Hill, Cardiff, won quite easily the premier position with F. S. Vallis (premier bloom in the show), Mrs. Lewis, M. Louis Remy, Mrs. Mileham, Mrs. Barkley, Mrs. Thirkell and Mdme. Herrewage. Mr. Edwards, Severn Road, Cardiff, second; Mr. H. Frazer, gardener to D. Adsett, Esq., The Hollies, Penarth, third.

In a class for twelve Japanese in not less than four varieties open to those not employing a regular gardener, a silver challenge cup was offered, and for which seven competed. Mr. Hill followed up his previous success with a pleasing set. Mr. Edwards, second, with Mr. C. S. Arthur, 149, Albany Road, Cardiff, third. In this section Mr. E. A. Parsons won the first place for twelve incurved blooms. For five any one white-flowered Japanese variety Mr. W. Hatherdale, Manor Cottage, Cardiff, secured the pride of place with Mrs. Lewis in really good order. Mr. Edwards, with Mdme. Carnot second. For

a similar number any colour except white, Mr. Allen with Mrs. Mileham secured the leading place quite easily. Mr. Edwards following with Mrs. Mease. Single-flowered varieties were well represented. For half a dozen bunches, distinct, Mr. T. Bindon, gardener to Dr. T. Wallace, Cardiff, was an easy first with handsome examples of Captain Allsop, Emily Wells, Mary Anderson, Mrs. G. W. Forbes, Felix and Ewan Cameron. Mr. T. Williams, 58, Neppceck Street, Cardiff, second. Mr. Bindon won also for the best arranged vase of single varieties.

Cottagers staged marvellous blooms, considering the convenience at command. For six Japanese, Mr. John Morgan, 11, Redlaver Street, Cardiff, was first, showing Bessie Godfrey, Mrs. Barkley and Mrs. Lewis in prime condition. Mr. E. Jones, 41, Cecil Street, Cardiff, won for six incurved.

Plants were good in quality, if not numerous. Mr. W. Treseder, Cardiff, won for a group of Chrysanthemums arranged with foliage plants, with plants carrying high-class blossoms, not too crowded. Mr. G. Williams, second. For two trained specimens Mr. Bindon staged Mdme. Carnot and Mrs. Emmerton, each carrying thirty high-class blooms over deep green leaves. Mr. Treseder had the best for bush-trained plants in Colonel W. B. Smith, Nellie Pockett, Phœbus, and Kate Broomhead. Mr. G. Muse, 22, Wellington Street, Cardiff, second.

For a group of 50 square feet confined to amateurs, Mr. A. Brown, gardener to J. Howell, Esq., Cardiff, was first with dwarf plants carrying good blooms.

Bouquets, wreaths and crosses were—as they always are—a feature of the show. Messrs. Treseder, John Crossling, Penarth, Mr. W. Baggeson, and Messrs. Ellis and Son, Cowbridge, secured the leading prizes.

Exhibits "not for competition" were numerous. Gold medals were awarded to Messrs. J. Cypher and Son, Cheltenham, for Orchids; to Mr. John Basham, Bassaleg, Newport, for fruit; and Mr. W. Treseder, Cardiff, for Roses and Dahlias. Silver medals were also awarded to Messrs. Clibran, Altrincham, for Chrysanthemums, etc.

First-class certificates were given to Chrysanthemums Mrs. J. Dunn (a pure white, long-drooping petalled Japanese—a great improvement on many modern varieties), and Maud du Cros (a huge flower with straw yellow outer florets shading deeper towards the centre), staged by Mr. H. J. Jones, Lewisham.

### Highgate Chrysanthemum, November 4th, 5th, and 6th.

This show is now held annually in the Alexandra Palace on Muswell Hill, W., and is one of the chief in the neighbourhood of London. Mr. W. E. Boyce, who is secretary, devotes a great deal of his time to the business of the show, and arranged the exhibition tastefully. The leading classes are provided with handsome money prizes, while silver cups and medals are somewhat freely bestowed. In the two vase classes, No. 1 and No. 2, there were some really magnificent blooms staged, and these we notice hereafter. The groups, as is usual at shows generally, were, in our opinion, monstrous, and tasty groups have yet to be developed. Could a class not be arranged for both flowers and plants together, so that the public might have something really beautiful to enjoy?

Two new Chrysanthemums were certificated, viz., Harry Shrimpton, Jap, of good size and form, petals narrow and drooping, and coloured a rich golden-chestnut; and incurved, Miss Edith Holding, already described in our pages, both from Mr. W. Seward, The Firs, Hanwell.

The display of fruit and vegetables was creditable, though limited. Cottagers furnished a number of really excellent plants in the orthodox groups, and so keen are some of them that we heard from Mr. Boyce of one who took a quilt from his bed to shade the plants in order to keep them back a day or two for this show! That exemplifies the fascination that floriculture holds. Decorations were again a noticeable feature.

This Highgate society is well endowed with leading Chrysanthemum lights in Messrs. T. Bevan, D. B. Crane, J. McKerchar, G. Saunders, T. L. Turk, A. Taylor, and J. H. Witty, whose names are well known wherever "the golden flower" is especially cultivated. The president is C. F. Cory-Wright, Esq., J.P., D.L., and two of the patronesses are the Baroness Burdett-Coutts and Lady Nina Balfour. Lord Mansfield was president last year.

CLASS I.—TWELVE VASES JAPANESE BLOOMS, DISTINCT, 5 blooms each. Prizes: Silver cup and five guineas, first; five guineas, second; and three guineas, third. Mr. W. Ring, gardener to J. Warren, Esq., Capel House, Waltham Cross, was first, and his set included the following: Lord Salisbury, Mrs. Mease, Mrs. T. W. Pockett, Marquise V. Venosta, Mermaid, Mafeking Hero, M. Louis Remy, Madame Chenon de Léché, Australie, J. J. Thorneycroft (exceedingly good), Madame Carnot, and F. S. Vallis (very handsome). The second prize fell to Mr. G. J. Hunt, from Ashted Park, Epsom, who won the leading prize (a challenge cup, winning it outright) at Croydon the same week. His blooms here appeared to lack in finish. They were Bessie Godfrey\*, Madame P. Radaelli, Miss M. Ware; Miss Elsie

Fulton, Mr. G. Carrington\*, Duchess of Sutherland, Matthew Smith, The Princess, Marquise V. Venosta, Mrs. A. K. Knight, Godfrey's Pride\*, and Madame Herreweg\*. The best are those marked \*. Mr. J. Sandford, gardener to G. W. Wright-Ingle, Esq., Wood House, North Finchley, followed closely for third, and had well-finished flowers of moderate size. The finest examples were Miss Elsie Fulton (a gem), Chas. Longley (very rich and beautiful), Geo. Mileham (a trifle loose), Matthew Smith, and Madame Paolo Radaelli (of good depth and fine form). Mr. J. Kirkwood, of Grass Park House, Finchley, also staged, but his blooms were too far spent. He had Mrs. Greenfield (good), also Duchess of Sutherland and Mrs. G. Mileham.

CLASS II.—SIX VASES OF INCURVED BLOOMS, DISTINCT. Three entries were staged, and the quality was high. Mr. J. Sandford, of Wood House, was placed first, and his six comprised Perle Dauphinoise, Lady Isobel, C. H. Curtis, R. C. Kingston, Globe d'Or, and Jeanne d'Arc. The second award fell to Mr. A. Jones, Hadley Manor, Barnet, his best being C. H. Curtis; and third, Mr. G. J. Hunt.

CLASS III.—GROUP OF CHRYSANTHEMUMS. Year after year we complain of the tiresome, ugly Chrysanthemum groups, whose only purpose seems to be to fill the allotted space. They are abominations that ought to be swept from the exhibition hall to the most hidden recesses of the private gardens or establishments from which they emanate. When will "art" be requisitioned in the arranging of them? The winners here were: first, Mr. T. L. Turk, Southwood House, Highgate; and second, Mr. C. H. Martin, of Raymead, Hendon.

TABLE DECORATIONS.—Some sweetly dressed tables were set up, and there was considerable diversity. Mr. D. B. Crane (Class 5) surpassed himself, and evidently did not intend to leave any doubt about the adjudication this time. He led with a table set with rich yellow pompon and decorative Chrysanthemums, with here and there a dash of crimson from Berberis sprays and Ampelopsis. Smilax and Asparagus being effectively employed. In the next class (6) Mr. G. Shrimpton was first, using white and crimson; and Mr. Crane was second, having his scheme in apricot and bright yellow, which indeed was rich and very fine. In Class 7 six entered (centrepiece), and D. M. Oliver was first with a mean set-up, the flowers being Source d'Or with Asparagus plumosus. The third prize epergne was the best in the opinion of the majority of visitors. Buttonholes and hand bouquets seemed well represented. For the gardeners' hand-basket (Class 12), Mr. Turk led.

VASE CLASSES.—So many as six vases of pompons were on show, and the leaders were Messrs. Turk and E. H. Chitty (Cholmeley Lodge) in this order. Also Turk and Aldridge in another class. The blooms were clean and good. For two vases of Japs. Mr. Chitty was first; J. Adams, Hillside, Fitzroy Park, second; and Mr. Turk third, the quality being high. For one vase of six Japanese Chrysanthemums (Class 21), Mr. W. Austin, North View Road, Hornsey, was awarded premier place.

CUT BLOOMS.—For twenty-four Japs, in eighteen varieties, Mr. Turk led against five others, and his choicest were Mrs. G. Mileham, Mrs. Greenfield, and Godfrey's Pride. Mr. S. North was second, with a good Lord Alverstone. Mr. J. Stevens was third.

In the succeeding class, for a similar entry, but confined to members within a local area, the lead went to Mr. W. J. Bennett, The Highlands, New Barnet who had a very fine exhibit. Sensation was well shown, and also Nellie Pockett, M. Louis Remy, and Lord Ludlow. Mr. J. Brookes, Totteridge Park, made a close second, and Mr. H. Parr third with a good W. R. Church. For one Jap (Class 31) Mr. A. Jones was first with F. S. Vallis, and J. Sandford second with Miss Elsie Fulton. The flowers in the leading classes under this section were of good average quality. For a dozen as cut from plants, with their own foliage, Mr. A. Simmonds, St. Dunstons, Hendon, was an easy first; and second, Mr. J. Kirkwood, but much inferior. For the twelve Anemone varieties Mr. Sandford beat W. Aldridge, of Springfield House, Palmer's Green. These gave a nice variety to the exhibition. Messrs. J. Frost and J. Kirkwood were so placed in Class 39 (members only, twelve Japs), with excellent flowers—a credit to Highgate.

FRUIT was shown on two tables. Mr. H. Parr, of Trent Park, led for six dishes of Apples, Mr. J. Kirkwood second; there being seven entries. Some exceedingly handsome Tomatoes were on view, Mr. Kirkwood leading. For six dishes of Pears Mr. Parr was alone. He staged Bergamot Esperen, Beurré Superfin, Duchesse d'Angoulême, Glou Morceau, Doyenné du Comice, and Catillac. For three bunches black Grapes Mr. Parr beat J. Kirkwood; and third, J. Sandford. For white the order was Parr, Sandford, and A. Jones. For the best collection of kitchen-garden produce (Class 56) the first and silver-gilt medal fell to Mr. R. Tomlin, Red Lion Hill, with excellent vegetables. For a collection of vegetables (Class 66), eight kinds distinct, 20s. first prize, Mr. J. Kirkwood was foremost, and Mr. J. Jones second.

NON-COMPETITIVE EXHIBITS.—Mr. H. Lovegrove, gardener to H. Spicer, Esq., 14, Aberdeen Park, Highbury, staged a group of very creditably grown Cypripediums—C. Spicerianum, and received a silver medal. Messrs. Henry Williams and Sons,

Fortis Green, had a bronze medal for an exhibit of Chinese Primulas, strongly flowered.

Messrs. B. S. Williams and Son, Upper Holloway, London, N., had a group of choice subjects, including Begonia Gloire de Lorraine, Hydrangea Hortensia variegata, Cineraria maritima aurca, Erica hyemalis alba, Chrysanthemum Soleil d'Octobre, and some very useful Cordylines. Gold medal.

A silver-gilt medal for a table of Chrysanthemums was accorded to Mr. G. Saunders, 13, Victoria Cottages, Archway Road, Highgate; and for decorations Mr. J. Williams, from Ealing, had his rural table decorations.

Messrs. Cannell and Sons, from Swanley, brought Zonal Pelargoniums, which they staged in bunches. It would have gladdened their hearts to have heard the eulogiums poured out by the Highgate visitors. The best varieties were Lady Roscoe, Mrs. Brown Potter, Lord Curzon, Cerise, Prince of Orange, Winston Churchill, Lady Tennyson, Mary Beaton, and Barbara Hope. They had also Chrysanthemums. A gold medal was awarded. Messrs. Wells and Co., Limited, Earlswood, Surrey, staged a few Chrysanthemums.

### Weybridge, November 5th.

The fifth annual show was held in the Village Hall, and was remarkable for the excellence throughout the various classes. Nowhere have we seen finer Japanese blooms this season than here. Cut blooms were numerous and good. The greatest interest centred in the class for twelve Japanese distinct, for which a silver cup brought from Japan on purpose was offered, and for which five competed. The coveted honour falling to Mr. J. Lock, gardener to Sir Swinfen Eady, Oatlands Park, Weybridge, for a magnificent set; all were of full size, beautifully fresh, and perfectly staged. The varieties were Mrs. F. Vallis, Madame Nagelackers, H. Stowe, Henry Perkins, F. S. Vallis, Bessie Godfrey, Mildred Ware, Miss O. Miller, General Hutton, W. R. Church, G. Lawrence, Mrs. Mileham, and Edwin Molyneux very fine; Mr. T. Stevenson, gardener to E. Mocatta, Esq., Addlestone, was a good second, staging Sir H. Kitchener, Bessie Godfrey, and General Hutton, especially well. Mr. W. Shute, gardener to Mrs. Machin, Oatlands Park, third.

For eighteen Japanese distinct, Mr. Lock was again successful in carrying off the premier award for a charming display, Ethel Fitzroy, H. Perkins, Mrs. F. S. Vallis, Mrs. Mease, Mdme. Carnot, Mafeking Hero, Mildred Ware, Bessie Godfrey, E. Molyneux, and J. R. Ayston, as the best; second, Mr. Stevenson; third, Mr. T. Carryer, gardener to A. G. Meissner, Esq., Weybridge. Incurved varieties were well represented. Mr. Lock won the premier position for twelve distinct with medium sized, well-finished examples of Mrs. Crooks, Lady Isobel, Miss N. Southam, F. Palmer, Pearl Palace, C. H. Curtis, Louisa Giles, Madame Ferlat and Ialene. Mr. H. Buckmaster, gardener to F. W. Smith, Esq., Oatlands Park, second, with Mr. T. Carryer a close third.

Reflexed varieties were really well staged on this occasion. For twelve, not less than nine varieties, Mr. Carryer, with full-sized examples of Miss F. Lunn, Cloth of Gold, Golden Christine, Clara Jeal, Pink Christine, and Mrs. Forsythe. Mr. C. Beal, gardener to J. R. Anderson, Esq., Weybridge, second.

Pompons were much better represented than usually, Mr. Carryer winning for six bunches distinct, three blooms to a bunch, staging well-developed blooms of Mdle. Marthe, W. Westlake, Prince of Orange, Osiris, Pygmalion, and Mdle. Elise Dordan. Mr. F. Cawte, gardener to E. Luxmore, Esq., Weybridge, second. Single flowered varieties were splendidly staged. For six bunches, Mr. W. C. Pagram, gardener to — Courtenay, Esq., Weybridge, was an easy first with grandly developed blooms of The Bride, Lady Churchill, Edith Pagram, Elsie Neville, Maud Robinson, and Kate Williams; Mr. T. Stevenson, second; Mr. S. H. Levi, third. One class was provided for Japanese in vases, twelve distinct, three blooms of each. Mr. W. Johns, gardener to A. R. Cobbett, Esq., Weybridge, won with a very narrow margin the premier place; Mr. Buckmaster second.

Groups of Chrysanthemums were a feature of the show, so well were they represented. Mr. Pagram won the premier award with an exhibit possessing much taste. Not only were Japanese varieties used in large blooms, but single flowered plants and pompons, especially Primrose League and Snowdrop, were utilised to make this exhibit what it was—thoroughly representative of the Chrysanthemum. Mr. W. Shute second. In a smaller group Mr. C. Beal, gardener to J. Anderson, Esq., Weybridge, was first in a most creditable manner. For one plant, Japanese, not to exceed 4ft in height, to have not less than twelve blooms, Mr. Pagram was first with Ryecroft Scarlet. Mr. Prothero, gardener to Miss Green, Weybridge, second.

For a collection of cut Chrysanthemums, arranged for effect in a tray 3ft by 2ft 6in, Palms, Ferns, or other foliage allowed, Mr. Prothero was the most successful with handsome Japanese flowers, lightly arranged with Ferns, Grasses, &c.; Mr. Pagram second. For six Japanese, any one variety in a vase, Mr. Stevenson, with Mrs. Mileham, won first place, followed by Mr. Carryer.

For six any one incurved variety in a vase, Mr. Buckmaster, with Hanwell Glory, was first, Mr. Carryer, with Duchess of Fife, second.

### Windsor, November 6th.

In the Albert Institute the annual exhibition was held. If the entries were not quite so numerous as in the past, the quality left little to be desired. Mr. C. Sainty, hon. secretary, had all the arrangements well in hand. For a group of Chrysanthemums and foliage plants arranged in a semicircle there were three competitors, Mr. W. Cole, gardener to Mrs. E. B. Foster, Clewer, won first place somewhat easily with dwarf plants carrying good blooms, not too stiffly or too thickly arranged. Mr. W. Lane, gardener to Sir E. Durning Smith, second, with fine blooms on dwarf plants, too crowded in arrangement. For a smaller group confined to amateurs only Mr. J. T. Young was the most successful, with plants adapted for the purpose.

Cut Blooms: Japanese.—For eighteen distinct arranged in a space 5ft by 3ft, with the addition of any foliage, a pretty effect was produced. Mr. G. Lane, with handsome blooms of Harry Barnes, Australie, and Nellie Pockett, lightly arranged on stems 9in to 1ft long, and over a base of Maidenhair Fern. Mr. W. Hearn, gardener to Mr. Gerald Goodlake, second; Mr. D. Hayler, gardener to Lady Dalton Fitzgerald, third. For six vases, three blooms any one variety, there were three competitors. Mr. W. Jinks, gardener to L. J. Drew, Esq., won first prize with really fine blooms of Mrs. T. W. Pockett, Mrs. Mileham, W. R. Church, and Rev. W. Wilks; Mr. Lane, second, with slightly smaller; Mr. T. Jacobs, gardener to A. L. Wigan, Esq., third. For twelve incurved, and the same number of Japanese, a silver cup was offered as first prize, Mr. Wilson, gardener to Mrs. Christie, was easily first, with large, heavy, fresh blooms. Japanese: Mrs. Mease, Rev. Wilks, General Hutton, Mrs. Everton, W. R. Church, and G. J. Warren. Incurved: Louisa Giles, C. H. Curtis, Hanwell Glory, Nellie Southam, Mrs. Judson, Ialene, Lady Isobel, Duchess of Fife, Frank Hammond, Mrs. H. J. Jones, and Topaze Orientale; Mrs. G. Lane, second; Mr. Page, gardener to J. B. Fortescue, Esq., Dropmore, third. For twelve incurved distinct, Mr. Jinks, with large, neatly dressed blooms, was awarded first place. Mr. Baskett, gardener to E. H. Beckett, Esq., M.P., second. For six incurved, any one variety, Mr. Page, with neat even blooms of Empress of India, was first. Mr. Jinks, with large, somewhat rough examples of C. H. Curtis, second; Mr. Baskett, with small, yet pretty blooms of the same variety, third. Seven staged six Japanese, and one variety, Mr. Minty, with Bessie Godfrey in almost faultless condition, won the first place, followed by Mr. Jinks with Mafeking Hero, and Mr. Lane with Mrs. Mileham, in the order here given. The Duchess Dowager of Sutherland provided the prizes for twelve blooms any section, with not less than 12in of stem, with other natural foliage arranged in a basket or vase. For this was keen competition. The first prize was awarded to Mr. Jinks for magnificent blooms of F. S. Vallis, Mrs. Mileham, Mrs. Mease, Mafeking Hero, and General Buller, lightly, yet effectively arranged with Grasses, &c.; Mr. Lane, second; Mr. Page, third. Fruit and vegetables were well shown.

### Devon and Exeter Horticultural.

This society's show was held on Nov. 6 and 7. The clear frost of the night ushered in a cheerful day, a day in which the flowers seemed to me to rejoice. Some friends sent fine collections of fruit and Chrysanthemums. The public owe much to a few people, who strive to give them a yearly treat of great merit. Our old friend, Sir John Shelley's gardener, Mr. R. Mairs, secured first place in a collection of thirty sorts of Apples. His exhibits are throughout of fine quality. The president of the society staged a nice collection of fruit. His gardener, Mr. Ellicott, is able to grow Grapes of perfect form and colour.

The Pears were not specially noteworthy, although some were fine. The fruit was not so good as that seen at Plymouth last week. Sir John Shelley and his neighbour, Sir J. D. F. Davie, took the collection prizes with some good samples. Most of the prizes went to Sir John Shelley and Sir J. D. F. Davie, the other prizetakers being Lord Poltimore, Poltimore Park, Exeter, and Messrs. Bannatyne, W. C. Cleave (Crediton), J. Ham (Cullompton), T. Kekewich ("Peasmore"), &c.

The circle group of Chrysanthemums, 10ft through, staged by Mr. J. Townsend's gardener was very greatly admired, and easily secured first prize. The foliage looked so clean and the blooms so well grown. Mr. Molyneux would not have had trouble in comparison at Exeter, with this exhibit at least. Mr. Brock was awarded second prize: a pretty lot, but some of the blooms looked as if the "drip" had been considerable, a little dirt here and there showing itself. Mr. Rowland, the gardener, however, recovered any loss of his reputation by winning Class 4. A group of choice plants, they were arranged with lightness from whatever point viewed. Although Mr. Heberden's gardener had a fine collection (which came in second), the heaviness and lack of variegation were apparent. There were too many good things of one kind, and too few Grasses and delicate-looking Ferns, &c.

For thirty-six Japanese Chrysanthemums, twelve sorts, three of each, Mr. F. S. Vallis, Chippenham (a grand lot), led; 2, G. Foster, Teignmouth; 3, H. M. Harrison, Barnstaple; 4, B. H. Hill.

Honorary exhibits came from Messrs. Robert Veitch and Son, Royal Nurseries, Exeter, who staged many good plants, and the Northern Star Potato. The sample was grown by Mr. Abrams at "Peasmore" this season; 1lb of seed produced 209lb. Dishes of Evergood, Sir Walter Raleigh, Devonian, General Buller, Sir John Llewelyn, and Up-to-Date Potatoes were also shown by this firm. Among new Chrysanthemums were F. S. Vallis, Ethel Fitzroy, C.I.V., Sensation, Marquise V. Venosta, Miss E. Douglas, Madame W. Rousseau. Choice shrubs included *Cedrus atlantica*, *Pernettyas*, Golden Irish Yew, an ochre-coloured shrub named *Glyptostrobos heterophyllus*, &c.

Mr. W. J. Godfrey was forward with his novelties.

### Royal Horticultural of Ireland.

The winter show of this venerable society, held on November 4 and 5 in the Royal University, Dublin, created a disappointment in its meagre display of Chrysanthemums. However, visitors were agreeably surprised in finding such fine, magnificent fruit in evidence. In the competing plant class for Chrysanthemums no entries were received, hence no plants were in evidence, and that probably was an unique position for Dublin, if not elsewhere. Mr. McKellar, a veritable Sandow for cut blooms, again showed his strength in carrying off the cup for twelve vases of blooms in twelve varieties, and for twenty-four Japs in eighteen varieties a most creditable collection staged by Mr. O'Connor, gardener to A. Pim, Esq., Bellevue, Black Rock, who was second in the previous class, would have been hard to beat, although for him it was simply a walk-over. A few entries in the smaller classes, with those previously noted, saved the society from being flowerless so far as competing classes were concerned, and beyond a nice table of early flowering kinds staged by Watsons, of the Clontarf Nurseries, the distressful tale of the Chrysanthemum in Dublin for this miserable year is told.

Fortunately trade exhibits saved the situation so far as the show was concerned, Messrs. Alex. Dicksons, the Irish giants of Rosedom, having quite an exhibition to themselves in a long table, on which were arranged, amid small Palms and high-coloured little Crotons, a representative collection of seasonable fruit, amongst which Apples were pre-eminent. Near them, on a side table, the veteran Dublin firm of Sir James W. Mackey had a combined exhibit of fruits, vegetables, and foliage, and it was, and has been for years, a revelation of what this firm can do with vegetables from a decorative point of view. The courteous manager presiding over the Mackey exhibit called attention to a dish of rather wretched Potatoes, saying, "That's Northern Star." Humph! That's all. From Jameson's Nurseries, Sandymount, were some glorious wreaths and floral designs displayed at the back of a tastefully arranged miscellaneous group, and Mr. Caulfield's skilful work on the large stand put up by Chas. Ramsay and Sons, of the Royal Nurseries, Dublin, was much admired under the difficulty of a trying light from windows in the rear. The above trio of exhibits were recommended for gold medals by the judges, who likewise appreciated in the same manner a beautiful group put up by Mr. Campbell from the gardens of Lord Ardilaun. The filling of the Classes 10 to 38, comprising fruits and vegetables, was in the aggregate excellent, and without absorbing space in details all honour is due to those exhibitors in producing such results as were shown under the season's adverse conditions. Here and there fine splashes of colour were noticeable amongst the dishes of Apples, but again, great diversity of character was frequently seen in individual varieties. Warner's King was most prominent in the cooking classes, and King Pippin the more frequently shown in dessert dishes. This should mean something for the merits of both in a bad season. The brisk and urbane young secretary, Walter Keating, Esq., certainly deserved a gold medal as well as the exhibits and exhibitors recommended for such by the judges, for the manner in which his two days' work was carried out, the executive, with one exception, having apparently left him to his fate, and the fate of flower show secretaries is not always a particularly happy one, not excepting the Royal Horticultural Society of Ireland—so it has, at least, appeared to—K., Dublin.

### Isle of Wight Horticultural.

The monthly meeting was held at Warburton's Hotel, Newport, on Saturday, November 7. There was a good attendance of members to hear a paper "On the Cultivation of Chrysanthemums" for the production of exhibition blooms, by Mr. J. H. Silsbury, of Shanklin. The subject was dealt with in a most masterly manner. Mr. Silsbury staged some grandly developed and finished blooms, prominent amongst which was a new Jap named after himself. It has long drooping florets and pleasing tints, which doubtless will become popular. Mr. Snook, West Hill, Shanklin, also staged magnificent blooms, the interest centring around a fine specimen Mrs. Barkley, the petals of which had been reversed to obtain the brighter colouring, anent which

operation comment was made. Mr. Snook also staged a bunch of the pretty *Salvia Betheli*. Mr. T. Colister, Steyne, Bembridge, staged a lovely display of Roses cut from open quarters, fine for so late in the season, and some well grown varieties of Apples. Mr. Brett, Mount Gardens, Yarmouth, had the pretty little Aster *Watsi* and *Schizostylis coccinea*. Mr. W. Tribbick had Chrysanthemum blooms, including a superb Madame Gustave Henri, *Salvia splendens*, and named varieties of *Bouvardias*. Two new members were elected. Next meeting will be held on December 5, when Mr. E. C. Goble, F.R.H.S., of Walcot Nurseries, Ryde, will lecture on Tomato culture.

## Young Gardeners' Domain.

### Chrysanthemum Culture.

November with us again, and what have we to make the conservatory and other houses gay but the Chrysanthemum? The Chrysanthemum is very useful, both in bush form and for large blooms, and though it will live under almost any treatment, it is one of the hardest to bring to perfection. The cuttings should be taken solely from the bases of the old stools, taking care not to get any from the stem of the old plant, or trouble will come by the plants continually forming buds when they should be growing. All cuttings should be taken the first week in December, putting five or six in 4in pots round the edge of the pot. Propagation should be performed in a pit or frame where heat could be turned on when necessary, keeping the temperature from 50deg to 60deg. One watering should be given, and this will suffice till the cuttings are rooted. It will also be found necessary to sponge all moisture from the glass every morning.

When rooted, which should be early in the New Year, air and water must be given with caution. Early in February the cuttings should be potted into 3in and 4in pots in a compost of fibrous loam (one-half) leaf soil, spent Mushroom dung, and sand. Little details must be looked into, such as having the pots well cleaned and drained. After potting, the plantlets should be placed again in frames, on ashes, and kept close for a few days till a move is noticed, then more air may be given. Early in April the plants should be sorted, and the varieties which are in the grower's opinion best for large blooms should be potted in 5in and 6in pots, in a compost of two-thirds good fibrous loam, broken about the size of a hen's egg, the remaining third to consist of leaf soil, Mushroom dung, ½in bones, and grit—these in equal parts. The plants should have less air for a week, and then be given as much as possible, avoiding draughts.

All plants intended for bush should, at the sorting time, be pinched and then kept close and shaded till they are breaking away nicely. They are then treated as the plants for large blooms; but the object must be to form bushy plants, therefore if necessary stop them again. The final potting should be given the first week in June. The pots used may be 8in and 9in diameter, and the compost may consist of one-half of rich fibrous loam, the other half to consist in equal parts of the following: Dried blood, leaf soil, wood ashes, lime rubble, crushed bones, and soot. The potting must be firmly done, and pots well drained and cleaned.

A nice sunny space must now be found where the plants can stand on ashes, and be made secure from high winds. A piece of slate must be placed under each pot to stop the roots from going into the ashes. When well rooted, they should have weak manure water twice a week, taking care always that each plant is dry before being watered. Most varieties will come into bud much better if stopped about the middle of June, or when they show a sign of making their natural break. The buds should then come towards the end of August, and will be showing colour in October, when they should be placed near the glass in a vinery or greenhouse. Feeding should be continued till the flower is half-expanded, then may be stopped. At this period a little heat turned on at night will keep the blooms from damping; also at this time the flowers will be infested with green fly and thrips, which pests must be destroyed with nicotine or XL All. It will be found that the bloom will not in any way be injured if it had a little stronger dose than usual. After fumigating, they are then fit for conservatory, or when fully out for cutting. —F. H. W.

TREE-FERNS AT THE MISSOURI BOTANICAL GARDENS were received from the Hawaiian Islands recently. The plants are thirteen to sixteen feet in height, and were sent in fine condition. They are quite an addition to the Fern dome.

CANADIAN FLORIST.—This is the name of a new trade paper, the twelfth number of which we have just received. It is a very small publication, and is not at present illustrated. It chronicles the doings of our Canadian kinsmen who are florists, and as there are 12,000 of them it ought to have a fair clientèle. The subscription is a dollar a year, and the publishing office is at 12, Richmond Street East, Toronto.

### Hardy Fruit Garden.

**PLANTING APPLES.**—Apples should be planted chiefly as standards, bushes, and cordons. The usual size of orchard standards is usually 5ft to 6ft in stem, and these must be planted 20ft apart, at least. Half-standards are 2½ft to 4ft stems, and may be planted 12ft to 15ft apart. Orchard standards are worked on selected Crab stocks. Half-standards, too, are on this stock. The trees grow vigorously, hence the wider distances apart they should be planted. In addition some bushes and pyramids may be grown on this stock. Trees, however, which must be grown in a restricted space require to be grown on a stock which grows less vigorously, therefore the Paradise stock is the best, and bushes, pyramids, and cordons ought to be grown on this. The trees possess more fibrous roots, come into bearing early, and are more prolific. The soil best suited to Apples is a rich, rather adhesive loam, which should, previous to planting, be prepared to a depth of 2ft by trenching or deep digging. Add no manure to soil of this character. Should, however, it be necessary to plant where the soil is very light and poor it will be advisable to incorporate a little decayed material with the soil placed about the roots. The stations or holes for the reception of the roots ought to be wide, so as to admit the roots easily. In arranging the roots spread them out to their full extent, previously, of course, pruning back the injured parts. A prepared compost of a light and pliable character mixed with wood ashes is best to cover immediately over the roots, spreading it from the stem outwards. Spread a mulching of strawy material over the roots, and stake standard trees immediately.

**PEARS.**—Pears, like Apples, are planted as standards, half-standards, bushes, and cordons. Pears are worked on two kinds of stocks. For growing as standards in orchards, and as bushes, pyramids, and trained for espaliers and walls, the Pear stock is suitable. Trees may be grown larger on this stock, but they do not come into bearing quite so early. For growing in restricted gardens, where trees can have less room allowed them than in the larger area of the orchard, the Quince stock is the best. All the varieties of form may be procured except the standard, which is only to be had on the Pear stock. Trees on the Quince stock, in addition to being adapted for restricted space, also come into bearing earlier, and are very prolific. Bushes and pyramids may be planted as closely together as 4ft to 6ft, occasionally root-pruning them while there is a tendency to over-luxuriance. If on Pear stocks and not root-pruned, the same sort of trees will require 8ft to 10ft distance between them. Standards for orchards must have the usual distance of 20ft. Fan and horizontal trained for walls on Pear stocks 15ft apart; on Quince stocks 8ft to 12ft apart. Cordons for walls and fences should be 18in apart. A deep, well-drained loam, lying on chalk, suits Pears well. The preparation of the land previous to planting should be thorough in regard to digging and trenching; but no manure should be added to the soil that is rich enough for good growth. The same care ought to be observed in the details of planting as with Apples.

**PLUMS.**—Plums are grown as standards in gardens and orchards, also as dwarf bushes and pyramids, fan trained, horizontal trained, and as cordons for walls and fences. The dwarf trees are worked on the common Plum stock, standards and pyramids on the Mussle Plum. Plums should be grown in open, sunny positions, whether in gardens, orchards, or on walls or fences. A deep soil is not required, but it should be a moderately moist, sandy loam, and will be improved if intermixed with old mortar. The distances for planting standards should be 15ft to 20ft apart each way, pyramids 9ft to 10ft, fan trained 15ft, bush trained 6ft, to 9ft, cordons to 18in. Plums are usually well furnished with fibrous roots, and on this account they should be kept well covered from the time of lifting until the planting is accomplished, or the tender fibres may be destroyed. Do not plant too deeply, not more than will suffice to cover the roots a few inches. Stake promptly all the standard trees immediately after planting.

**CHERRIES.**—As standards in orchards, and as bushes, pyramids, and trained for espaliers, Cherries are usually worked on Cherry stocks, but some varieties, including the Kentish and Morello, do well on the Mahaleb stock, which is a dwarfing stock for Cherries. In orchards, standards and half-standards the best adapted, planting them 20ft to 25ft apart. Pyramids in gardens may be 15ft apart, bushes 5ft to 8ft, horizontal, or fan trained, 15ft, and cordons 18in. A rich, sandy soil is best for Cherries, and the trees generally should have an open, sunny position. The Morello will do well on north and east walls.

The restricted trees on walls should be grown with a limited number of branches, and the side shoots shortened to form spurs, but the Morellos will be most prolific if old and weak shoots only are removed, and young growths kept from crowding.—EAST KENT.

### Fruit Forcing.

**VINES: EARLIEST FORCED IN POTS.**—Vines started now will afford Grapes fit for table in April, or a little earlier with sharp forcing. For early work not any are better than Black Hamburgh and Foster's Seedling, or for quality, White Frontignan and Madresfield Court. Stout, well-ripened canes, with plump buds, and given a short rest, answer for early forcing. The Vines require a light, airy, efficiently heated structure, which may be a lean-to facing south, or a three-quarter span-roof having the same aspect, or a span-roof with ends east and west. If the hot-water pipes are at the front of the lean-to or three-quarter, also at the sides of the span-roof, the Vines may be stood upon them, placing tiles or slates on the pipes, and standing the pots on them. The tiles or slates become warmed and transmit the heat to the pots, which are more or less warmed at their base, and the roots are not prejudiced by the heat. The tiles or slates also throw off much of the water or liquid manure escaping from the pots, so that there is no risk of a surfeit of steam.

Pedestals of loose bricks should be formed for Vines in beds to stand upon, thus raising them to the required height and preventing sucking. Vines in pots, and restricted thereto, afford excellent fruit with judicious feeding. Oak or Beech leaves are the best for affording bottom heat, they supply a genial warmth and regular moisture in the early stages, and rich, stimulating food when the demands of the Vines are greatest. The house should now be ready, and the plants placed in position. The canes should be kept horizontally, or have the ends depressed, if necessary, to insure their breaking evenly from the base upwards. Damp the Vines and house two or three times a day, and maintain a temperature of 55deg, on fine days 65deg, the heat about the pots not exceeding 60deg to 65deg. Only afford water to render the soil evenly moist, as a wet medium retards root action, and in no wise contributes to a good break, but the reverse.

**EARLY FORCED PLANTED-OUT VINES.**—When young and vigorous Vines have to be started for the first time, to afford ripe Grapes at the end of April or early in May, the house should be closed by the middle of the month, for they do not, as a rule, break so quickly as Vines that have been forced for a number of years. The older Vines that have previously been forced need not be started until the beginning of December. To produce a soft humid atmosphere, and to economise fuel, a good ridge of fermenting material may be placed upon the floor or border, and be turned at short intervals, additions of fresh being made as the heat declines. The temperature of the house should range about 50deg at night, 55deg by day, and 65deg on bright days. The outside border must be protected from frost by a covering of leaves, with a little litter over them to prevent their blowing about. If spare lights are at command by all means use them to throw off heavy rains and snow.

**HOUSES CLEARED OF GRAPES.**—When the Vines are leafless, and the Grapes cut, attend to the pruning without delay, for nothing contributes more to health and a good break than thorough cleanliness, and an early and complete period of rest. Vines in good condition, having stout, short-jointed wood thoroughly ripened, may safely be pruned to a couple of buds. The latter, however, are not always sufficiently developed at the base of the annual growths to give as large bunches as desired, and in that case the laterals may be left a little longer, say, near two more eyes. It is necessary that a plump, round (not large and flat), well-developed bud on stout, hard, thoroughly ripe wood be selected for pruning to, as such usually produces a close, well-set, compact bunch. When the wood has not those characteristics the basal buds are often small, which arises from various causes—sometimes from overcropping, frequently from excessive vigour, at others through overcrowding, and oftentimes from weakness. The result is small bunches when hard and fast lines are practised. Wash the Vines with tepid soapy water, such as paraffin softsoap, 4oz to a gallon of water, using a brush, yet with care and judgment, so as to reach and dislodge any hibernating pests. Remove the remains of the mulchings, also the surface material, down to the roots, especially near the collar, and supply a top-dressing of turfy loam chopped up moderately small, and to a barrow-load (about three bushels) add a pint of steamed bonemeal, a quart of soot, and half a gallon of wood ashes, incorporating thoroughly. Where the houses must be used for plants they should be kept cool, not exceeding 40deg to 45deg, ventilating freely above that temperature.

**HOUSES OF THIN-SKINNED GRAPES.**—The soil and atmosphere having been saturated by rain, these have caused Grapes that have been ripe since August, particularly Black Hamburghs, to damp considerably in spite of free ventilation and a genial warmth in the hot-water pipes. The Vines that ripened their crops in September are still in foliage, and must bear more

moisture at the roots and in the atmosphere; indeed, moderate moisture in the atmosphere is necessary to prevent undue evaporation and the shrinking of the Grapes. A slight warmth in the hot-water pipes will be required almost constantly to maintain an equable temperature, but this must not be too high, or it will dry the atmosphere and cause the Grapes to shrivel prematurely. A temperature of 40deg to 45deg at night, and 50deg by day, will be sufficient, ventilating freely and early in bright weather, so as to prevent moisture being deposited on the berries. Outside borders should be covered with lights or tarpaulin to throw off heavy rains. Remove all fallen or matted leaves, practising every precaution against damp and mould.

**LATE GRAPES.**—These do not always finish well, and this usually arises from three primary causes, namely, starting the Vines too late, and not accelerating thorough growth during the spring and early summer months, so as to give the Grapes the full benefit of the summer sun to swell and ripen. Overcropping, too, not only prejudices the current crop, but militates considerably against the succeeding year's bearing of the Vines. A bad condition of the roots is, however, the most disastrous cause of all, for improper food is attended with many evils, and these hinder the perfection of the crop. If the defect is due to overcropping, some relief may be afforded by cutting a portion of the crop at the earliest convenience, and though nothing will be gained by pushing the fire now, the temperature maintained at 60deg to 65deg, with 10deg to 15deg advance from sun heat, so as to secure the thorough ripening of the wood, admitting air freely when the weather is favourable, and leaving a little on constantly. Where the cause can be traced to imperfect drainage or bad borders no time should be lost after the wood becomes sufficiently ripened, or when the leaves give indications of falling, in getting out the old soil, rectifying the drainage, and relaying the roots in fresh compost.

Where the Vines are in proper condition the timely attention to fallen leaves, in clearing away and looking over the bunches for decayed berries, will keep matters straight. Air is the best preventive of mouldiness. A temperature of 45deg to 50deg suits the vinous Grapes, such as Gros Colman, and 50deg to 55deg the Muscats, as both improve considerably after apparently ripe.—**ST. ALBANS.**

\* \* All correspondence relating to editorial matters should be directed to "THE EDITOR," 12, MITRE COURT CHAMBERS, FLEET STREET, LONDON, E.C. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense. In naming plants we only undertake to name species, or well-marked varieties, and only six on any one occasion. Florists' flowers we do not name.

**STREPTOCARPUS SEEDLING, TREATMENT (F. G.).**—The plants now flowering should be kept moderately moist until the flowering is mainly over, and in an intermediate house or cool stove; when the flowering is over they should be kept somewhat drier; indeed, be gradually ripened off by diminishing the supplies of water, and when the foliage has mainly decayed water may be entirely withheld. The plants can then be stood on a damp base with no danger of drip falling on them, and the roots will then keep sound until the spring, when they should be shaken out, repotted, and started in gentle heat.

**BANKSIAN ROSES NOT FLOWERING (Idem).**—The most common cause of this is non-maturity of the wood, often aggravated by keeping or allowing too much growth, so that the shoots have not full exposure to light and air, and in consequence are soft and unripe. Another cause is severe or close pruning, whereby a number of soft growths are made, and the consequent crowding results in weakly and immature shoots. This Rose requires very little pruning, merely cutting out the old growth in favour of young, and training the shoots rather thinly, so as to secure thoroughly solidified growth and well-ripened wood. Then it blooms freely under favourable conditions, as against a south wall, only the immature points of the long shoots being shortened to sound, well-ripened wood.

**DRESSING FOR CUTTING BOXES (X. Y. Z.).**—The usual dressing for Hop poles is creosote. This is an excellent preservative of wood in or out of the ground, but it is not suitable for the purpose you require, nor for dressing the woodwork of plant or fruit houses. A safe and excellent dressing for woodwork used for horticultural purposes is Stockholm tar, thinned to the consistency of paint with paraffin oil. The woodwork, boxes, stages, &c., should be thoroughly dry, and the dressing

applied with an ordinary paint brush, apply as a priming coat to both inside and outside of the boxes. Three coats may be given to the outside, allowing the first coat to become dry before applying the second, and so on between the second and third. The woodwork so treated has a brown colour, and when dry may be painted any colour required if so desired, as for stages, &c., though for boxes this may not be considered necessary.

**PORTABLE PEACH-TREE WALL COPING.**—If tender Peaches and refined Pears cannot be sheltered by means of a full glass-case (the Peach-case as usually spoken of) the next best thing as a means of protection, is the wall coping. These copings are useful in this, that they prevent a certain amount of vertical

heat radiation, which if uninterrupted, results in such cooling of the exposed surfaces of growth, that harm ensues. Frost is said to be due to loss of heat by radiation. If a glass coping can prevent a certain amount of radiation, say to the extent that would register two or three degrees of

frost, then it serves a very useful purpose. When trees are in blossom we do not expect many hard frosts, though sudden "snaps" are not uncommon; and these often destroy a season's promise of fruit. A little extra outlay then, in providing copings or cases, is desirable. Our illustration here is from Mr. Duncan Tucker, the horticultural builder, of Tottenham, N. In these portable copings the glass is removable, and can be stored away all summer and winter, being mainly of use in the spring.

**DRAINING A FIELD (S. S. W.).**—The first point to be determined is the outlet. This should always be at the lowest point of the land, or such as will afford a sufficient fall for the water; the outlet pipe should not be at the immediate bottom of a ditch, but above the water ordinarily running in it. The main drain, or drains, must be at the lowest part in the line of the greatest slope, and all the minor drains must enter the mains diagonally in the same direction as the run of the water, and not at right angles. A 4-inch main drain is usually sufficient to carry off the water from five or seven acres; but where the land is springy larger mains or more of them are required. The drains should not be less than 3ft deep, and where there is sufficient fall they are better 3½ft to 4ft deep. A smooth and even fall and certain outlet must be provided. A sharp fall is not necessary. The distance of the drains will be determined by the nature of the soil. Sandy, gravelly, or silty subsoils draw well, and the drains should be 24ft apart; for medium textured subsoils, 21ft; for stiff loams, 18ft; and for retentive clay subsoils, 15ft apart. In tenacious soils it is a good plan to fill the trench with stones up to the level of the disturbed soil, or, say, 2ft from the surface; but in soils that are springy, as happens in sand, a little straw on which to lay the pipes is necessary, covering them lightly with the softer portions of hedge brushings, to prevent their being choked with quicksand. All outlets must be secured with iron grating sufficiently small between the bars to exclude animals of the size of rats, or less. This work of draining must be done carefully and thoroughly, it being essential that the trench be examined before the pipes are laid, in order that any faults may be discovered and rectified.

**NAMES OF PLANTS.**—Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number. (J. F. N.).—1, *Abies pindrow*; 2, *Cedrus Libani*, probably; 3, *Fitzroya patagonica*; 4, *Cupressus cashmeriana pendula*. (F. L.).—1, *Dædalacanthus nervosus*; 2, *Erica hyemalis*; 3, *E. gracilis*; 4, *Jasminum gracillimum*. (S. J. B.).—1, *Tillandsia zebrina*; 2, *Æchmea fulgens*; 3, *Asparagus verticillatus*. (N. A.).—1, *Polygonum molle*; 2, *P. polystachyon*.

**PUBLICATIONS RECEIVED.**—"Bulletin of Miscellaneous Information": New Garden Plants of the year 1902. Royal Gardens, Kew, price 4d. \* \* \* Annual Report of Proceedings under the various Agricultural Department Acts, for the year 1902, price 6d. \* \* \* "The Tropical Agriculturist," September 1. The articles include: The Latest in Fibres, History of the Introduction of Para Rubber into the Malay Peninsula, Mango, its Culture and Varieties, The Invention of a new Artificial Fertiliser, The Supposed new Substitute for Rubber, &c. \* \* "Bibby's Quarterly," autumn number, 1903. The price of this most beautifully illustrated quarterly is 9d., post free, from J. Bibby and Sons, Formby Street, Liverpool. There are twenty-two coloured illustrations throughout the issue, many of them portraying agricultural subjects. Purchasers will find plenty to interest them in "Bibby's Quarterly," dealing as it does with the country, and also home life. \* \* "The Indian Agriculturist," October, 1903. Agriculture. Mineralogy. Statistics. \* \* Agricultural Returns, 1903 (Acreage and Live Stock), price 6d.

## The Water-logged Land.

In too many cases at the present time, the damage, or maybe ruin, of this year's crops are not the only sources of anxiety to the farmer. He is equally concerned as to the prospect for next season. This anxiety is also shared by a majority of those who saved their crops before disaster occurred, so that on every hand we see anxious faces.

The difficulty of sowing Wheat is but a minor one, for on all the lighter soils the seedbed will be sticky enough to ensure solidity, whilst not being an impossible one as is the case on clay or on low lying lands, at any rate at present. An immense amount of land is so sodden that only a continued spell of sharp frost can put it into a cultivable condition, and therefore the sowing of autumn Wheat on a large area of the best Wheat soil, may be at once dismissed from calculation. A great portion of this land is not very suitable for Barley, but on the contrary; and on much of it spring Wheat could not be sown with much prospect of success. Therefore, Oats or spring Beans are the only possible crops, and we think the former holds out the best prospects of success, as it can be grown without yard-manure which, some time or other before seed time, would mean carting it on the land. What we want now is the easiest method of lightening up the soil with the minimum amount of treading, and then a period of forgetfulness, leaving Nature to do her share of the work. The steam drag, which avoids the injurious effect of the horses' feet on the spongy soil, is an invaluable implement just now, and should be used whenever possible. By its means many Potato fields may be sown with Wheat, even under present conditions. It is far superior to the plough in bringing to the surface Potatoes which have been missed, and if the seed Wheat be broadcast by a capable man immediately after the drag has passed, one harrowing with horses will suffice to complete the job. There is, however, such a thing as harrowing by steam, and when the engines can be retained, the superiority of the work would justify the additional expense.

For preparing land to obtain the greatest benefit from the action of winter frosts, nothing worked by horse power can equal the digging plough. Spring-tooth cultivators may be used to stir the soil; they entail less treading and the work is both economical and quickly performed, but if we wished to make a good job of sodden land, we should use the digger, but not in the ordinary way. We should make our furrows as wide as possible and not very deep, using the plough as if we were ridging, and leaving the land in a state somewhat like ridge and furrow. If such a method were found impracticable, then we would use a double-breasted ridging plough and leave the land in ridges until February or March. This method is most successful in the preparation of land for Potato planting, and it sounds reasonable that it should be equally effective in the case of spring corn.

With the whole country in such an abnormal state it may be necessary in ploughing in the ordinary way, to make the lands much narrower than they have previously been, viz., 9yds or 12yds lands instead of 24yds or 36yds. Furrows greatly assist surface drainage, and therefore can hardly be too numerous under present circumstances; but

they will be of little use unless each has an outfall, therefore the land should be ploughed in the way that will the most assist to attain that object. If preferred, and extra expense is not objected to after the ploughing is completed, two or three deep grips may be cut across the ridges to carry the water from the furrows to the main drains. Under the most favourable conditions the land will be a long time in getting rid of the superfluous water, and farmers, instead of wringing their hands and jibbing at the "Clerk of the Weather," will be better employed in giving Nature all the assistance in their power.

### Bad Times in the Villages.

The proprietors of the village stores are complaining bitterly of the badness of the rural trade. They say there is no money circulating; that cash is becoming scarcer every day, and credit longer. Can it be wondered at? There is little extra pay to be earned now at harvest time. A "small" farmer told us the other day that when he was a labourer thirty years ago, he thought he did badly if he and his wife, aided by one or two children, did not earn £18 over the corn harvest. Now there is little or no mowing, no binding, and a bare 5s. per day for leading. Where a labourer used to clear £15, clear, extra money, by harvest work, he now gets 2s. per day extra for a fortnight or so; at most, not much more than 30s. Employment is much more certain than it used to be, and taking one part of a year with the other, is not so badly paid for; but the labourer gets no big pulls now.

The single waggoners have decidedly the best of it with farmers at present. Their wages are good, and the purchasing power of money is high, but very shortly we shall have Martinmas hirings, and perhaps a reaction may take place. Trade is slack in most towns, and a goodly number of single men have lately returned to the villages and are now employed, when the weather will allow, in Potato lifting, threshing, &c. Some of these may require to re-assume the duties of waggoner. The farmer, short of money, and with little to sell, must perforce use every method of retrenchment, and will not hire two men to feed and pay where he can make one fulfil his purpose. Seeing plenty of spare hands about he will prefer to employ them only when urgently needed. Neither the yearly men nor the catch-penny hands are likely to earn so much as they have been used to do, and there can be no improvement in village trade until there has been another harvest. Village prosperity is ruled first by the spending power of the inhabitants, and that in turn hinges on the wage-paying ability of the farmer. We have many times, and very recently, heard both labourers and tradesmen fairly gloat over the misfortunes of farmers. Is a period of acute distress to be the means of correcting the spirit which produces such stupid ill will?

### Work on the Home Farm.

During the past week we have only had one wet day, and more useful work has been got through than in any one week since early September.

We are just finishing the Potatoes, though there are plenty of farmers who have a week or two of work amongst them yet. As far as can be judged, the disease has not spread very much lately amongst those still in the ground, but in many pies it has made great progress, and one grower is very anxious to get his stores turned over, being very much afraid of their collapsing. As we wrote a month ago, it is madness to put disease-smitten Potatoes in big heaps. We have made ours but 6ft wide at the base: it is rather extravagant of straw, but that is plentiful enough.

There is quite a crop of draggings and harrowings to pick up after the rows have been lifted with every care, and we fear many tubers are still left in the land. Some will be found after the plough, but not all.

Careless stacking and dilatoriness in thatching are being held responsible for much loss. Threshing machine men report numerous cases of six, eight, or ten quarters of wet, unsaleable, ungrindable, and almost useless grain from the roof of a stack which had been led in fair condition and of which the lower and dry portion yielded excellent and valuable grain. It is the want of the one nail again which loses so much.

Corn of this kind, which cannot be ground and will not keep, may be given to sheep instead of cake. It also may be given sparingly to horses to eke out other corn, and to pigs which are not too far advanced in fat condition. It is useful in moderate quantity to both suckers and those which have been recently weaned.

Having an abundance of offal Potatoes, we are steaming them freely and giving our feeding pigs very little meal. Potatoes only just touched with disease make capital pig food, either cooked or raw. Pigs which will eat raw Potatoes and do well on them are valuable just now.

Working horses will, of course, be now living entirely on dry food, and should be given a little linseed cake in their water during the winter. Crushed linseed boiled is comparatively cheaper, but the boiling is rather troublesome, and has ruined many a small pair in the process. Yearling horses and weaned foals must have both corn and a little hay, for grass alone is not good enough for them.

## Canada Calls for Britons.

Writing from Winnipeg, Manitoba, Mr. Edgar Wallace, of the London "Daily Mail," says: "The land owned by the Yankee farmer in the States is worth to him, say, anything up to 150 dollars an acre. From this he derives something like five per cent., that is, let us say, 7.50 dollars per acre a year. He knows now that in Canada there are thousands of acres to be had for a third to a half the cost of his own land, that will yield the same crops as his more expensive property; land that, costing him fifty to seventy-five dollars an acre, will return 7.50 dollars per annum. The Yankee does the natural thing. He sells his property, moves over into Canada, and for the money he has received for the sale of 500 acres of American farm-land he buys 1,000 acres of Canadian, as good, if not better, as the soil he has sold.

"There must be in England a large number of investors seeking new and profitable employment for their money, and to these I would point out the thousand and one opportunities for investment. I hesitate to urge any particular form that investment should take; I am satisfied that any transaction in real estate must be profitable, and I am convinced that the influx of British capital into Canada would have a most stimulating effect upon an already prosperous Colony, and would eventually result for the good of the Empire. I am no financier, and do not know how far the change would be possible; but it does seem that if the Imperial conscience could only be awakened, and if the Imperial Briton asked himself once a day, 'How can I help the Colonies?' as religiously as a penitent searches his soul for sin, not only would patriotism become beautiful, but, better still, it would be profitable, for thereby much money now invested in foreign securities and industries would be diverted to the more proper channel of Colonial investment. For Canada, like any other agricultural country, wants money; but unlike most countries similarly situated, she has such excellent securities in her undeveloped resources, and her solvency is so firmly assured by Nature herself, that the fulfilment of her requirements is not so much a question of time as it is a question of source.

"And then, as to men. Surely there are plenty of men in the British Isles who have the health, the strength, and the inclination to work with their hands, and hardy enough to rough it in the most glorious climate in the world? Men with sufficient of the old adventurous strain left to leave the beaten track of home life and hew out a path for themselves and posterity in the virgin depths of this new land? Or must Canada be left to the Galician, the Russian, the Swede, and the Yankee? One would imagine that in this, the most promising of the British Colonies, the British emigrant would be preponderant. Take the figures for last year:

Immigrants from United States..	26,388
Immigrants from Great Britain..	17,259
Galicians, Germans and Scandinavians	10,049
French, Hungarians and Austrians	2,022
Russians and Finlanders	3,759
Other nationalities	7,902

Thus, out of a total of 67,379 Great Britain furnishes less than a quarter. Canada wants men—the right sort of men. That she can draw twice as many from the United States as she can from England and Wales (the figures are 13,095 to 26,328), knowing, as we know, how greatly is the supply of labour in excess of the demand, is a standing reflection upon the manhood of the Mother Country."

## Types of Fruit Trees.

THE planting season extends all winter, so long as the weather is mild and open. Planters should consider carefully the merits of various classes of trees before they make their final selection. By doing this they may often avoid mistakes which have to many, proved costly in the past. A point frequently forced to the front in various quarters is, that if trees are obtained from a colder district than that in which they are to be planted, they will give better results than when brought from a warm to a slightly colder district. I have never been able to find that this assertion has any foundation in fact, and after having watched the behaviour of trees obtained from various sources closely for some years, I am decidedly of opinion that this old idea is an absolute fallacy. The vital point is to get well grown trees with plenty of fibrous roots, and top growths free from insects or diseases, and correctly named; then, no matter from what district they are obtained, if planted under suitable conditions, good results will inevitably follow.

Another fallacy which needs combating is the idea that the planting of big trees necessarily means quick returns in the shape of fruit. There is at the present time a great demand, among persons not well versed in fruit culture, for trees with long, strong shoots, which have been quickly grown. Nurserymen must, of course, cater for this class of customers, and they do so by transplanting the trees intended for them less often than those which are disposed of to men who know what good trees should be like. The big, quickly grown, untransplanted trees have but few fibrous roots, and when they are set out in their permanent positions they necessarily take a long time to get thoroughly established. The

READERS are requested to send notices of Gardening Appointments or Notes of Horticultural Interest, intimations of Meetings, Queries, and all Articles for Publication, officially to "THE EDITOR," at 12, Mitre Court Chambers, Fleet Street, London, E.C., and to no other person and to no other address.

ideal tree is one which has plenty of fibrous roots and a moderately large head, with short-jointed, well-ripened wood. A tree with a small head and plenty of good roots is greatly to be preferred to one having a big top and a few long, strong roots.

If the right type of tree was more generally planted, there would be fewer discussions as to whether it is better to cut the shoots hard back the first year after planting, or allow them to go unshortened for a year. The badly rooted tree cannot make much progress the first year, whether it is cut back or not. For planting in private gardens, where the soil is rich, trees three or four years old have their advantages—always provided they have been shortened annually to get sturdy branches, and have also been transplanted the previous year. Such trees, under good management, begin to bear quickly, and in dry seasons means can generally be found to water them at critical times. For planting on a large scale for market purposes, a different type of tree is, however, necessary, as the soil is usually less rich, and the close attention given in private gardens cannot be practised. Trees two or three years old are therefore the favourites with the market men, because they become quickly established, and can be formed by pruning into the desired shape.

Standards are, of course, the best types for planting on grass, and large quantities are needed annually for that purpose, but it is somewhat surprising that this form of tree is still very often largely planted on cultivated land. Presumably the reason is that standards leave a greater space for small fruits between than bushes do; but the bush form for Apple trees has so many advantages that I believe the time will come (and the sooner the better) when the bulk of these fruits seen on our markets will be grown on bush trees and worked on the Broad-leaved Paradise stock. The more I see of trees on this stock, the better I like them. It seems to be usual to recommend Pears to be grown as pyramids: the reason often advanced is that a tree of that form is so designed as to catch the greatest number of the sun's rays. That point, I believe, no one will dispute, but the weak point about a true pyramidal shaped tree is that, in order to keep it shapely, the strong-growing branches near the top have to be pruned hard, and therefore send out hosts of other strong shoots. And how often do we see beautifully shaped trees which seldom produce fruit near the top because of this hard cutting back; yet it is at the top of a tree that some of the best fruits should be grown. I am strongly in favour of the open bush, both for Apples and Pears. After the central leader has reached a height of from two to three feet, remove it and leave the centre of the tree open. The result is that, as the main branches all spring from the central stem within a couple of feet of each other, they are pretty equal in vigour. A well-balanced head is thus obtained, and the fruit, having full exposure, colours well.

With regard to trained trees for covering walls quickly, the various forms of cordons are making headway, and deservedly so; for by their use several years are gained in covering a moderately high wall. The reason for this is that with a cordon it is never necessary to cut back a leading shoot to originate an additional branch; hence their advantage over other forms of trained trees. While writing of cordons, I am not referring to single cordons only. I have great faith also in the two, three, and six branched cordons. In each case the number of branches required have already been originated when the trees are purchased. The leaders can, therefore, be trained right away to fill their allotted space quickly, the only shortening necessary being, when through any cause, they grow too weakly. There is a fine opportunity on our English markets for growers of good, clean samples of Pears, and by growing cordons on walls and fences a quick return can be secured. This year we must, of course, write against the Pear crop the ugly word "failure," but we shall undoubtedly have good times for Pears again.

In regard to planting of all descriptions—if the rain will only keep off for a time to allow the surface to dry—the soil will soon be in a better condition for such work than it has been for years, because the subsoil, having been thoroughly moistened, will hold in reserve a supply of moisture for the roots to draw upon in times of need. I am, of course, referring to soil which has good natural drainage, or has been drained by artificial means. Water-logged land is outside the province of the fruit grower.—H. D.

#### *Oncidium pumilum.*

This very distinctive and interesting, though not particularly attractive Orchid, is not found in many collections. All the same, it is fairly well known, and those who do cultivate it have no difficulty, so far as we know, in getting it to flower. The inflorescence, as may be seen from the illustration, forms a dense scape, and the colour is yellow, the sepals and petals, moreover, being spotted with brown. The leaves are 2in to 4in high, stiff, erect, and without pseudo-bulbs. They are nicely marbled. The plant is a native of Brazil, and requires an intermediate-house temperature.

#### *Cypripedium insigne* at Ugbrook Park.

Growing in a cool house in Ugbrook Park Gardens, I recently saw one of the best batches of this Orchid I have come across. It is not that the plants were of huge size, but it was the freedom with which they were flowering in exceptionally small pots that impressed me. Plants furnished with abundant leafage, and carrying from six to eight full-sized blossoms in 3in pots, I thought were deserving of comment. Such material cannot fail to be extremely useful for room decoration.—E. M.

#### The Week's Cultural Notes.

The genus *Lycaste* has much to recommend it, the plants being extremely free flowering and very handsome. The popular *L. Skinneri* will by now have finished its growth, and the flower buds will soon be appearing about the base of the bulbs. Although less water will now be needed, the roots must not be entirely dried up, or the plants will suffer. The more roots a specimen has, and the better it is established, the easier it is to cater for it, as a mistake either way in watering does little harm. It is the badly-rooted plant that suffers most, because if overwatered the roots are not able to take it up, while drought still further weakens the pseudo-bulbs, that owing to the scarcity of roots are weak to begin with.

Although weaker in growth than the preceding, those charming little species *L. cruenta* and *L. aromatica*, are easily kept in health. The enormous number of flowers produced by even very small plants constitute a great strain upon them, and at no time must the roots be really dry, or the pseudo-bulbs will suffer. Now is the very quietest time in their year's work, but even now they need a little sustenance, *L. lanipes*, *L. Barringtoniae*, and *L. Deppei* all need similar treatment, the last named being the weakest grower.

When *Cattleya Bowringiana* has been grown warm the flowers will by now be getting past, and any plants that are needing attention at the roots must have it without delay, or the young tips will be injured in the process. It is an operation requiring the greatest care to repot plants of this description after they have started rooting, and it must not under any consideration be left to careless or unskilful assistants. Before placing any of the new compost a little damp sphagnum moss must be gently wound about the base of the last-formed bulbs, where the roots are emitted, and while firmly fixing the rest of the compost no pressure must be brought on this. It is worthy of note in passing that not only is this beautiful plant more healthy in a warm house, but the earlier date at which it flowers under these conditions renders it practically safer from the fog. The autumn flowering *C. labiata*, too, may require attention, but here individuals will vary greatly, some commencing to root before the flowers are past, others remaining some time after. Plants of this and others that show no disposition to root should be kept well on the dry side. *C. Dowiana aurea*, for instance, kept moist often refuses to root, but a week or two of dry treatment is conducive of activity.—H. R. R.

#### Orchids from the "Harefield Hall" Collection.

From the catalogue of the two days' sale (November 4 and 5) of duplicate Orchids, the property of Elijah Ashworth, Esq., Harefield Hall, Wilmslow, Cheshire, we take the following paragraphs:—

##### ODONTOGLOSSUM "STAR OF HEATON."

A beautiful and distinct *Odonto*, with full flowers, sepals and petals broad, ground colour white, petals and lip blotched with a rich brown colour (of  $\frac{3}{8}$ th of an inch area), marked with a number of small spots of a blue tinge round the edges of the sepals, petals also blotched with brown spots ( $\frac{1}{8}$ th of an inch). From Messrs. Charlesworth and Co.

##### DENDROBIUM WILLIAMSIANUM.

A fine plant. Last year's bulb measured 26in, and the two leading bulbs 12 $\frac{1}{2}$ in, well leaved. A distinct and handsome species from New Guinea; it has large flowers with pure white

sepals and petals, and scooped-shaped lip of a deep magenta purple. Only six plants were found originally, and of these only one arrived in a living state, and the plant now offered is said to be the only one left. For further particulars of this rare and beautiful *Dendrobe* see "Orchid Album," Vol. 6, plate 252. Received a F.C.C. at the R.H.S. Bought from the "Selwood" collection, but originally came from Messrs. B. S. Williams and Son.

#### ODONTOGLOSSUM CRISPUM ASHWORTHIANUM.

This superb *Odontoglossum* is remarkable for its deep rosy-purple colour and its large, almost unbroken blotches on its segments, which extend almost to the edge of its sepals and to within about 1-32nd of an inch from the edge of its petals. The whole flower is so densely coloured, that it may be justly described as a self-coloured crispum, the colour running through to the back of the flower. The flower is large, sepals and petals broad, with toothed or crisped margins; the lip is large and well shaped, white, blotched with a lighter colour than its segments. It is in the same section as *O. crispum* Baroness Schröder, and *O. crispum* Franz Masreel. Received an unanimous F.C.C. at the R.H.S., April 18, 1899, where it was exhibited, bearing a fine spike of six flowers, which has been faithfully painted by "Macfarlane." Illustrated in *Lindenia*, Part 64-65, May-June, 1896.

## The Art of Decorating.

The following appeared in the "American Florist": It is a very exasperating circumstance when a florist, employed to execute a piece of decorating, is compelled to discard a wealth of beautiful and appropriate material that he may have at hand and could make use of with profit as well as credit, and to ransack the market for something less appropriate, just because the madam has set her mind upon it; but this is an experience that every florist must repeatedly undergo, for crotchety and arbitrary people are found everywhere, and especially among the opulent classes, with whom a florist's services are most in demand. On the other hand, we have occasionally the customer who comes with implicit confidence in our ability to serve him well, and who unhesitatingly places the hall or suite of apartments at our disposal, with full liberty to go ahead and make a nice job of it. In such a case it is a fortunate responsibility that devolves upon the florist, and he should be able to fulfil his commission in such a manner that it shall leave no opportunity for criticism on the part of people of refined taste.

These are the occasions which mean the upbuilding or the downfall of a florist's prestige. If he does not rise to the occasion, and is not capable of taking full advantage of his opportunity, or is negligent in it, then he proves himself unfit for the position he assumes, and he need feel no surprise when he sees a competitor outstripping him in his own territory. The character of the apartments to be adorned, the known tastes of the hosts or their guests, the nature of the occasion, all are important factors influencing the decorator in the choice of the material used and the manner of its application. Yet, with all these and other minor limitations, it remains true that the man who understands his business can adapt himself to the times and circumstances as to the material at hand, and make prominent use of that most easily available, and still score a pronounced success in his work; for consistency and harmony, not the material used, are the potential characteristics of the work of the true artist. Given the same room, under identical conditions, two or more

independent decorators might, and probably would, carry out the work according to different designs and in a very different manner, and one or the other might best please the fancy of different persons, so that the question of merit might be variously decided; yet each might be equally correct from an artistic standpoint. Then, conceding equal artistic merit to each, keeping qualities being also equal, he is the best master of his art who has achieved the result with the least expenditure.—W. J. S.

## Notes on Bulbous Plants.

### New Liliun, Mrs T. Roosevelt.

The "Mrs. Theodore Roosevelt" is the name of a new Lily which has been hybridised by Joseph Tailby, of Wellesley, and received a silver medal from the Massachusetts Horticultural Society as being the finest novelty in the way of decorative plants ever hybridised in the United States. The new Lily (reports the "Globe") is about 2ft high, and resembles a sub-tropical plant, having large, dark green, silvery spotted leaves, and tall primrose yellow spathes. It is strong and hardy, lives out of doors, and is able to reproduce itself from seed.

### Hyacinths for Baskets.

Our rather stiff friend, the Hyacinth, can be made useful in baskets. We tried it last winter for the first time, and I was perfectly delighted with the result. Instead of growing the Hyacinth in the old conventional way, it can now be made to curve its spike in a most graceful manner if arranged to grow in form of a hanging basket. The method of culture is so simple that even the most inexperienced amateur can easily manage it. First make up a ball of fresh sphagnum moss about 8in in diameter, into which insert the Hyacinth bulbs all round, binding them in with string and more moss so that only their points are visible. Then run a wire through by which the ball can be suspended in greenhouse or sitting-room window. No more attention will be required except to dip the ball in water about once a fortnight. Such hanging baskets can be effectively made with named or bedding Hyacinths, and also with Roman

Hyacinths. The open wirework baskets which are sold can be filled in the same way. The spikes, the points of which are turned downwards, try, of course, to turn to the light and curve upward more and more, so that when the flowers are in bloom, the lower spikes, growing from the bottom and the sides of the ball, all hold their flowers up to the light. You cannot imagine how pretty these balls are, both when the flowers are all of the same colour, in graduated shades, or mixed tints.—B.

### Brodiaëas.

The genus *Brodiaëa* contains over twenty-three hardy species. The flowers, which for the most part are produced after the leaves and supported on slender stalks, are white or blue. Being easily cultivated, many of them are worthy of a place in a flower border. *B. uniflora* is a spring blooming species, and is perhaps the best known. But such species as *capitata* and *grandiflora*, both with blue forms, and *B. lactea*, a milky white

form, may also be added. *B. coccinea* is now included in the genus *Brevoortia*, under the name of *Ida Maïa*; whilst *volubilis*, a curious and handsome plant, whose stalk assumes a spiral form, climbing 10ft to 15ft, is now called *Stropholirion californicum*. With the exception of *Milla biflora*, all the species of *Milla* are now consigned to the genus *Brodiaëa*. *M. biflora* is a beautiful half-hardy Mexican species, bearing pure white star-shaped flowers of waxy texture.—D. McG.

*Oncidium pumilum.*

### Rose Analysis.

(*Rosette de la Legion d'Honneur.*)

I am only one of thousands who have read with pleasure, and, I hope, profit, Mr. Mawley's Rose analysis. But there is one Rose—a very startling absentee, in my opinion—that I can not find in the list. I refer to Rosette de la Legion d'Honneur. Of course it belongs to the class of Garden or Decorative Roses, and yet it is conspicuous by its absence. I begin to think I am absolutely wrong in my estimate of this Rose, but it is one that has a very deep hold on my affection. I would be very glad to hear the opinion of "W. R. Raillam," or some other really competent rosarian, as to its merits and demerits.—H. B. B., Hythe.

### Large Potatoes.

In reply to the question put under this heading by "W. B., Kent," in the Journal of November 12, I have to say that in the year 1862, in Archerfield Gardens, there was raised by me from a portion of a south border a crop of Walker's Regent Potato that was considered by everybody to be unusually heavy and remarkable. One Potato turned the scale at 3½lbs, and twenty-four weighed 44lbs. Mr. Hunter, late of Lambton Castle Gardens, can corroborate this, as he was the person who, with another, did the work of lifting and weighing the crop, which was quite as remarkable for its general bulk as were the individual tubers referred to above. In 1896, at Drumlanrig Gardens, there were raised from one row in one of the quarters, scores of tubers over 2lbs in weight. From one set the weight of produce was 1 stone 3lbs, and few of the tubers yielded less than a stone. I carried out many experiments in Potato culture, all of which prove that to plant very small sets resulted in poor results, and that medium-sized tubers, planted whole, gave the most desirable results, both as to the general weight of crops and size of individual tubers for cooking. The secret of heavy tubers I found to be in planting the largest possible sets whole, giving ample room, and allowing not more than two growths from each. It may be said that such heavy tubers are not desirable. That is true. Still, the last order I got from my employer at Archerfield before he left for the season was to be sure and grow him more of "those large Potatoes" as they were so splendid, baked in their jackets.—D. THOMSON.

### Point Judging.

In reading Mr. Brotherston's attack on this method of awarding prizes (page 411), one cannot help wondering if the reactionary times in which we live have not unduly influenced his judgment. That judging by points has had a fair trial most people are perfectly well aware, and many of us are fully cognisant of the haphazard methods it was intended to displace. Its supporters have every reason to be satisfied with the results obtained from its application in numberless instances; and if it is not perfect, what then? In view of the benefits derived from its use, is Mr. Brotherston prepared to discard the system, and revert to the older method? I imagine not! It must be admitted that there have been times when judges would have been pleased that their names should have been sunk in oblivion when published in connection with awarded points. Have we not here one of the strongest reasons in support of "point judging"? Surely the publication of the number of points with the names of the judges should tend, save in the case of the most hardened sinners, to cause those worthies to be more than usually careful in their decision. Too much stress is also laid on the variability of the standard of judgment; and when the writer of the article asserts that the numbers provided as a standard are, as a matter of fact, no value whatever, he steps at once over the border line of prudence and care of statement. These numbers, to some judges at least, are not employed to give self opinion expression; that they could form a standard inflexible and unchanging is much to be desired, but more than can reasonably be expected. Judges are not automatic machines, and though the vagaries of some few may be deplored, the standard of judgment with the best of them is maintained on a fairly even keel, and the fluctuations and variations which Mr. Brotherston would have us believe exist to a great extent, are only existent to a very small degree; especially is this the case with those who are in constant and continuous practice.

I am tempted to ask Mr. Brotherston what, apart from the

"point judging" method, would he employ in awarding the prizes over a wide area of gardens and allotments? It is obvious to the simplest minds that where competing patches of land lie half a mile apart it is not by any means easy to carry their comparative merits in one's mind's eye; particularly is this the case when there are many competing, and the competition close. If pointing is not satisfactory under such circumstances, it is scarcely likely that decision by view alone would redound to the credit of the judges. "Of pointing, as a means of aiding judges to arrive at a correct decision in cases where the competition is close, I have nothing but praise," says Mr. B. As this was the strongest point urged in its favour by supporters at the very outset of its inception, I fail to see the value of the condemnatory remarks preceding its utterance, or why, in conclusion, it is stated that its public and compulsory applications should be of doubtful benefit.—JOHN WRIGHT, Newent.

### Criticism from Sheffield.

Referring to the show of the Sheffield Chrysanthemum Society, a correspondent writes: "Unfortunately for the society, it is handicapped by a very heavy rent—between £50 and £60 for the two days; while the City Council has a large hall standing idle, and has declined to let it to the society on the ground that 'they hope to let it permanently.' This is the hall that was for very many years the home of the society, but which they had to leave on its coming into the hands of the City Council. Verily the 'Markets Committee,' like the 'Parks Committee' of Sheffield (save the mark!), are antagonistic to all that tends to the education and elevation of the people by floriculture. In probably no town or city do the authorities hamper such societies so much as in Sheffield." Pro bono publico?

### A Gardeners' Association.

There is just now a movement on foot to establish a Head Gardeners' Association for the United Kingdom. The proposals that have led to the movement originated with one or two earnest and very able gardeners, men having ideas and endowed with a great desire to raise the gardener's status. How far the suggestions which have emanated from these gardeners may have proved practicable, or to whatever extent they may find support, has to be seen. Without doubt, the suggestions referred to originated from the recent gardeners' dinner, a function which brought so many of the craft together from all parts of the kingdom, but all too briefly, and in the end, to little effect. But the promoters of that gathering had no intentions or aims beyond those so successfully realised; whilst some who were present have wished that those intentions had been wider in aim, and had included the formation of some permanent organisation for gardeners, on the lines of the proposals now being made.

When the final meeting of the Dinner Committee was held for the purpose of receiving the statement of accounts and disposing of the balance, a letter from an eminent gardener was read, inviting the Committee before it was disbanded, to consider the desirability of forming for the United Kingdom an association of head gardeners for certain specific objects. The Committee, consisting as it did of head gardeners, unanimously agreed to the request, and I am authorised to convene a further meeting of that body at the Horticultural Club, by kind permission, on December 15 next, at two p.m., when any head gardener who may desire to take part in the deliberations and assist in the organisation of a Gardeners' Association, would be heartily welcomed. It would, however, be well that such persons should communicate to me that desire previously. The meeting will, of course, be private, because no good purpose would be served in publishing the discussion. Should the proposals take definite form, then, of course, the fullest publicity would be invited. Primarily, the aims of the proposers of the organisation are exclusive to gardeners, although, as one suggests, members of the horticultural trade or amateurs might be honorary members.

A few of the objects it is desired the proposed association should aim at is, the raising of the status of the gardener to a position superior to that of a mere domestic servant, and more on a footing of equality with those employés on an estate who are recognised superior heads of departments. The gardener is, as a rule, a man of bright intelligence and of wide knowledge, and, intellectually, is fully the equal of the agent, steward, or bailiff. Then it is thought that the education and training of under gardeners is too often far from being all that can be desired. It is too haphazard, and not sufficiently general and practical. A strong association might do much, especially through its members, to aid in that direction. Again, it is thought that a central organisation might be able to do much in aiding members to secure situations, a list of capable men seeking such being kept for reference. Each member who may learn of any vacancy being required to at once communicate such information to the central body. These are but a few of the ideas which animate the pro-

posers. No doubt many gardeners who are readers of the *Journal of Horticulture* have ideas in relation to such an organisation as is proposed. If they cannot come to the meeting on December 15, I wish they would kindly send me their ideas, as, when the meeting is held, the more reasons offered for the formation of a gardeners' association, the more likely is it that such a body may take shape.—A. DEAN, 62, Richmond Road, Kingston-on-Thames.

### Apple, Annie Elizabeth.

In answer to E. D., page 442, I would say that with us at Crawley it is not a very certain cropper, but the fruits are undoubtedly solid, handsome, and very long keeping. It would be useful to have further reports about Annie Elizabeth.—C. S.

### Violet, Lady Clifford.

In the last issue of the *Journal* I note a mention of this new, single-flowered Violet. Early in November I saw the batch of plants growing and flowering in the open in Lord Clifford's garden at Ugbrook Park, near Cludleigh. I was much impressed with the variety, and Mr. Abraham, the gardener, informed me how much more freely it flowers than Princess of Wales. It is certainly distinct from that variety in colour, being distinctly shaded with purple, and has a more clearly defined white eye. The flower is shapely, borne on stiff stems fully 10in long. For early autumn outdoor flowering this Violet should be valuable as well as for frame culture.—M. X.

### Protection for Fruit Trees.

It is time to think if valuable fruit trees in the open can be protected against frost during the blossoming period; and what is the best means of doing it. I remember last year I had a profusion of promising bloom on Coe's Golden Drop, Transparent Gage, Denniston's Superb, Magnum Bonum, and Belle Louvain Plums, young pyramidal trees, and one morning the blossoms were quite blackened. This was owing to a quick shifting of the wind to the north, with a clearing, cloudless sky. I should like to know, from anyone who may have tried it, would thick meshed netting, tiffany, or any other material that might have been spread over those trees, have protected them from that killing frost? A week's or ten days' covering, over the critical flowering period, would not seriously injure the foliage, even though there was a partial exclusion of sun and light. It is plain our fruit trees must be protected if we are not to suffer the loss of the crops year after year. Would not Messrs. Rivers, Bunyard, or other large growers of extensive experience, deeply interested in the success of fruit culture, and in the realisation of the hopes of their clients, still further enlighten us? I can easily protect my wall trees, but it is different with Cherries, Pears, Plums, Apricots, or Peaches grown as bushes in the open garden. Successful culture is easy in favourable seasons, at least in the South of Ireland; but growers should be prepared for the worst, and take precautions accordingly.—W. J. MURPHY, Clonmel.

### The Autumn Flower Trade.

The "Westminster Gazette" says: "Seldom has the autumn flower trade opened with such a varied supply of flowers as has been on show this year. In the wholesale markets are to be seen some very pretty novelties. Amongst them are Orange trees in pots in fruit, costing from 3s. to 5s. each, and along side of them Orange blossoms, worth from 1s. to 2s 6d. a spray. Scotch Heather has met a good reception, selling from 6s. to 12s. a dozen bunches. The white flowers are exceedingly delicate, and contrast nicely with the feathery sprays of Acacia, with their yellow, pollen-like bloom, from the South of France. Soleil d'Or Narcissus has made its appearance again, and the dealers are getting from 3s. to 6s. a dozen bunches for it. The Narcissus trade will be unusually extensive this year. The Orchid more than maintains its position as a commercial flower. We noticed some exquisite blooms of *Odontoglossum crispum*, priced from 3s. to 4s. a dozen wholesale. Lily of the Valley is making high prices, specials commanding from 15s. to 18s. a dozen bunches. Chrysanthemums are worth from 12s. to 36s. a dozen bunches. In pots the plants secure from 6s. to 36s. a dozen. *Lilium lancifolium* in pots made from 18s. to 40s. a dozen. Orchids in bloom from 2s. 6d. to 21s. a pot; whilst fine, free-flowering Roses sell from 6s. to 20s. a dozen pots. Hydrangeas and Cape Heaths are high priced; values here range from 12s. to 18s. a dozen pots. Roses are cheap at 1s. and 2s. a dozen buds, and market bunches of Wallflowers can be had from 2s. 6d. to 8s. a dozen."

## The Dublin Naturalists' Field Club.

The nineteenth winter session of the club was inaugurated on November 3 with a conversation in the house of the Royal Irish Academy, Dawson Street, Dublin. It was a pleasant, informal but instructive gathering. "Just tea and talk, and tailed coats optional," as the genial vice-president said in his kind invitation, otherwise the solitary member of the common gardener species who went in under his wing carrying a mysterious paper bag, would hardly have ventured where scientific professors and learned ladies forgathered galore. On that particular day a lively sample of the English snake had been captured in the College garden, where, thanks to our patron saint, they are rare, and that was the mystery of the paper bag which had his (or her) snake-ship wriggled out of, en route, whilst in charge of its bearer in the crowded tram car, would probably have ended its tale, and this one, too. However, it was safely staged in its glass jar amongst the many interesting exhibits of Irish and exotic flora and fauna, and finally sent to the "Zoo." The vice-president's paper on "Common Things," which he read to an ultra attentive audience was short, pithy, and to the point; Mr. Burbidge exhorting the younger members of the club to avoid the mistaken ambition of seeking great discoveries in their initial researches, and to note the beauty and interest pertaining to the common things around them. With the aid of some well-manipulated lantern slides, the lecturer further showed the natural instinct inherent in the bird world to concealment at nesting-time, as well as Nature's extraneous helps to the same end. The wonders of the microscope were well exemplified by instruments and specimens on the tables about the rooms, and many were delighted with an exposition by Mr. Gunn, who, in showing a skin section of the seed of *Collomia coccinea*, which, under the microscope, looked like a piece of rough bark, touched it with water, when innumerable spiral springs were seen to shoot out in all directions. This gentleman also showed a novelty in the way of seeds of *Anthoxanthum* (Sweet Vernal Grass) placed on a heated cardboard box lid, which immediately hopped, skipped, and jumped in a manner that Mr. Walter Rothschild's fleas might have envied in their liveliest moments. Such is animated nature in the great kingdom of silent life. A small group of interesting subjects from the plant wealth of Glasnevin was contributed by Mr. F. W. Moore, including various *Sarracenias*, the elegant *Trichinium Manglesi*, too seldom seen in private gardens. Very noticeable in this group were plants of *Mammillaria pusilla*, a dwarf Cactus with elongated coral-like berries; *Gonioscypha eucomoides*, with Arum-shaped leaf and curiously dull inflorescence; a good potful of the Australian Nardoo plant, and the distinct and graceful *Pilea spruciana*. More tea and talk wound up an evening so pleasantly instructive that the gardener-visitor cannot but heartily wish all success to the Dublin Naturalists' Field Club, whose members in their unobtrusive studies "Trace in Nature's most minute design the signature and stamp of power Divine."—K.

## Water and Bog Plants.

Mr. Townsend, Sandhurst Lodge Gardens, recently read a paper on "Water and Bog Plants" before the Reading gardeners. The lecturer has made a study of these plants, and a visit to the gardens under his care is always a source of pleasure and delight. The first portion of the paper was devoted to the *Nymphaea*, which, of course, forms the principal feature of the water garden. It was pointed out that a fine Water Lily can be grown in a tub or earthenware pan. This should be sunk in the ground in any sunny position, put in 6in of good garden soil, plant your Lily, and fill with water. Make the water overflow a little about twice a week with rain water or water from a well that has previously stood in the sun for a few hours. Ponds with cement bottoms were dealt with, but the most suitable position for a water garden is where there is a small spring in a sheltered position in the full sun, or one that can be made so by planting flowering shrubs and trees for shelter and effect. Varieties were then given, and the depth of water most suitable to flower them freely. The collection at Sandhurst includes all the leading varieties, and too numerous to mention here. Other plants touched upon were *Aponogeton distachyon*, *Hottonia palustris*, *Anagallis*, *Villarsia nymphaeoides*, *Ranunculus aquatilis*, *Caltha palustris*, *Pontederia cordata*, *Sagittarias*, *Cyperus*, *Mimuli*, *Calthas*, *Iris Kämpferi*, *Lobelia cardinalis*, *Gunnera manicata*, herbaceous *Spireas*, *Senecio japonica*, Daffodils, and Wood Anemones. The lecture was made doubly interesting by a series of lantern slides reproduced from photographs taken by Mr. Townsend himself. A good and profitable discussion followed, in which Messrs. Judd, Lever, Neve, Hinton, Alexander, Durfitt, E. Dore, D. Dore, Fry, Herridge, Prince, and Stanton took part. A hearty vote of thanks was accorded Mr. Townsend for the enjoyable evening he had afforded the members.

### Apple, Middle Green.

Fruit, medium size, two inches high and the same in width; round, even, except for a characteristic rise or tiny hump on one side next the eye; skin smooth, rich greenish yellow—a bright, beautiful colour—prettily flaked and mottled with crimson on the sunny side, the mottling giving it a russety shade on this side. Eye open, with reflexed segments, set in a moderately deep, slightly furrowed basin. Stamens marginal; tube short, funnel-shaped. Stalk half an inch long, nearly straight, stout, and covered with greyish felt. It is set in a deep round cavity. Flesh yellowish-white, firm, very juicy, rich and sugary.

An excellent dessert Apple of first-rate quality. Mr. Seden, manager to Messrs. J. Veitch and Sons, Limited, at Langley, says of it: "The tree has a good habit, is robust, and a good bearer."

### Strawberries in Pots.

All plants for early forcing should be placed in frames, with a view to protect them from heavy rains and snow. Severe frost does the plants no good, and often harm, by destroying the tender fibrous roots, while heavy rains and snow often cause the drainage to become much choked. In frames, and plunged to the rims of the pots, the plants are quite safe, only take care not to allow any to become and remain dry at the roots, to use the lights only when heavy rains prevail, and then with them tilted at the back, and closed when snow and frost occurs, otherwise drawing off the lights.

If protection by mats is given in severe weather, the plants can be removed at any time as required for forcing. One of the commonest and worst practices is to pile the pots, plant outward, in a sort of half-cone against a wall, packing them in sawdust or soil; and the consequence is they get frozen through, and the roots injured, whilst not a few suffer from drought, as they are practically unavailable for watering. A greater mistake is made in placing the plants in borders in a Peach house with open ventilators, where the currents of air, being constant and excessive, provoke evaporation that simply wastes the energies of the plants, and mostly destroys the roots at the sides of the pots. It is a better plan to stand the pots on a foundation of ashes in a sheltered position, and surround them with ashes level with the rim of the pots, affording them a slight covering of straw or bracken in severe

Apple, Middle Green. A.M. October 13.

weather. This answers very well for midseason and late forcing plants, they being removable at any time, and take no harm, only if frozen the plants must be thawed in a house not much above freezing point.

Where there is the convenience of a Strawberry house, and the fruit is required early, say in late February or early in March, a batch of plants may be introduced at the latter part of November or beginning of December, placing them on shelves near the glass, and only employing fire to exclude frost at night, and to maintain a temperature of 50deg by day, at and

above which ventilate freely. The plants forming this batch should be the earliest matured, with well formed crowns, and of the most approved early forcing varieties, than which we have not found better than La Grosse Sucrée, Royal Sovereign, and Vicomtesse Hericart de Thury. The old Black Prince is earlier and forces readily, but is very liable to mildew, which often ruins the crop.

Where there is convenience, and the crop is required very early, or when the plants are backward, it is a great aid in early forcing to afford the plants the benefit of a slight warmth at the roots by making up a bed of leaves about 2ft in height, placing the plants in a frame or house upon it, packing the space between the pots with damp leaves. The bottom heat at the base of the pots should be 65deg, the top being kept cool, 50deg not being exceeded; and when mild draw off the lights. This will promote activity at the roots, and the crowns will push little or nothing; yet the plants, after a month of this treatment—the bed then being cool, or the pots withdrawn in preparation for removal to a vinery just being started—will go right away without having the leaves drawn or the trusses weakened by being placed direct from cool quarters in a house almost warm enough when started for the Strawberry when in flower. In fact, plants with well developed crowns and abundant roots do not always succeed in a vinery, because they are brought into flower too rapidly; but treated in the manner advised, excellent fruit of La Grosse Sucrée may be had in March from a vinery started at the new year.—G. A.

### Figs: Earliest Trees in Pots.

To have ripe fruit at the end of April or early in May the trees should be started in December, and they must be of the early varieties. After trying most, I find Early Violet, St. John's, and Brown Turkey reliable in the first crops, and giving a succession of fruit. Dress the trees with an approved insecticide, and stand them on loose brickwork pillars, so that they may not settle with the fermenting materials, which being placed in the pit and brought up about the pots will afford gentle warmth and genial moisture, but the heat about the pots must not exceed 65deg until the trees are fairly in growth.

The top heat may be kept at 50deg to 55deg at night and 65deg by day, the trees and house being damped in the morning of fine days, and again in the afternoon, but it must be done sufficiently early to allow the trees to become fairly dry before night. Water must be given at the roots to render the soil evenly moist, supplying it at the same temperature as that of the heat about the pots, but avoid overwatering or a wet condition of the soil, as that neither favours root formation nor a steady development. Also avoid a close moist atmosphere. The moisture arising from the fermenting material, with an occasional damping of the paths and walls, will be sufficient in dull weather.

### EARLY FORCED PLANTED OUT TREES.

The earliest house should be closed in December to have ripe Figs in May. Where, however, the earliest Figs are obtained from trees in pots, starting the trees in borders may be deferred until the New Year, so as to afford a succession. Planted-out trees, even with the roots confined, as they should be for early forcing in narrow borders, will not ripen the fruit so early as trees in pots with the aid of bottom heat; hence, if started at the same time, they will afford a close succession to that from trees in pots. The trees having been pruned and dressed with an insecticide, the house thoroughly cleansed, and the border top-dressed, attention may be given to the moisture of the border. Assuming the soil has become dry, apply water in a tepid state at the roots at frequent intervals, until the soil is thoroughly moistened through to the drainage, but not made sodden by over-supplies. In the matter of temperature, proceed as for the trees in pots.

### St. Louis World's Fair.

Under the classification of pomology, its appliances, methods, and products, there will be installed in the Horticulture Palace of the Universal Exposition of St. Louis, 1904, displays as follows:

#### POMOLOGY.

Pomaceous and stone fruits: Apples, pears, quinces, cherries, plums, peaches, apricots, nectarines, &c.  
Citrus fruits: Oranges, lemons, limes, shaddocks, pomeloes, &c.  
Tropical and sub-tropical fruits: Pineapples, bananas, guave, mangoes, tamarinds, figs, olives, sapodillas, &c.  
Small fruits: Strawberries, raspberries, blackberries, dewberries, gooseberries, currants, &c.  
Nuts: Almonds, chestnuts, filberts, hickorynuts, walnuts, &c.  
Casts and models of fruit in wax, plaster, &c.

#### ARBORICULTURE.

Fruit trees and methods of propagating, planting, growing, training, pruning, &c.

#### APPLIANCES AND METHODS OF POMOLOGY.

Pools for nurserymen: spades, picks, hoes. Tools for pruning, grafting, gathering, packing.

### Chrysanthemum Mr. J. P. Bryce.

I must confess surprise when I saw the above variety obtain a first-class certificate at the hands of the Floral Committee of the N.C.S. as an incurved variety. Personally, I thought it belonged purely to the Japanese incurving section. The florets are broad, and incurve much too loosely to justify its inclusion in the section where placed. Until such an authoritative body as the Floral Committee of the N.C.S. are more stringent in their awards, we cannot hope for a higher standard in this much-degenerating section. This is not the only instance either where certificates have been misapplied in this section. Was there ever a more glaring error than to place President Bevan in the list of incurved? This season has well served already to prove how absurd such classification is. In several instances I have noted this variety in such a condition as to fit it thoroughly to take its place as an incurved Japanese. Instead of this we find it alongside of C. H. Curtis! Never was a comparison so odious when thus placed.—AN ONLOOKER.

### Chrysanthemums and their Names.

Your frequent correspondent "W. S." has some notes under this head on page 420. The same title will serve me, though my notes bring forward "names" in another aspect to that considered by the above-named. We all know that the daily and general newspapers usually make remarkable errors when plant names are dealt with. Do the reporters not write clearly? Are the names wrongly spelt on the labels they write from, or are they illegible? Both faults, alas! are too common, and thus the grower who labels is to blame, and not the newspaper reporter. However the following names originated I do not pretend to explain (they are from the "Hastings Times"), but they will amuse some of your readers, without a doubt. The paragraph conveys a notice of the Chrysanthemums in Alexandra Park, Hastings. Thus the rendering: "Mrs. G. Harmer Paine, Rayon Ante, Mrs. Coombe, Mrs. Harry Emerton, Mrs. Jas. Besant, Soliel de October, Col. W. B. Smith, Madame Chervant, Jane Molyneux, Princess Alice de Monaco, Sœur de Pettie Annie, F. Phœbus, Mrs. C. S. A. Wood, the Princess M. Louie Renny, N. G. Newitt." It is only fair to add that twenty-two which were given correctly are here omitted.—T. E.

### At Dewsbury Park, Yorkshire.

Four hundred plants, with two and three blooms each, are grouped in the centre of a span-roofed house. These comprise Japanese, incurved, and a few Anemone flowered varieties. Collectively they make an imposing display, and are remarkable for the fresh and healthy appearance of the plants, and for the bright appearance of the blooms. Around the side stages are arranged 400 of the cream of all sections. These are closely tied-in to supports in the form of a quarter circle, and are a distinctly pleasing feature, well worth imitation. When examined in detail, the high quality of the blooms is very marked, the Japanese being of great depth and highly developed. Incurved blooms are particularly good, especially the "Queen" family, which have that globular build so much desired, but seldom attained in such perfection as here seen.

Anemone-flowering varieties in the leading sorts are in good form, and although not so striking in appearance as their giant relatives, they possess a fascination for many people, including the writer. The best of the new Japanese as seen here are George Lawrence, General Buller, Meynell, Mafeking Hero, Godfrey's Pride, Mrs. F. S. Vallis, Hon. Mrs. A. Acland, Lady Conyers, and John Fraser, the latter remarkably fine, similar in colour and form to Lord Brooke, but vastly superior. It is one of Wells's. Strikingly good amongst the older sorts I noted Elsie Fulton, Australia, Mrs. Cleeve, Mrs. T. A. Compton, Marquis V. Venosta, Matthew Smith, Mrs. Greenfield, N.C.S. Jubilee, all the Vivian Morel family, including the white Mrs. J. Ritson, with such blooms as are seldom seen. Mrs. T. W. Pockett in 6in pots, one bloom to a plant, was fit for a show board in the most select exhibition.

Mr. Daniells is well known in the North of England as a successful grower and judge of the "Autumn Queen," that it is almost superfluous to add that the collection reflects the highest credit on him and his assistants. The people of Dewsbury are justly proud of their annual show of Chrysanthemums in their well-kept park, and none who see it will care to dispute their claim that they have one of the best displays in the North. —R. CRAIGIE, Mirfield.

### Chrysanthemum Show Dates.

It would be well if many societies would follow the lead of the undermentioned in fixing the date of their shows thus early, giving other societies an opportunity of arranging their fixtures so as not to clash with each other, except where absolutely unavoidable. The N.C.S. should set an example to other shows in this detail. Many societies wait until the central body, as it is sometimes termed, announces the date of its shows before they arrange. This early selection of dates should be followed as quickly as possible with the issue of the prize schedule, so that cultivators may have an opportunity of providing fully for the various classes included in an up-to-date schedule. When this latter is not issued until April, May, or June, what wonder then if some classes are but indifferently filled? The following societies have fixed their 1904 shows as follows: Cardiff, November 2, 3; Winchester 9, 10; York Chrysanthemum, November 11, 12, 13.—E. MOLYNEUX.

### Seedling Chrysanthemums at West Hall, Byfleet.

Year by year the difficulty of raising improved varieties of Chrysanthemums becomes greater, but this does not deter Mr. G. Carpenter from giving seedlings considerable attention. This year, or rather from the selected few of last season, he has obtained two which should be heard of when the stock becomes distributed. They are A. C. Stevens and Miss Ellen S. Kerr. The former is light yellow—the shade of Soleil d'Octobre. It is a full, deep, reflexing bloom, of much substance, and very handsome; and what is important too, it has a first-rate habit of growth, very dwarf and sturdy. The latter is a creamy white, and may be compared to a gigantic Nellie Pockett. The habit of this is sturdy, so stout, in fact, as to resist the "rust" in a remarkable manner. Maybe exhibitors do not care so much for the habit of a plant, whether tall or stout, so long as the well-developed blossoms can be had; still, if a variety possesses sturdy foliage, it is a good deal in its favour. Both of the above named sorts should be noted. They will probably be exhibited, and many growers, at least, will be able to see for themselves. One other, named Mrs. F. C. Stoop, a bright pink flower, appeared most promising, but in an undeveloped state as I saw it it is early to judge properly of its merits.—H. Woking.

### A Grand Exhibit at Weybridge.

One of the members of the Weybridge Chrysanthemum Society has presented a really valuable cup in competition, and asks for a dozen Japanese blooms, the winner to take it three times before it becomes his absolute property. It is stipulated also that the winner must be the grower of the flowers. This cup, then, is likely to create rare interest in a neighbourhood that can claim some first-class cultivators. The first winner is Mr. J. Lock, gardener to Sir C. Swinfin-Eady, Oaklands Lodge, Weybridge, with an exhibit that has seldom been equalled. The character of the blooms may be gauged when it is stated that in the back row were specimens of Mrs. F. S. Vallis and Henry Perkins 10in deep, and in the front row grand, deep, well-coloured examples of W. R. Church and Edwin Molyneux. I was anxious to see the plants that had produced the blossoms, and the thing that struck me as being out of the common was the amount of room given to each. Mr. Lock is careful not to grow more than he can manage, and that he has tended well to their wants there is ample illustration. I have seen stronger plants, but not specimens better ripened, thus pointing to the value of plenty of space, especially in a season such as we have passed. Light and air, and a goodly amount of sweet loan for the roots to ramble in will do more in the way of producing handsome Chrysanthemum blooms than fanciful fertilisers.—H. SHOESMITH.

### A Fine Group of Chrysanthemums.

At the recent exhibition of the Guildford Chrysanthemum Society, the first prize group of R. N. Stevens, Esq., Woodham Hall, Woking, was something worthy of more than passing notice. It resulted in winning a valuable cup outright. Mr. A. E. Seabrook, the gardener, staged the best group three times. It has taken five seasons to do it, so that the reward has not been easy to obtain. On this occasion one of the judges stated that he had not seen a better group during the past twenty years, which is the same as saying it was the best, because grouping before that time was quite without note. The wonderful quality of the blooms was the leading feature in this instance, on plants exceedingly dwarf and with foliage free from any fault. It is not too much to state that Mr. Seabrook might have cut blossoms from his group and beaten any that were exhibited in the cut flower stands. A bloom (Guy Hamilton) was selected as the best Japanese of the whole show, and was growing on a plant in a 7in pot. Probably two other specimens were in the running for that award had not this splendid white obtained it. Australia, Princess Alice de Monaco, Mrs. G. Mileham, Miss Alice Byron, E. Molyneux, Hero of Omdurman, Mrs. R. Darby, and Mrs. Greenfield. These were a few of the varieties which seemed especially striking. All, however, were capitally timed, and very fresh and clean.—S.

## NOTES

## NOTICES

**Woolton Gardeners' Society.**

There was a capital attendance of members at the opening meeting of the session held in the Mechanics' Institute, Woolton, on Thursday last, to hear a lecture by Mr. R. Wilson Ker on "Hardy Flowering Shrubs and Trees." The Rev. William Mellor occupied the chair. The lecture was illustrated by about eighty splendid limelight views, many of which were kindly lent by Mr. George Gordon.

**Royal Horticultural Society.**

The next fruit and flower show of the Royal Horticultural Society will be held on Tuesday, November 24, in the Drill Hall, Buckingham Gate, Westminster, 1 to 4 p.m. A lecture on "Pomology as a Study," will be given by Mr. Lewis Castle, F.R.H.S., at 3 o'clock. At a general meeting of the Royal Horticultural Society, held on Tuesday, November 10, forty-five new Fellows were elected, making a total of 1,281 elected since the beginning of the present year.

**Illustrations of Conservatories.**

Again we return to the consideration of winter garden conservatories, and by the kindness of Messrs. Mackenzie and Moncur, Limited, the renowned horticultural builders and heating engineers, of Balcarres Street, Morningside, Edinburgh, we are able to present types of these structures made by them. Good material and thorough workmanship are conspicuous in the undertakings by this firm, and if these essentials are wanting in work of this nature, or in building-construction of any sort, is there either pleasure or utility in them? The conservatory at Philiphaugh, Selkirkshire, is a very fine one, certainly one of the most elaborately finished of any in the kingdom; and the glass at Philiphaugh is all of an up-to-date pattern, and of high quality. An adjacent conservatory of a similar type is that at Farmleigh (co. Dublin), and the study of either of these conveys impressions for the guidance of anyone who may contemplate such additions. If possible, attached conservatories should be distinctly architectural in treatment. As a rule, they are not houses in which to grow plants, but rather as show places.

**Obituary: Mr. Abraham Newell.**

The death of Mr. Abraham Newell, gardener to the late Sir E. Saunders, and later to Lady Saunders, at Fairlawn, Wimbledon Common, took place at Fairlawn on the 11th inst., at the age of 52 years. He had been in weak health for several weeks past, and gradually became worse until he died on the above date. He was for many years a member of the National Chrysanthemum Society, and was an active member of its executive and other committees. He also exhibited at some of its shows, furnishing charming groups of winter-flowering plants. He took an active part in the management of the Wimbledon Horticultural Society, being also a constant exhibitor, and also at Richmond, Putney, and elsewhere. Mr. Newell was a native of Norfolk, and when a lad he developed a taste for gardening. When nearly eighteen he made and exhibited a model garden at an exhibition of the Stow Horticultural Society, which attracted the attention of Lady Hare, and led to his being taken into the garden of Stow Hall under Mr. Orr. Here he remained for five and a half years, eventually becoming foreman; and left there to take charge of the gardens at Fairlawn—a position he filled up to the day of his death, a period of twenty-four years. Fairlawn had, a few years previously, been laid out by Sir Edwin Saunders, from plans furnished by the late Mr. Marnock, and here Mr. Newell found ample scope for his abilities, and was able to add many finishing touches from time to time. He was a good all-round gardener, and did a good deal of exhibiting in his day, and had always admirably-grown subjects, such as Chinese Primroses, Begonias, &c., and the conservatory at Fairlawn was always bright with flowering and foliaged plants. He leaves a widow and son. He was laid to rest in Putney Vale Cemetery on Monday, the 16th inst.—R. D.

**Appointment.**

Mr. Frank Fennimore, for the last thirteen years head gardener at The Wyldes, Hampstead, has been appointed head gardener to M. Catty, Esq., Myrtlewood, North End, Hampstead.

**Canadian Apples for England.**

It is stated by the "Canadian Gazette" that, owing to the annually increasing acreage of orchards in Canada and the facilities for shipping, together with the unprecedented demand in England, incidental to the total failure of the home crop, the imports of Apples from Canada during the season 1903-4 may reach 1,500,000 barrels. Nova Scotia has 500,000 barrels to send.

**A Wise Tree-planting Scheme.**
